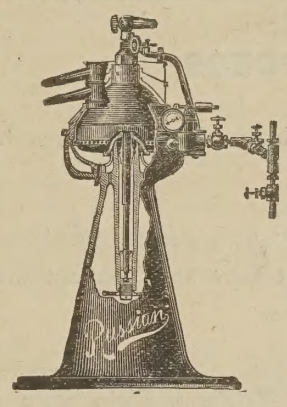
Medals—Bronze 1878, Silver 1887, World's Fair 1893.

"The Kind That Keep New."



The following unsolicited letter from one of our largest customers is very gratifying to us. Burnap & Burnap, of Toledo, Ohio is one of the greatest, most reliable and oldest firms in the creamery constructing business and have always bought the highest class goods, wherever made, regardless of first costs.

"Toledo, Ohio, Jan. 16th, 1899.
HANEY-CAMPBELL CO.,
Dubuque, Iowa.
Gentlemen:—The plant we built at Hammersley Fork was supplied with your new natural wood finish Vats. Our builder, Mr. Kite, states without solicitation that they are the finest vats he has ever looked at. Yours truly,
BURNAP & BURNAP."

THE BEST costs but little more than the poorest, but lasts many times as long. When buying **Vats, Churns, Workers,** or other dairy or creamery goods, always specify goods from
HANEY - CAMPBELL CO.

PRINT BUTTER SHOULD BE WRAPPED IN **GOOD PARCHMENT.** (Not the Cheap Kind.)
YOUR NAME OR CREAMERY, should be printed on every sheet. Send Name and Address for Sample Sheets to
DEPARTMENT H,
Paterson Parchment Paper Co., Passaic, N. J.

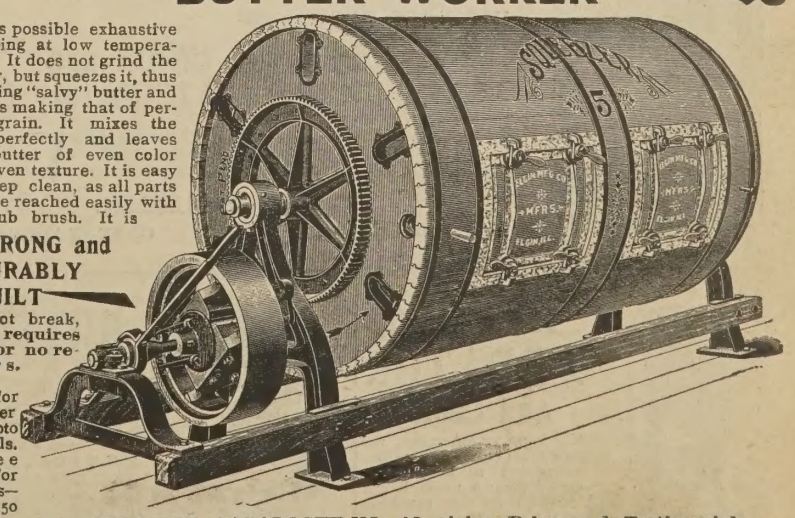
Your Neighboring Creamery

May use a Sharples Separator. If it does, it possesses certain very positive advantages over you. In the first place the Sharples separators require no expensive power plant to run them. You are saved the great expense of buying and maintaining an expensive engine, as the

Sharples Russian Separator

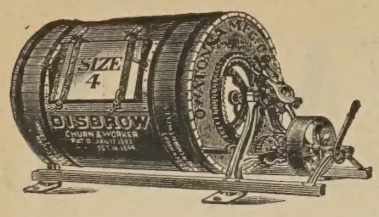
is run by a single jet of steam direct from a very cheap and simple boiler. Then they are so simple in construction and contain so few parts that there is practically no breakage, which brings the ordinarily expensive list of repairs down to almost nothing. By their construction they require but little oil, which is another item of saving. All these features bring the cost of manufacturing butter to the minimum and leave a consequent larger margin of profit. The Sharples Separators are the only smooth skimmers.—That means that they produce cream of remarkable smoothness, absolutely free from bitter froth, and leave the butter globules unbroken and in the best form for exhaustive churning. Think over these points. They save many dollars within the year. Other information and circulars free.

BRANCHES:— Toledo, Ohio. Elgin, Ill. Dubuque, Ia. Omaha, Neb. St. Paul, Minn. San Francisco, Cal.



P. M. SHARPLES, West Chester, Pa.

The "SQUEEZER"
COMBINED CHURN and BUTTER WORKER



Makes possible exhaustive churning at low temperature. It does not grind the butter, but squeezes it, thus avoiding "salvy" butter and always making that of perfect grain. It mixes the salt perfectly and leaves the butter of even color and even texture. It is easy to keep clean, as all parts may be reached easily with a scrub brush. It is

STRONG and DURABLY BUILT

will not break, and requires few or no repairs. Five sizes for creameries, 300 to 700 gals. Three sizes for dairies—50 to 150 gallons.

SEND FOR CATALOGUE NO. 40 giving Prices and Testimonials.
ELGIN MANUFACTURING CO., - - Elgin, Ill.

SUCCESS

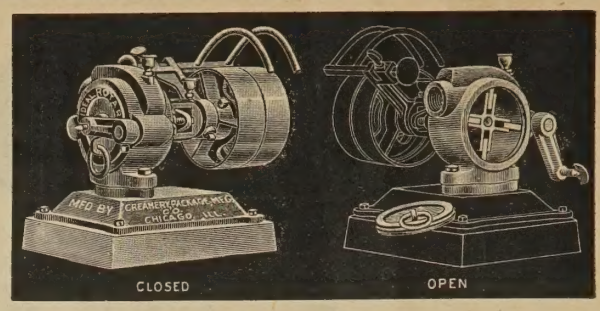
This is the magic word that marks the limit of every man's aspiration. Men who have and men who will achieve success are those who take advantage of every faculty which the world affords in their particular line.

...The DISBROW

COMBINED CHURN and BUTTER WORKER.

IS ITSELF A SUCCESS,

And will promote the success of every man or institution which uses it.



It will make *more* and *better* butter than any separate machines. Nearly all the premium butter exhibited at fairs and conventions during last year was made in these machines.

We have made some . . .

IMPROVEMENTS

in our

IDEAL

ROTARY MILK PUMP

Which was thought to be already perfect by large numbers of our customers.

We have simplified the construction without changing the general lines. It now has only one thumb screw to loosen to take off the cylinder head.

It has large capacity. Is very durable. No trouble to clean. Made in three sizes.

"Ideal" Jar Cup Finish.

In Our MILK DEALERS' SUPPLY DEPARTMENT

Can be found everything necessary for the Dairy or Milk Depot. Try our "IDEAL" Milk Jars and Caps. We know our Jars are stronger, of better shape and color, than any other. Write for our special Milk Dealers' Price Current. Also our little booklet, "Suggestions to the Milk Dealer," FREE.

Printed Pulp Cap.

Alpha De Laval Separators, Ideal Skim Milk Weighers, Elgin Style Ash Tubs, Spruce Australian Butter Boxes, Ideal Turbine Testers, Stearns Style Spruce Tubs, Ideal Corrosive Sublimate Tablets, Refrigerating Machinery, Ideal Cleansing Powder, Etc., Etc.

Premium Butter

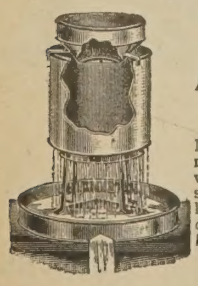
More than half of the Wisconsin Butter at the World's Fair **THAT SCORED 100 POINTS** was salted with VACUUM PAN SALT. More than three-fourths of all Premium Butter at Wisconsin State Fairs during the last five years was

Salted with

VACUUM PAN SALT.

BUTTERS & PETERS SALT & LUMBER CO.,
LUDINGTON, MICH.

A Great Mystery Solved.



The reason why so much poor milk is delivered to the creamery or cheese factory is that it is allowed to be drawn in railroad, or narrow necked cans, which are absolutely impossible to keep clean.

USE NONE BUT

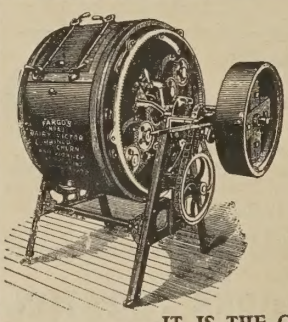
OPEN TOP UNION and EMPIRE STATE Factory Cans,

Which can be kept ABSOLUTELY CLEAN and PERFECTLY VENTILATED. Made of heavy tinned steel, any style top or center hoop.

OAKES & BURGER,
Sole Manufacturers, - - - CATTARAUGUS, N. Y

The YOUNG AERATOR And Cooler

Needs no water or ice, removes all odors and gases, warranted to keep milk sweet from 6 to 12 hours longer than any machine on the market or money refunded. Circulars free,
W. H. YOUNG,
Box 135, Aurora, Ill.



WINTER BUTTER

may be just as good as that from June grass if you know how to treat the milk.

The **PERFECTION** MILK COOLER AND AERATOR will take out all the bad odors and flavors resulting from winter stabling and feeding. They cost but little but are invaluable in the dairy. Write for FREE Circulars.

L. R. LEWIS, Cortland, N. Y.

THE DAIRY "VICTOR" Churn.

This Combined Churn and Butter Worker is proving itself to be precisely what the farmers and dairymen have been seeking after. It's work is as complete as the work of the "Factory" Victor Churn, which is rapidly supplanting every other Combined Churn and Butter Worker.

IT IS THE ONLY SUCCESSFUL DAIRY COMBINED CHURN AND BUTTER WORKER ON THE MARKET.

It is easy to handle, easy to clean, perfect in its work, durable and reliable. It charm every farmer and dairyman who sees it work. Manufactured by . . .

F. B. FARGO & CO., Lake Mills, Wis.

Subscriptions in United States and Canada $1.00 per year; 6 months 50 cents; 3 months 25 cents.

Foreign Subscriptions may be sent through Sampson Low, Marston & Co., St Dunstan's House, Fetter Lane, London, Eng, or their agents, including the leading news dealers and book sellers in nearly all foreign countries.

All countries in the Postal Union $2 04 a year; not in the Postal Union $2.56.

Correspondents must not expect us to acknowledge the receipt of letters containing remittances for subscriptions. The receipt of the Dairyman is sufficient notification that the money has been received. The label on the paper will show date to which subscription is paid. In case of renewals if date on label is not changed within two weeks after remittance is sent, inform us at once.

Remit by draft on Chicago or New York, or Post Office or Express Order; never by personal check.

ADVERTISING RATES.

Twenty-five cents per line, (agate measure) 14 lines per inch, each insertion.

Reading notices, 50 cents per line (nonpariel measure) each insertion.

Secretary Coburn states that the average Kansas cow returns her owner in cash $9.65, while the more intelligently fed cows of Kansas creamery patrons average $20 per head. The college scrub herd yielded $32 per head and the best one paid $60.

The above figures furnish their own lesson. It remains to be seen if the Kansas dairy farmer will profit by it.

We can never prophesy what strange combinations we may be forced to buy as butter. It has been found that glucose acts as preventive of decomposition when added to butter in the proportion of about ten per cent. As glucose is worth but three to four cents per pound, and butter fifteen to twenty-three cents, the addition of ten per cent of glucose is well adapted to increase the profit as well as the keeping qualities of the article.

The above is certainly better and more healthy than boracic or salicylic acids; but somehow if additions must be made to butter, either as adulterants or preservatives, we prefer to buy them separately and do the mixing ourselves.

THE RIGHT WAY OF POOLING MILK OR CREAM.

We notice that the patrons of the Amherst, Mass., creamery are seriously discussing the propriety of adopting the Babcock test in place of the space system, which now prevails among them. The report says that the space system will be continued with those patrons who prefer it. Why they should prefer it, is incomprehensible to those who have studied the better and more truthful way of the Babcock method. The Dairyman would suggest that the space patrons be kept by themselves. In a short time we believe the distinction which is bound to show itself will teach them the unreliability of their present method of pooling results.

When the Hoard creameries of this city introduced the Babcock system, in 1891, the same opposition was shown, but it came principally from those patrons whose cows gave milk of a low per cent of fat

To accommodate the situation to their notions the following compromise was made: All those whose milk tested above 4 per cent fat, would receive by the Babcock test; those whose milk tested under that per cent were accordingly allowed to pool their milk in another vat by weight.

It was somewhat amusing to note the result. The patrons furnishing rich milk were well satisfied. The others soon tired of each others company, for there was nothing to be gained in such association, and it was not long before they were willing to come into the general whole on the Babcock plan. In six months the average fat content of all the milk was raised from 3.97 per cent, for five years previous, to 4 31 per cent. Where this extra butter fat came from has not yet been clearly explained. Some of it, no doubt, was due to the elimination of the "moral hazard," but in the main, we believe it was due to the fact that the Babcock placed every man on his own responsibility, face to face with himself, and gave him full credit for all the fat he brought to the general pool. That fact caused him to dispose of the cows that gave "thin" milk, made him feed and care for his cows in a better manner, and put creamery and patrons both on an upward grade.

A New Holstein-Friesian Record.

Milk Tests 6.3 Per Cent Fat.

Ed. Hoard's Dairyman:—The heading will doubtless bring forth an incredulous smile on the face of many a reader of your paper. A perfectly preposterous claim, they will say. And still it is so. Not that I think that there is a Holstein cow that will test regularly 6.3 per cent; it would be difficult to find a cow of any breed testing normally as high as that when in full flow of milk. But the particular cow I am talking about tested on the morning of January 3rd, this year, 6.3 per cent, and gave a large mess of milk at that, viz.: 18 lbs. At noon the same day she gave 15.5 lbs. of milk testing 5.2 per cent, and in the evening 17.2 lbs. testing 5.6 per cent. Pretty rich milk for a Holstein, isn't it? Yield for the day, 50.7 lbs. of milk and 2.90 lbs. of fat, average per cent of fat in full day's milk, 5.73 per cent.

The name of the cow is Duchess Ormsby, H. F. H. B. 16004, owned by W. H. Jones, of Hustisford, Wis. She was entered for competition in the "Officially Authenticated Butter Tests", of the Holstein-Friesian Association, and was tested during a seven day period, Jan. 3-9 inclusive, by Mr. Chas. A. Nicholas, as representative of this Experiment Station. As I believe the test has more than ordinary interest, I have obtained permission to publish it in detail at this time, and give the yields of milk and of fat from the record subscribed and sworn to by Mr. Nicholas.

It will be noticed that the cow gave 19.418 lbs. of butter fat during the seven days the test lasted, and that the average test for the whole period was 5.44 per cent. On the first morning of the test, the milk of the cow contained 6 3 per cent of fat; the noon milking of January 8 tested 6.2 per cent, while the noon milking January 7 and the morning milking Jan. 9 tested 6.0 per cent. Four times during the test therefore this cow did what nobody would suspect a Holstein cow of doing—when in full flow of milk she gave a mess of milk that tested six to six and three-tenths per cent of fat.

I suppose that Superintendent Hoxie, in charge of the Holstein butter tests, on receiving the results of this test, had a premonition that doubting Thomases would arise who would refuse to accept the test as correct. At any rate, he evidently desired to make assurance doubly certain, for shortly after the close of the test, Director Henry received a letter from him asking that he send "some one on whom he (H.) can absolutely rely," to test a few milkings of the cow. As I could better the work in hand so as to leave for a day or two, it was decided that I should go to Hustiford, and Mr. Jones was informed that I would be at his place a couple of days afterwards (Jan. 19). It was not expected that the cow should give as much milk as during the test, but it seemed reasonable to assume that her milk would show nearly, if not quite, the same average per cent of fat as before.

I spent a part of January 19th and 20th at Mr. Jones' farm, two miles southeast of the village of Hustisford, in Dodge Co.; saw the cow milked three times and sampled each milking with the greatest care; locked up the samples in my grip as soon as taken, and only took them out of it when the test could be proceeded with. While it probably was not agreeable for the owner to see all these precautions being taken and to have his every movement while near the cow closely watched, I took it that that was what I was there for, and acted accordingly. The test of these three milkings, with yields of milk and of butter fat produced are shown below:

	Milk, lbs.	*Test.*	*Fat produced, lbs.*
Jan. 19, 8 p. m.	15.0	4.7 p ct	.705
Jan. 20, 6 a. m.	21.0	3.9 p ct	.819
Jan. 20, 1 p m.	17.0	5.2 p ct	.884
Total.....	53.0	...	2.408

Average test, 4 54 per cent.

Contrary to expectations, the cow gave more milk than during the 7 day test, and the fat content was one to two per cent lower. The total production of butter fat was, as a result, decreased by about a third of a pound. A bit of information which leaked out, throws light on the low test of the morning milking of January 20. The grain feed had been changed the preceding morning from slop to dry feed (bran and oats, half and half), presumably because it was thought that the cow would do better when fed as she had been during the seven day test. The amount of grain fed was not increased, I was told. The nervous theory of *ye Editor* could not, it would seem, be more nicely illustrated than by this little incident. The supposition that the change in the system of feeding brought about the drop in test—beyond what would be expected as a result of the larger milk yield—is backed up by the gradual return to higher tests on the following days, when the cow had again become accustomed to the dry grain; her test for the morning of January 21 was 5.2 per cent, (milk yield 25.0 lbs.), and for the same milking Jan. 22, 5.4 per cent, (25.0 lbs. of milk).

The following evidence is of value in forming an opinion of the correctness of the 7-day test. The composite sample taken during the test by Mr. Nicholas was forwarded to Madison and found by Mr. Decker to contain 5.45 per cent of fat; average fat content, according to single tests made at the farm, 5.44 per cent (see above). Furthermore, Mr. Jones took composite samples of Duchess' milk the week following the test, which contained 5.2 per cent fat. The cow, during this week, on reduced feed, produced 402 lbs. of milk, and consequently 20 904 lbs. of butter fat. Of course, these figures are not officially subscribed and sworn to, but I have every reason to believe that they are substantially correct. The cow, therefore, produced more milk, and as much, if not more, butter fat the week following the test than during this week.

The following extract from my letter to Superintendent Hoxie, dated Jan. 21, is self-explanatory:

"From the results obtained in this brief test of mine, and from a most thorough investigation of the conditions under which the results of the seven-day test were obtained, as well as from my knowledge of the care with which Mr. Nicolas worked, I have no hesitation in stating that I believe the cow did all her test shows her to have done, and that her milk did repeatedly contain six per cent of fat or more, during the test."

This test is, in my opinion, of great importance to the dairy public at large. It not only shows that Mr. Jones has a wonderful cow, one that is second to few in productive capacity, and perhaps second to none as regards economic production, but it shows that we can look for cows producing a large quantity of rich milk in the Holstein breed, as well as among the breeds that are justly famed in this respect. While Duchess of Ormsby did not reach the highest official record for butter fat in seven days, this being held by Netherland Hengerveld (H. F. Reg. 13,106) viz: 21.333 pounds, she gave milk during the test, the average fat content of which exceeded that of any previous official Holstein test, by over one-half per cent, and exceeded the average test of all cows entered in any one year, by more than two per cent. Her highest test, 6.3 per cent, is also one-tenth of one per cent higher than the maximum test of previous years, and over one-half per cent higher than the highest single test generally runs. The tendency during late years has undoubtedly been toward raising cows producing rich milk, and I believe the test of Duchess Ormsby will have a wholesome effect in drawing the attention of breeders to the necessity of breeding along this line.

Only a few words about Duchess of Ormsby. She was bred by Mr. J. Rust, of Greenfield, Wis., her sire being Uncle Hicks 6th (6154), and dam, Piebe 2nd (7402). She was dropped Feb. 12, 1889, and is therefore now nearly 10 years old. She calved Dec. 26, 1898; at the beginning of the test she had, therefore, only been 8 days in milk. She is a strikingly fine cow in appearance, of pronounced dairy type, with an enormous udder, which showed but poorly in the photograph I saw of her.) She is a large cow, weighing, perhaps, not far from 1500 pounds. When in milk, I was told, she cannot be fattened, and that is why she is a dairy cow.

TO THE MEN WHO DON'T TAKE HOARD'S DAIRYMAN.

Mr. J. Moldenhawer, of Washington, D. C., is a highly skilled dairyman. He is engaged in producing the finest of milk for the highest paying demand. Mr. J. C. Jurgensen, of Brooklyn, N. Y., in writing to us in the issue of Sept. 23, concerning a visit he paid Mr. Moldenhawer, says:

"Mr. Moldenhawer is himself picking out Hoard's Dairyman before any other of the many farm papers he keeps, and he frankly says that your great paper is of high value to him. When a man with his reputation says so, how can the farmers who expect to make money by keeping cows for dairying, get along without the Dairyman. Still it is a very trying job to try to convince farmers how much it would help them to keep an extra good dairy paper."

What is the lesson that the above teaches? This: That no man who is keeping cows for profit can afford NOT to have such a friend and adviser as Hoard's Dairyman at his elbow every day in the year. Simply put a dollar bill in a letter with your name, post office, county and state plainly written on a piece of paper, and mail it to us, and secure the paper to Jan. 1, 1900.

Coming Events.

American Tamworth Swine Record Association Flint, Mich., Feb. 20th, 1899

HUMAN milk differs considerably from bovine milk in its action in digestion. This is seen in the effect of rennet upon both. When rennet is added to human milk, the casein coagulates in fine flakes, making it divisible and easily acted upon by the digestive ferments in the stomach of the infant. In cow's milk the coagulation takes place in a more solid form, and the casein sinks to the bottom in the whey. The milk of stripper cows, over three months in gestation, should not be fed to young children, as the gestative process takes from the milk the finer flavoring oils which seem to have a peculiar function in the growth of the brain and nervous system.

A SECOND DISSATISFIED INQUIRER.

A subscriber, at Belvidere, Ill., writes us that a young man near there tried one of our ration formulas, and his cows fell off two cans of milk daily and is now "down on the editors, the paper, and its teachings."

All we have to say in reply to this is that the young man referred to is to be pitied, as he is only advertising his own folly. If it were an established fact that the formula referred to was defective and of itself caused the shrinkage,—which we by no means concede—it would not follow that all the other matters published were valueless.

Oftentimes the feeder is as much at fault as the feed. It cannot be expected of us to repeat with each formula submitted detailed instructions as to the manner of feeding, and the folly of making abrupt changes. Neither is it to be expected that we are so unlike other men that we can always avoid errors either in judgment or expression. If the direction we have so frequently repeated, about giving the cow all the hay or other roughage she will eat, is adhered to, there is no sufficient reason why any formula we have ever published should result in a decreased yield, that does not at the same time show an increased net profit.

NEW JERSEY AUXILIARY DAIRY UNION.

At the recent meeting of the New Jersey Board of Agriculture, a State Dairy Union was organized as an Auxiliary to the National Dairy Union with the following officers: President, J. A. McBride; Vice-President, J. P. Mattook, Treasurer, Chas. Howell Cook; Secretary, G. L. Gillingham.

We beg to acknowledge, with thanks, the receipt from Secretary Cook, of Trenton, the sum of $46 as the first contribution of the new Auxiliary to the funds of the parent Union. The friends of pure butter have a long bitter fight ahead of them in Congress in support of the measure to tax all substitutes of butter 10 cents a pound, that are made to resemble butter in color.

It is a fight of the honest consumers against fraud, dishonesty, and wholesale swindling. This fight cannot be conducted by the individual farmer on his farm and he knows it. But he can do two things, so simple and easy, that we fear he overlooks them. That is, he can send a dollar to HOARD'S DAIRYMAN as a membership in the National Dairy Union, which is organized to push National and State legislation against this great fraud. Second, he can sit down and write a letter or postal card to his member of Congress, and the two senators from his state, telling them what he thinks they ought to do in the matter. Every such letter adds a stone to the heap. Let no man despise his gifts.

There are thousands upon thousands of people to-day paying a butter price for a fraud called oleomargarine. The whole of this business is conceived in fraud, and depends on fraud and deception for its success. It can only be fought by organized effort. Every farmer owes it as a patriotic and personal duty to help the National Dairy Union fight this common enemy of both the producer and consumer. It should be remembered that the officers of the National Dairy Union serve the cause without a dollar of salary. Besides, they have expended hundreds of dollars of their own money in visiting Washington and state legislatures and in correspondence to help along the cause.

It is not fair nor manly for the dairymen of the country to stay back in indifference and let a few men fight forty millions of Stock Yard capital, in their defense. Every dollar contributed is honestly and wisely expended, mostly in arousing the dairyman in different states to exercise their own influence with their law makers in behalf of good laws.

TAXING OLEOMARGARINE.

All dairymen and all consumers of dairy products have reason to be profoundly grateful to representative Davidson for introducing his bill to so increase the Federal tax on oleomargarine that resembles yellow butter that its further sale to the ultimate consumer for what it is not will be an impossibility. The recent arrest of several hotel proprietors at Superior in this state furnishes an unanswerable argument for the speedy enactment of this bill into a law. There are very few people, in fact none, who would take oleomargarine from choice, and especially at the full price of butter, and yet at least nine-tenths of all the oleomargarine sold goes into consumption upon the theory and supposition that it is butter.

This is a most stupendous fraud upon the consumer and fully justifies the exercise of any legitimate power conferred upon Congress to put a stop to it. The most effective and the cheapest way to accomplish this is to tax it out of existence.

It is probably too late to obtain final action upon the bill at this session of Congress, but Mr. Davidson has been re-elected, and when the next Congress convenes he will reintroduce the measure and should have the active support of all classes of people,—except those who seek to grow rich by being accessory before the fact to the perpetration of deceit and fraud.

A SILO DISCUSSION.

At a farm institute in Wisconsin, the following discussion on ensilage and other things was had.

C. P. Goodrich—Economical feeding is what we are after. It is true the corn crop will produce more cow feed than any other crop per acre, and I don't believe it pays a man to husk and grind corn for cows, but I know it pays to cut it up and put it in the silo, because we have it in succulent form, which stimulates the production of milk, and we get the feed very cheap. It costs me three days' work to the acre, to harvest a crop of corn and put it in the silo, grain, fodder and all. It can be fed without any waste, and the cows never held out in the flow of milk through the winter so well, as they have since I have had a silo.

Question—Mr. Goodrich, has your corn any more nourishment in it after it comes out of the silo, than before it goes in?

Mr. Goodrich—I don't think it has.

Question—Has it as much?

Mr. Goodrich—I think it has.

Question—What is the per cent of loss?

Mr. Goodrich—About eight per cent when the conditions are the very best.

Mr. Convey—What is the per cent of loss in corn fodder?

Mr. Goodrich—As farmers usually do it there is a loss of fully one-half.

Mr. Convey—Suppose this corn is cut at the same time that you cut it for the silo, bound, properly cured and stacked or housed, and then cut the same as you cut it for the silo; is it equal to ensilage?

Mr. Goodrich—No, not for milk cows, for we all know that succulent feed is good to stimulate the flow of milk. There is nothing in the world so good as fresh succulent grass. We cut that grass and dry it ever so carefully, and it will not produce milk nearly so well as grass. You may say, nothing has gone out of it but water, but all the water in creation will not make it grass again—the natural juice of the grass has gone out of it. It is just so with corn fodder. If we have preserved that, we have preserved something that cannot be preserved in dry corn fodder.

Prof. Henry—We have experimented at Madison upon the point, with reference to the loss in curing corn fodder. We find that the loss reaches twenty-five per cent easliy in well cured, shocked corn. We have taken shocks of corn, carefully carried them to the barn, and put them in the barn, standing there as shocks, and found that they lose a great deal there; just why is a mystery. It is probably a slow fermentation that goes on in that shocked corn, by which the corn loses more than in the silo.

Troubles Which Confront the Georgia Dairyman.

ED. HOARD'S DAIRYMAN:—I enclose you a check for DAIRYMAN for one year.

The low price of cotton has about broken all us cotton planters, so necessity compels us to adopt new methods. Some are in the ruts and will starve before they will raise their supplies and raise other things instead of cotton.

Some, however, are changing about, doing with less labor, planting small grain, fruit-trees, and paying more attention to stock and dairying.

I have had, for some years, a herd of Jerseys but, with the exception of a few years, did not give them the attention necessary for the reason that I was interested in other matters. Now necessity compels me to look to the dairy and my fruit for the source of profit from the farm. To succeed, I must have the DAIRYMAN to consult regularly, as I need all the help possible.

We labor under some difficulties now, but that will be overcome later on. We have few dairymen who understand their business as those we get from north or northwest are generally men that cannot get employment where they come from.

The other difficulty is the want of feed just now. Cotton absorbed all the land and attention up to this date, but within a few months we can have feed in abundance.

I wish to ask you some questions as to what is best to grow for winter feed.

We can grow oats cheap, can make some 30 to 100 bushels per acre, then plant the same land, after harvest, in corn for ensilage, and the cow pea for the same purpose or for the peas for ground feed. I should think the pea vine gathered just before the peas ripen, mixed with corn, would make a fine ensilage. What do you think of it?

Would ground oats fed with such silage make a balanced ration?

Here in middle Georgia we can raise all the clovers, vetch, cattail millet and all the other millets to perfection. Rye grows well all winter. My patches stand six inches high now and I have been grazing them every dry spell since November. J. T. D.

Meda, Ga

It would be a difficult matter to make a first class ration with corn and cow pea silage and oats, notwithstanding the corn and cow peas make excellent silage. In the first place, cows need some dry fodder with the silage. Oat straw would furnish this fairly well, but it would leave the protein too low. Clover hay is the ideal complement to silage. for roughage, but as that cannot be had for next winter, there should be some pea vine hay. This and oat straw would do very nicely. Then there is the cotton seed meal, not quite worth its weight in gold, or even in silver, but extra valuable both for feeding and for enriching the manure, the latter by no means an inconsiderable item, especially with people who propose to raise two crops per year from the same piece of land. The soil must be fed or it becomes practically barren after a few years of cropping.

Our ideal ration for next winter would be a daily allowance of about 30 lbs. of silage, 6 to 10 lbs. cow pea hay, oat straw *ad libitum*, 2 lbs. cotton seed meal and 4 to 6 lbs. ground oats. When there is grazing, less silage and hay will be required.

A Remedy for Bloat.

ED. HOARD'S DAIRYMAN:—Reading the article from W. R., Hebo, Oregon, on page 993 in regards to bloating, I thought perhaps a remedy I used might be of use. One evening my cow bloated, I took down my Special Report on Diseases of Cattle and Cattle Feeding that I received of the Agricultural Department and found a prescription that would have taken me one hour to get filled and instructions how to use a surgical instrument, called a trocar. I had no trocar, and I might have been two hours getting a veterinarian, so, I went to a neighbor that I knew had lots of experience with horses, and he said, let us try a rubber tube. I asked what he meant, and was told that my friend had used a ½ inch rubber tube on horses and he could not see why it would not work on a cow.

We had no ½ inch hose so we got about 3 feet of ¾ inch garden hose, greased it well and pushed it in the cow's rectum about 16 inches. Then we pressed her sides and you could see the gas come out every time we presses her sides. Inside of an hour she was quite loose, i. e., her skin was loose. When we began she was tight as a drum.

I think the bloat was caused by feeding too much middlings and corn meal. I was feeding about 9 lbs. middlings and 3 lbs. corn meal. Before going to bed I gave the cow ½ lb. of Epson salts in a beer bottle full of warm water. It worked all right and have had no trouble since.

I have since learned that a half pound of bi-carb soda will relieve a cow with bloat caused by stoppage of the bowels, inside ½ hour. Hope I don't have to try it.

FRANK M. WARNER.

Los Angeles Co., Cal.

The Wisest and Best Dairy Farmers

— IN AMERICA —

Read HOARD'S DAIRYMAN.

They all agree the paper is worth to them many times its subscription price.

How did they become wise and prosperous in dairying? By making themselves intelligent on this dairy question.

There is the same chance for every man who would make a profit from cows.

Subscribe for HOARD'S DAIRYMAN. Only $1 a year. Fill out the subscription blank, enclose One Dollar, and try your fortune.

How does the illustration on the preceding page conform to the record reported by Prof. Woll? The "dairy form" is not every thing, but it is something like charity, in that, without it other virtues do not amount to very much. How much more testimony must be given before even the most stubborn adherents of "square-endedness" will concede that the so called "Wisconsin Idea" is not a chimera or will-o'-the-wisp. It is not simple coincidence that the best cows conform to this "idea," but the relation is what Prof. Russell would call "causal."

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name Post-office and state of writer. Condense the questions into plain specific inquiry. Be careful to note if your questions have not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

FEEDING STANDARDS FOR MILCH COWS.

Dry matter.	DIGESTIBLE NUTRIENTS Protein	Carbohydrates.	Ether extract.
lbs.	lbs.	lbs.	lbs.
23 to 28	2.0 to 2.5	12. to 15.0	0.5 to 0.8

THREE PENNSYLVANIA QUERIES.

1. Is it true that twin calves are barren in case the twins are a pair?

2. Did ever a case come to your notice of a bull tearing his nose with his ring when tied or led by the ring? Is it possible for him to "slit" his nose out?

3. Kindly give me the address of a good reliable breeder of roan Durham cattle, preferably in this state, or in an adjoining state. D. L. M.

Meyersdale, Pa.

To the first question, we answer, No; to the second, Yes; and to the third, that we have no information on the subject. We should suppose that parties having such cattle for sale would advertise them. But as they do not do it, possibly D. L. M. might get into correspondence with them by inserting a "Want Ad." in this paper.

A PENNSYLVANIA RATION.

Will ask for a ration from corn and cob meal, wheat bran, and oat chop for grain feed, and ensilage, well eared, but cut a little old, mixed hay and corn fodder for roughage.

The man who buys a large cow because of size is like the man who buys a large stove simply to get more out of it as old iron, after its days of usefulness.

I thank you for your past interest in us, and hope your paper may still continue an enlightener on the dairy question.

Chester Co., Pa. T. M. B.

When limited to the feeds named, we can do no better than suggest as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates	Ether Extract
25 lbs. silage	6.60	.33	3.50	.18
10 lbs hay	8.58	.48	3.96	.16
4 lbs. bran	3.52	.50	1.54	.12
4 lbs. corn and cob meal	3.56	.26	2.52	.14
2 lbs. oats	1.78	.18	.95	.08
2 lbs. corn	1.78	.16	1.33	.09
Totals	25.82	1.91	13.80	.77

A better ration, and probably costing less, would be had by substituting 3 lbs. gluten feed, or 2 lbs. cotton seed meal for the 4 lbs. corn and oat chop. In either case, some of the corn stover may be substituted for a part of the silage or hay or both, and always give all the roughage the cows will eat, be it more or less.

A CONNECTICUT RATION.

Do you consider the following ration a good one for milch cows; would it be too strong feed? Daily ration: 2 lbs. wheat bran, 2 lbs. wheat middlings, 2 lbs. corn and cob, 1⅔ lbs. gluten feed (Buffalo), one and one-fifth lbs. ground oats, and all the hay they will eat. W. W. B.

Bridgeport, Conn.

Assuming that these cows will eat 20 lbs. of timothy hay in addition to the grain mentioned, we have the following figures:

	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates	Ether Extract
20 lbs. timothy hay	17.36	.56	8.68	.28
2 lbs. bran	1.76	.25	.77	.06
2 lbs. middlings	1.76	.26	1.06	.07
2 lbs. corn and cob meal	1.78	.13	1.26	.07
1⅔ lbs. gluten feed	1.54	.34	.81	.05
1 1-5 lbs. oats	1.07	.11	.57	.05
Totals	25.27	1.65	13.15	.58

Here the protein is much too low. If the hay happens to be clover, or even mixed clover and timothy, this deficiency would not exist and we might call it a very good ration.

It certainly is none too much for a cow that has not passed into the stripper class. With timothy hay, the gluten feed should be at least doubled.

WHICH BREED AGAIN?

What breed of dairy cattle has given the best results in Wisconsin, when product is sold by the Babcock test?

This is a question a great many of us are interested in, and if you could give us an answer, we would appreciate it very much.

Liberty, Ind. T. C. B.

This is practically the old question, but put in a different way. We could say, very truthfully, that there is absolutely no data to be had upon which to base an answer, and there are as many opinions as there are breeds. It stands to reason that the owners of Guernseys and Jerseys and their grades are more anxious than others to have their milk paid for by the test, and as the Jerseys greatly outnumber the Guernseys, it is but reasonable to expect that we hear more about them.

But when it comes to individual herds and individual cows, candor compels us to say, that sometimes one breed leads, and sometimes another breed will be in advance. There are not only good cows in every breed, but very often superior cows. The present writer's choice happens to fall upon Jerseys. They please his eye; they please his boys; one of the results is that they receive considerate attention and good care. A near neighbor on the north can see neither comliness nor merit in anything but Holsteins, while one less than a mile south has a decided preference for Guernseys. No one knows which is the most profitable herd, as a whole If perchance there is one cow in the writer's herd that surpasses all others in the three herds (which is by no means certain) it is certain that there are individual cows in the neighboring herds that are more profitable than the average cow in his herd.

The question does not admit of an answer, except to say that one can get good, even excellent, animals out of any breed, and the proper course for each man to pursue is to select the breed which suits him best, and from that breed select the best. These are not always those for which the most money is demanded. Study the dairy form and have an educated intelligence to guide in making selections.

RATION FOR AN ILLINOIS MILKMAN.

I am shipping milk to Chicago, and want to know how to produce a large quantity of good pure milk as economically as possible. Will you kindly formulate a ration for my cows from the following feeds (they are mostly general-purpose animals with a few grade Holsteins; weight about 1100 lbs.): corn stover, timothy hay $8 per ton; wheat bran $14, gluten $15, corn 32 cents, oats 28 cents, oil meal $1.50 per 100 lbs., wet brewers' feed (fresh) $4 per ton. The wet feed is fresh when I get it, but it does ferment before I get it all used up. I hesitate about feeding it, although my customers do not find fault.

Mine is the only copy of your paper in this vicinity, but I hope to have one or two subscribers for you soon. W. C. O.

Mokena, Ill.

There are the following amounts of digestible nutrients in the food stuffs named:

100 LBS. OF	Protein.	Carbohydrates.	Fat.
	lbs.	lbs.	lbs.
Corn stover	1.7	32.4	0.7
Timothy hay	2.8	43.4	1.4
Wheat bran	12.6	38.6	3.0
Gluten feed	20.4	48.4	3.0
Corn	7.9	66.7	4.3
Oats	9.2	47.3	4.2
Oil meal	29.3	32.7	7.0
Brewers' grains (wet)	3.9	9.3	1.4

Tables like the above enable us to determine the relative feeding value of the articles named. In this particular case, they prove that there is no economy in buying the wet brewers' grains at $4, when gluten feed can be had at $15; and but little when compared with bran or oil meal, not to mention the risk and danger incident to fermentation. Timothy hay at $8 is pretty dear feed, but we are inclined to use some of it in connection with the corn stover as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates	Ether Extract
20 lbs. corn stover	11.90	.34	6.48	.14
5 lbs. timothy hay	4.29	.14	2.17	.07
5 lbs. gluten feed	4.61	1.02	2.42	15
5 lbs. bran	4.41	.63	1.93	.15
2 lbs. corn chop	1.78	.16	1.33	.09
Totals	26.99	2.29	14.33	.60

A NORTH DAKOTA RATION.

Please give a ration to feed with prairie hay of fair quality. Wheat bran $8, shorts $10, ground barley $13, corn meal $17, flax seed about $1 per bushel, oil meal about $30. Also ration to use when no corn meal is to be had. R. M. C.

North Dakota.

Neither shorts, barley, corn nor flax seed can profitably be fed at the prices named. Try the following:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates	Ether Extract
15 lbs. prairie hay	13.13	.53	6.27	.21
10 lbs. bran	8.81	1.26	3.86	.30
2 lbs. oil meal	1.82	.59	.65	.14
Totals	23.76	2.38	10.78	65

Probably most of the cows will eat more hay. Give them all they will eat.

A MISSOURI RATION.

From 225 Pounds to 308 Pounds.

You will please furnish a ration from the following feeds: Brewers' grains (wet) five cents per bushel; wheat bran, $11.00 per ton; corn bran, $10.00 per ton; millet hay, $7.00 per ton; well cured corn fodder in plenty.

I would like to say right here, that any man that runs a dairy for the profits he gets on his butter, can't afford to do without the DAIRYMAN, for I believe that without its help I would have been in the drag very bad. As it is, have brought out my cows from 225 pounds to 308 pounds per year, and the product is of that quality, that it received a score of 96 82-100 at the Missouri State Dairy convention, and for which I receive 22½ cents per pound the year round from one firm in this city. I find in circulating around on behalf of your paper, that you have a good many friends here, but got a few more interested, and sent you a small club, and will endeavor to get a few more.

Hannibal, Mo. S. C. T.

It is a good deal like "carrying coals to New Castle" to offer advice, for feeding, to a man whose cows bring him 308 pounds of butter per year, that sells at 22½ cents per pound.

If these cows are receiving now, say, about 10 pounds corn fodder, 10 pounds millet hay, 25 pounds wet grains and 6 pounds wheat bran, we do not know how the ration could be materially improved or cheapened, unless it could be done by some corn chop for a part of the bran or wet grains. If the latter, we would let two pounds of the chop take the place of five pounds of grains. But it is hazardous to do much changing when cows are doing well, as witness Prof. Woll's report on the test of the cow, Duchess of Ormsby, in another column.

IS A CENT WORTH SAVING?

We have plenty of clover hay, corn and oats on the farm.

My tenant thinks $10.00 bran is too expensive. How shall these be fed to make a good balance? B.

Indiana.

It appears to read very plainly in our friend's communication, "$70 bran", but we assume it was meant to be $10, and we undertake to say that at this price bran is a much more economical feed for cows than oats. To prove this we give two formulas as follows:

I.

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates	Ether Extract
20 lbs. clover hay	16.94	1.36	7.16	.34
5 lbs. corn	4.45	.48	3.34	.22
5 lbs. oats	4.45	.46	2.37	.21
Totals	25.84	2.22	12.87	.77

II.

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates	Ether Extract
Hay and corn as above	21.39	1.76	10.50	.56
5 lbs. bran	4.40	.63	1.93	.15
Totals	25.79	2.39	12.43	.71

Either of these rations will do very well, but the last is, if anything, the better, and by as much as 5 lbs. of bran can be had for less than 5 lbs. of oats, it is also the cheaper. This will not amount to very much per day for one cow, probably only about 1¼ cents, but for 20 cows it would be 25 cents, nearly $2.00 per week, and an item only a farmer can afford (?) to ignore.

Show a banker or a merchant how they can add that much net gain to their profits in a week and they will at once take measures necessary to secure it. But the farmer, and especially the tenant farmer, has been brought up to despise these small economies, with the result that he borrows money of the banker to pay his debts to the merchants.

ROOTS IN ARKANSAS.

I would like to have some information on growing root crops as I have no silo. I have rich branch land of black sandy soil old, or new, upland.

I like the carrot very well but would like something that I can plant later, in order to destroy more weeds before planting. Can I grow mangles this far south, planted in July?

Springdale, Ark. L. J. R.

The true practice in all cases of this kind is for one to experiment for himself We know of no reason why these crops will not grow to perfection in Aakansas. Possibly some of our readers in that state have tried the experiment and can answer from their own knowledge. If so, we should be pleased to have them do so.

We may add, however, that the reason assigned for wanting to grow root crops is not sufficient. A silo can be built at no great expense, and will easily pay for itself the first year, in economy and convenience.

PLAIN TALKS ON BACTERIA AS APPLIED TO FARM PROBLEMS.

[By Prof. H. L. Russell.]

Second Series, V.

GLOSSARY.

Epizootic is to animals what epidemic is to man. It means a contagious disease which occurs simultaneously among a number of animals.

Immune—An animal is immune, i. e., refractory to a given disease germ, when the organism in question is unable to grow in the animal but possesses the power to grow in other individuals or somewhat closely related species Immunity may be natural, i. e., possessed at birth, or it may be acquired, either by virtue of an attack of the disease, or by the artificial introduction of immunity producing substances into the animal.

Anti-toxic as applied to a serum, means a liquid that will prevent a toxin or poison from exerting its poisonous effect on the system of animal or man.

HOG CHOLERA AND SWINE PLAGUE.

The loss which is incurred in this country, more particularly in the great corn belt, from these two diseases, much exceeds that produced by any other single cause.

In the corn states these diseases are practically present all of the time, while it sweeps over various other sections at irregular intervals. The state of Iowa alone loses millions of dollars annually through this scourge, and yet, both of these maladies belong to a class that are known as preventable diseases, because they *can* be prevented if proper precautions are taken.

For the purpose of this paper, hog cholera and swine plague may be considered as one disease, as not infrequently the two affections are found simultaneously in the same herds.

It should, however, be borne in mind that they are not absolutely identical. Although both are specifically germ diseases, they are produced by different, but closely related, species of bacteria.

SYMPTOMS.

The general symptoms of the two diseases so closely resemble each other that frequently they cannot be differentiated, until a post mortem examination is made.

Often both run a very rapid course, in which case a fatal termination may be expected; again, they may assume a more chronic phase. This usually occurs in the later stages of an outbreak. In both diseases the skin on the under parts frequently takes on a purplish hue, and the animal shows signs of dullness. In swine plague a cough is usually present, constipation followed by diarrhoea frequently occurs.

In hog cholera the intestinal tract is the primary seat of the affection, although later, other tissues may become involved. In swine plague the most prominent lesions occur in the lungs. A pneumonia is generally produced, the air cells becoming solidified, in which condition they often appear like a section of the liver. A characteristic condition in hog cholera, especially in the more chronic cases, is the appearance of the peculiar raised ulcers or "buttons" in the large intestine. It is sometimes a difficult matter to properly diagnose these diseases as the symptons may vary materially in different herds.

CAUSE OF, AND CONDITIONS AFFECTING THE DISEASE.

These diseases are only produced when certain specific kinds of bacteria find their way into the animal. The organisms causing them are quite closely related to each other, but they are as much entitled to be classed as distinct germs as a raspberry and a blackberry are classed as different fruits. While the introduction of the specific germ is a necessary factor in the production of the disease, it must be evident that external conditions may modify the course and extent of the outbreak. It is quite generally believed that green or "new" corn is a cause of the disease. While this in itself cannot be a *cause*, it may be a strong predisposing factor. It is an established fact that hogs fed upon an exclusive corn ration do not attain to that degree of development that characterizes an animal raised upon a mixed diet, and that the power of resistance in various animals to the disease is largely diminished, if they are fed (exclusively) upon any single kind of food. These diseases of swine are generally intestinal troubles, and any disturbance of the digestive organs would therefore increase the susceptibility of the animal to the disease, a condition easily occurring when the animal is allowed to gorge itself upon any green or immature feed. Great care should be observed in changing the diet, especially if the change is to a highly palatable food, or one that is greedily devoured by the animal.

VARIATION IN VIRULENCE.

Under ordinary conditions much variation is to be noted in the virulence of different outbreaks of these diseases. This fact has often led to an erroneous diagnosis, the milder, and more chronic types not being recognized as especially dangerous. There are two sets of factors constantly at work to render this variation possible. One is the inherent tendency to vary in the germ which causes the disease; the other, the modifying effect upon the host of such external factors as climate, food, etc. Bacteriologists have for a number of years been able to study the germs of these diseases in a large number of epidemics, and they have demonstrated that not only do the two organisms of swine plague and hog cholera differ materially in their ability to cause disease, but that each species (especially hog cholera organism) does not possess the same degree of virulence in different outbreaks. Prof. Theobald Smith finds six different types of the cholera germ that vary materially in their ability to produce the disease. These differences constitute varieties, just as a Baldwin or a Greening apple is a distinct variety of the general species. Even though the external conditions are apparently similar (which never absolutely happens) outbreaks produced by the different varieties of the germ would differ in degree of virulence.

The variation normally observed in any section of the country is not, however, attributable to this cause, for the same type of germ is generally disseminated locally from farm to farm.

Epizootics or outbreaks generally bear in intensity a close relation to external factors. The general health of any given herd is in part dependent upon the way it is cared for, although it not infrequently happens that those animals that receive the most careful attention readily acquire the disease. They do so, however, not because they have been better cared for, but because they have had greater opportunities to receive the disease germ into their systems. Climate conditions, as temperature and moisture, undoubtedly exert some effect on the course of the disease. The usual unsanitary conditions that surround swine are such as to favor the distribution of the disease germs when once introduced. Hogs are naturally somewhat insusceptible to both of these maladies, as is evidenced by the fact that they resist inoculation with the pure cultures of the germs of both these diseases to a considerable extent. When the organism is introduced into the blood the disease is quickly produced. It is, therefore, evident that their normal insusceptibility is materially lowered as in the great majority of epidemics they fall an easy victim.

HOW SPREAD.

The recognition of the sources from which these disease germs spread is of the greatest importance, for a knowledge of these facts will often enable one to prevent the scourge from gaining access to a herd. As previously stated, hog cholera is primarily an intestinal disease, although the organism producing the same may be found in the blood and various organs of the body.

The virus of the disease is, therefore, discharged in the fecal matter and it is this excreta that is so dangerous.

If the disease once breaks out in a herd from any cause, its continued propagation is greatly facilitated by the natural habits of the animal. As soon as any animal shows the slightest signs of sickness, it should be immediately separated from the balance of the herd to prevent any further dissemination of the disease. These germs are able to live in filth and foulness for a considerable period of time. The germ of hog cholera is considerably more resistant than that of swine plague. The effect of natural surroundings (drying, sunlight, and competition with other decomposition bacteria) usually destroys the virus of swine plague in a few weeks or so, but that of hog cholera will resist the same exposure for a number of months.

It is therefore necessary to destroy the seeds of the disease contained in this material, before it is safe to use infected quarters again. This can only be done by a thorough disinfection of the pens and yards. The detailed methods to be employed will be given in a subsequent article which will treat the subject from a general standpoint.

The disease germ may be inadvertantly introduced into a herd in a variety of ways. Indirect contamination from affected animals may be carried by a person. A farmer in a community has an outbreak of the disease. Immediately his neighbors become desirous of seeing how the malady works, and in these visits of inspection, the infectious virus may be transmitted by adherence to their boots. During cholera epidemics, no quarantine regulations can be too rigid.

Stock buyers especially should be forbidden access to the hog quarters. The enforcement of such measures will greatly diminish the danger through human agencies. It is also possible for dogs and other animals, crows and other flesh eating birds to function as disseminators of the disease. Frequently the disease is spread from farm to farm by water courses, the drainage from an infected herd polluting the water for no inconsiderable distance. If greater precautions were taken in regard to a pure water supply for the stock, especially if hog cholera is in the vicinity, one element of contagion would be materially lessened. As surface waters are liable to be polluted from a variety of sources, the use of water from deep wells would shut out contagion from the water supply. The disease is frequently introduced by the purchase of animals from infected herds, or by animals being brought in contact with contaminated quarters in transit. Railroad cars, stock yards, etc., are often infected, and thus animals may be exposed to the germ sufficiently long to acquire the disease. The exhibition of swine at fairs affords an excellent opportunity for direct transmission of the infectious organisms.

A few years ago the statistics collected in Indiana, showed that one-third of the loss of that year in the state could be traced to infection derived at fairs, by the purchase and in changing of animals for breeding purpores. These sources of contagion could be easily prevented. It seems strange that no greater headway has been made against the restriction of the disease, when we recognize the fact that the causal organism has been known for a decade and has been carefully studied.

If the farming interests would thoroughly acquaint themselves with the various ways by which these unseen foes gain an entrance to their herds, they might be able to frequently check the spread of these diseases. But indifference and carelessness voice themselves with "sufficient unto the day is the evil thereof", ever blind to the old adage that "an ounce of prevention is worth a pound of cure".

TREATMENT.

Very little success has yet been made in the treatment of these diseases, except in the milder and more chronic cases, where laxatives are of material value. Their character is such, and their course so rapid that drugs and medicines in the ordinary sense are of little avail. It is perhaps on this account that so many reputed "cures" for cholera are foisted upon the public. Every season brings out a new crop quite as regularly as sure cures for consumption. While as yet no satisfactory treatment has been devised that will meet all the varying conditions of the disease, there is a strong hope that scientific experiments, now being made on an entirely new line, may be successful. This new method of treatment is what is known as the serum treatment, and consists in inoculating the animal with an anti-toxic serum that enables them to resist the poisonous effect of the disease in a manner similar to that of human diphtheria.

The preliminary tests made during the past season show that a large per centage of animals were saved by this treatment. The serum is now being made by the United

FACTS ABOUT HEALTH

It is Easy to Keep Well if We Know How—Some of the Conditions Necessary to Perfect Health.

The importance of maintaining good health is easily understood, and it is really a simple matter if we take a correct view of the conditions required. In perfect health the stomach promptly digests food. The blood is employed to carry nourishment to the organs, nerves, muscles and tissues which need it. The first great essential for good health, therefore, is pure, rich blood. No medicine has such a record of cures as Hood's Sarsaparilla and it is because it is the one true blood purifier. Hundreds of people are alive and well today who would have been in their graves had they not taken Hood's Sarsaparilla. It is depended upon as a family medicine by thousands.

Hood's Pills are the only pills to take with Hood's Sarsaparilla.

THOMPSON'S

GRASS SEEDER

Still leads all others. Sows all **Clovers, Alfalfa, Timothy, Red Top,** all kinds of **Grass Seeds, Flax, etc.** Special hopper for **Oats, Wheat, Barley and Rye.** Sows 20 to 40 acres per day. Hopper being close to the ground the wind can not blow the seed away. Write for free catalogue and testimonials.

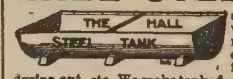
FARMERS, WHAT DO YOU SAY?

WILL THE WORLD GO HUNGRY?

This was the question asked by the Chicago Tribune of a recent date, when referring to a speech made by Sir William Crokes dwelling upon the problem of the world's wheat supply, Great Britain being able to produce only a small percentage of what she consumed.

REPLY:



WESTERN CANADA WILL PREVENT IT.

With millions of acres of excellent wheat lands in Western Canada awaiting the husbandman's efforts there is no fear of an exhausted supply. These lands owned by the Government are given free to settlers; near railways, schools, churches, &c. Particulars can be had on application to Supt. Immigration, Ottawa, Canada, or to

States Department of Agriculture, in larger quantities for further testing. This cure differs from all others in the fact that it follows the method by which nature heals the body from the effect of disease.

Animals are first rendered artificially immune, i. e., susceptible animals are made resistant by the introduction of the products of the organism causing the disease, then the blood serum of these animals so protected is used for treatment in the affected herd. If future investigations should demonstrate the permanent value of this method, much of the loss, amounting annually to from $15,000,000 to $25,000,000, which the United States now sustains, might be avoided.

Various North Carolina Queries.

ED. HOARD'S DAYIRMAN:—I enclose $1—please send me the DAIRYMAN one year. I expect soon to engage in the dairy business, on a small scale, and cannot afford to commence without your valuable paper to guide me.

The questions that will follow are doubtless very old to you, but they are new as well as valuable to a beginner, and I will not commence dairying until I see them answered in your columns:

1. Pea vines, cotton seed hulls, cotton seed meal, wheat bran, corn meal and oats are available; what will be a balanced ration for cows that will weigh 800 to 1000 pounds?

2. I expect to try to test some of the cows; how soon after calving should I commence a test for best results? Should a cow have any especial preparation before feeding for a test?

3. At what temperature should the cream be kept, and how soon should I churn after running the cream through a separator?

4. How may I know when the cream is in proper condition to churn for best results?

5. If it does not ripen as it should, what shall I use to accomplish the desired results?

6 I have a fine Jersey bull, 19 months old—how many cows can he serve each week without injury to himself, at his present age, and in what ratio can the service be increased as he grows older?

7. How and with what should he be fed to secure best development as a dairy sire?

8. Should he be allowed to run with cows or be kept alone?

Your early attention will greatly oblige a beginner. J. L. H.

Scotland Neck, N. C.

It can hardly be expected that all these questions can be answered in one issue of a paper. In fact, if all the available space for reading matter should be given up to these queries, it would require several issues to cover the ground even passably well.

1. For a regular ration, try 15 pounds pea vines, 4 pounds bran, 2 pounds corn meal and 2 pounds cotton seed meal, and what hulls, in addition, the appetite of any cow may demand.

2. No special preparation is required. A cow is usually at her best in the second month after freshening. Increase feed gradually after the calf is 5 days old, being very careful not to give more than the cow will eat with good relish. As soon as she stops eating, remove all feed left in the manger. Keep grain in above proportions, but when on high feed, include 2 to 4 pounds oats. Give a large teaspoonful of salt with each feed.

3. Keep cream at as low a temperature as possible, unless you can churn every day. Perfectly sweet cream may be sufficiently ripened in 18 to 24 hours if kept at about 70 degrees.

4 Cream when properly ripened, has a peculiar, even, silky gloss. When a paddle is dipped into it and taken out, the cream runs off smooth and not in streaks. An educated smell and taste are aids.

5. Some buttermilk saved from the previous churning, if the butter had the desired flavor. It would be a most excellent investment to get Prof. Wing's book, Milk and Its Products, or Gurler's American Dairying.

6. Three to five, and later on increasing to double that number.

7. Pea vine hay, good pasture and but little grain, and that, bran or oats or both, exclusively—but not so much as to cause him to become fat.

8. Should not run with cows. Have a ring in nose and never lead without a staff attached to ring. Never attempt to drive, or get him into a corner, or otherwise put it in his power to know that he can have his own way.

Dairying on the Farm.

Ripening Cream-Engine and Separator.—Oleomargarine.

ED. HOARD'S DAIRYMAN:—I see inquiries about ripening cream. We *used* to think after we had strained our milk in a cold place, like the milk house or cellar, let it set a few days, that it was absolutely necessary to carry it into the kitchen and let it set there until the milk clabbered, when it was ready to skim. Then as we only had a small amount of cream, had to save it until we got enough to churn—perhaps a week. But thanks to good dairy papers, I began to read and study everything pertaining to "good buttermaking", "home dairying", "dairying for profit", etc., improving wherever I could. The more I read the more anxious I was to get to the top. I soon learned that to make good sweet butter we must do away with crocks, pans, etc., and get a creamer, which we did. Purchased a Stoddard creamer with five cans, (5 gallons each). We could skim all the cream off after it had been standing 24 hours, and sometimes with ice in 12 hours. Set the cream in cold water or refrigerator, and kept it sweet until we had enough to churn. Mixed it all thoroughly, ripen by warming to 75° or 80° if the weather is cold, and when it cools and clabbers, churn at 62°. Use a thermometer. Never let cream stand after it clabbers, as it will injure the sweet quick flavor. After we had used a creamer 8 years, we were still *reading* and progressing And to make the sweetest and best butter, the dairy papers claimed a separator was the machine we needed. So we purchased a U. S. separator, run it by hand power about a year, when the boys concluded we needed an engine to run the separator. So step by step we have been going on until dairying is not the drudgery it used to be, as the little Geiser engine turns the separator, churns the butter, besides so many other things it can do on a farm. It grinds sausage meat, saws all the wood we use, cuts fodder, and is just play to run it. Our boys are all engineers. We use a barrel churn, butter worker (turns with a crank). A pound printer with our initials, F. J. P. on, stamps every pound nicely. Then we wrap each pound in parchment paper and ship.

We used to get 25 cts. per pound the year around, but cannot do it now, not on account of the butter being of poorer quality, but on account of oleomargarine flooding the market. It's made and sold here in our own city. I beg all who read this to earnestly appeal to the Senator, from their district, the importance of supporting and striving for the enactment of House Bill, number 11,604, introduced by Hon. J. H. Davidson, of Wisconsin, taxing oleomargarine 10 cents per pound, as a measure of protection to the dairyman from fraudulent competition. If we do not ask for protection from Congress, we will soon be run out by oleomargarine, as we cannot afford to produce a pure, sweet butter at oleomargarine prices.

Sisters in the cause, shoulder arms, and if you are not taking HOARD'S DAIRYMAN, Ohio Farmer, and other good dairy reading, enlist at once, and let us produce good, better, best butter on the market, and fight the butterine company with the best butter made, while our husbands implore Congress to protect us by passing Mr. Davidson's bill.

Mr. Editor, I did not intend writing such a lengthy article, and you are at liberty to stop with it wherever you wish, providing you don't stop before you get to the Davidson bill. But when I get started on this subject, it is hard to find a stopping place.

There is one thing more I want to tell you: last but not least, we keep eleven fine Jersey cows, well stabled and cared for.

St. Paul, O. (MRS) F. J. PETERS.

It Hangs On

If it was only health, we might let it cling.

But it is a cough. One cold no sooner passes off before another comes. But it's the same old cough all the time.

And it's the same old story, too. There is first the cold, then the cough, then pneumonia or consumption with the long sickness, and life trembling in the balance.

Ayer's Cherry Pectoral

loosens the grasp of your cough. The congestion of the throat and lungs is removed; all inflammation is subdued; the parts are put perfectly at rest and the cough drops away. It has no diseased tissues on which to hang.

Dr. Ayer's Cherry Pectoral Plaster

draws out inflammation of the lungs.

Advice Free.

Peas and Oats.

ED. HOARD'S DAIRYMAN:—I have become interested in your doctrine of raising protein for the dairy on the farm by the use of peas with oats, and would like to catechise you a little. You advise, I understand, 2 bushels of peas and 1½ bushels of oats per acre, the peas plowed in 4 inches deep, and the oats sowed one week after.

This replowing the land in the spring in addition to fitting it, is an item of considerable expense for a large dairy. Would it not do to fit the land with seeder, put the mixed grain in the ground 2½ to 3 in.? If not why?

Will the oats as above hold the peas upright, or will the crop lodge, if we have heavy winds? If the peas are needed for grain, can they be harvested with reaper and binder? If not, how is the crop to be secured?

Gov. Hoard recommends White Schoenen oats which are unknown here—White Russian being the popular oat. What variety of Canada peas is advised by you as most suitable? Henderson advises Large Marrowfat Canada peas. How many bushels per acre of peas and oats, sown as above, on heavy, rich bottom land, can be expected as a yield? Any information along this line you can give will be a source of instruction and profit to many interested dairymen in this section.

Gouverneur, N. Y. F. M. B

Peas that are not covered about 4 inches deep are quite apt to suffer from the dry weather. Hence they should be plowed under as suggested. Oats covered as deeply would be very likely not to grow, or, if they did, lacking the necessary warmth about the young roots, they would not do well. What is worth doing at all is worth doing well. The White Schoenen oats are recommended because they grow a strong, stiff straw. Possibly the White Russian would serve much the same purpose. As a rule, the oats hold the peas up fairly well, but sometimes they will go down, and then we cut them with a "mower" as we would lodged clover.

This crop is not raised primarily for the grain, but more particularly for hay and forage. When allowed to ripen, the yield of grain should be from 30 to 40 bushels per acre.

The Canada small field pea is preferred in this section, and elsewhere, so far as we know.

Cow Peas and Kafir Corn.

Pennsylvania Experience.

ED. HOARD'S DAIRYMAN:—I noticed on page 1013 of the DAIRYMAN (Jan. 27th) C. A. H., of Lebanon Co., Pa., inquires about "cow peas and oats," and in reply the writer thinks Pennsylvania is too far north for the cow pea. This surely is a misapprehension, as I must testify from experience and observation that cow peas are a Godsend for any Pennsylvania farmer who has soil that needs renovation, or who wants to make summer dairying pay. We cannot grow cow peas on every soil, as they will not thrive on very heavy, clayey, wet, cold, undrained soils, but only a small per cent is of that nature, as most of our soil is light, sandy, shaly, slaty or loamy. The cow pea, like the corn, is a warm climate plant, and must not be planted until all danger of frost is past. If we want the cow pea as a soil improver, where the soil is thin, worn out or neglected, we prepare very carefully a quite shallow seed bed, say three or four inches, so as not to turn up too much of the uncongenial subsoil. We use about 200 lbs. of dissolved S. C. rock to furnish phosphoric acid, and possibly a little potash. We need not apply any nitrogen, as the cow pea can take free nitrogen from the air, the same as the clover. Some varieties are heartier in the north, and make their growth in a much shorter season, and if we wish to ripen the seed, we had better sow the quick growing kinds; but if we dont care for seeds, but just wish a large mass of vegetable matter to plow under for forage, we use the long season grower, as that grows much the largest vines and roots and hence is preferable.

The roots will penetrate the subsoil, and when those decay, the soil will be in a better condition to absorb water or nourish roots of other plants that are more delicate growers. The mass of vines turned under will fill the surface soil with humus, thus putting it in a condition to hold moisture and warmth, the first two essentials of a good soil. I sowed cow peas on soil that was so poor from neglect and hard cropping that it would yield absolutely nothing, and was abandoned. By the application of a small quantity of mineral plant food, to start the peas, I started the soil on a course of usefulness, so it produces good normal crops annually, almost equal to the rich limestone valley land.

As a forage crop nothing else will take its place. The Canada field peas are very good for an early crop but being a native of a cool moist climate, they will not grow in our midsummer hot and dry weather, but will scorch and dry up rapidly. The cow peas have just the opposite nature, and will grow best in the hottest weather, and withstand the drought remarkably well.

Let me assure C. A. H. that there is nothing more pleasant for the humane dairyman, than to go out daily and cut a lot of splendid green feed for his cows, when all else, soiling crops, and pastures are dry, hard, woody, seared and brown. The cows will show their appreciation also by their contented looks and their filling the pail liberally. I generally sow with the cow peas 8 or 10 pounds of kafir corn to the acre. Oats or any other grain, except sorghum, will be smothered and disappear, but the kafir corn will force its way up through the mass of plants and tend to litt the vines up, thus letting the sun shine down through the heavy mass of foliage and thus make a better feed. At the same time, it is much easier to cut when well up from the ground. If not needed for green forage, I put them in the silo, or dry it and it makes excellent hay, if properly cured. Both horses and cows like it and do well on it.

If the pea or bean, as it is a bean in fact, is allowed to ripen, the grain makes an excellent feed for poultry and hogs, and if ground is very good for cattle.

Taking off a soiling crop of cow peas puts the land in a splendid condition to seed down with winter grain, and unless you apply some mineral plant food, you may be surprised to see your wheat lodge as far as the cow pea patch extends, because of the large quantity of nitrogen stored in the soil by the roots. Sometimes we can use the cow peas very profitably as a catch crop. For example, as soon as the strawberries are picked I plow down the vines and seed to cow peas, and in a short time I have a mass of plants cover the soil, thus we can not only conserve fertility, but add to our soil with almost no expense.

The seed can be purchased from any reliable seedsman. Price varies from $1.25 to $1.75 per bushel; some new varieties are of course higher in price as are all novelties.

Adams Co., Pa. L. W. LIGHTY.

Buff Jersey on Feeds.

(Extracts from paper read by BUFF JERSEY at the Missouri Dairymen's meeting, held at Brookfield, on Jan. 17, 18 and 19, 1899.)

With the present high prices ruling for the grains grown on the farm, it stands the dairyman in hand to study the situation, and lower cost of production, if possible. In order to do this, he must seek some feed or feeds at a lower cost than his own grown feeds; and with a knowledge of the nutritive content of some of the feeds offered by our cereal product factories, he can get a bill of fare for his cows that is very palatable and, at the same time, better adapted to the wants of his cows, than his farm grown grains, and at a lower cost. Let us compare some of the by-products with the standard feed on the farm, corn meal. With the present price of corn, a ton of corn meal costs the feeder $18, and contains 156 pounds of protein.

One ton of oat dust as feed, from the oat meal mill costs $6, and contains 178 pounds of protein, is nearly a rich in carbohydrates and 1% richer in fat than whole oats, and like oats, will give better results than our chemists show by analysis.

Dried brewer's grains are a very valuable

feed in the dairy barn; the cost is $11 per ton, and the protein content is 314 pounds, or 158 pounds more than corn meal, at a cost of $7 less than the meal, per ton.

In gluten feed we have a protein content usually of 500 pounds per ton, or 344 pounds more than in corn meal, at a cost of $5 less per ton.

Germ meal is practically the same as corn meal, and the price is from $5 to $6 less than the meal.

In cotton seed meal we have not only 740 pounds of protein, but we also have a property that is very valuable to the dairyman. During warm months when butter is so hard to handle, it has the property of raising the melting point 5 or more degrees, enabling the dairyman to put his butter on the market in better shape, and the merchant has less trouble in keeping it in an attractive condition.

With a knowledge of his business, the dairyman can, at all times, take advantage of his surroundings, and not only lower the cost of production, but at the same time increase the product of his cows by knowing just what to do and when to do it.

BUFF JERSEY.

A Canada Cheese Factory Report.

Dual-Purpose Cows at a Discount.—Various Inquiries.

ED. HOARD'S DAIRYMAN:—I inclose my renewal, and three new subscribers. I am in the center of an old dairy section. It is quite evident that the farmers here don't know how to do anything but keep cows (and a lot of us not more than half how to do that).

Leeds county is the banner county of Canada for cheese, and our township the banner township of the county. Our township is 10 miles square, and we have nine cheese factories. I will give you a report of our factory from May 1st to Nov. 12th, 1898, at which time the butter factory starts and continues until the cheese factory opens in the spring.

Total pounds milk	1,551,779
Total pounds cheese	143,396
Total cash	$11,546.48
Manufacturing	$1,612 30
Net cash	$9,934.18
Average per ton	$12.80
Lbs. milk for one lb. cheese	10.82
Average price for cheese	8.05 c.

I think the average for the nine factories would be a little larger than our factory.

I have watched with interest the discussions on the dual-purpose cows. I think they are as scarce as Clydesdale trotting horses. I think we have the right kind of cows here, but what we want pounded into us is *care* and *feed*. We hear no one talking dual purpose here. A Short-horn would be as great a curiosity here as an elephant or a giraffe.

I would like to ask some of your correspondents for plans of the best cow stalls for comfort and cleanliness.

The bacon hog is receiving considerable attention here now. As John Bull appears to have a tooth for Canada bacon as well as cheese, why not have at the top of one page in the DAIRYMAN in big letters H O G, and invite some of your big guns to tell us how to make bacon hogs. I could ask a lot of questions, and could give my successes and failures. Z. L. C.

Chantry, Ont.

Is Sure Abortion is Contagious.

ED. HOARD'S DAIRYMAN:—I notice in DAIRYMAN for January 13th, an inquiry and your answer in regard to abortion. We are having it here. P. P. Squires and myself have lost nearly every calf for over two years. We know it does not come from the bulls, for a number of bulls have been used and the calves from all suffered the same fate. Mr. Squires keeps from 25 to 40 cows and heifers, and the loss to him has been very severe as he is only getting about one-fourth as much milk as they did before abortion got into their dairy. Twenty cows have failed to breed and have been sold for beef. You say you doubt its being contagious. If you were here you would not doubt any longer. It is one of the most contagious diseases I ever saw. From my experience I am satisfied that an aborting cow in the stable will expose every cow in the barn long before she has dropped her calf. The man from whom I bought the Jersey heifer that brought abortion into my dairy, had never had a case of abortion until they came in contact with the heifer referred to above, and she did not abort until after she had been in my dairy two months, yet his cows began to abort about the same time mine did. G. A. W.

Glenwood, Pa.

Facts like the foregoing are pretty stubborn things, and when compared with our own experience, and of others with whom we are well acquainted, seem to prove beyond successful contradiction, that there is at least more than one species of this malady.

DAIRY MARKETS.

ELGIN, Ill., Feb. 13.—Butter—Offerings 50 tubs. Sales 41 tubs at 23c, 9 withdrawn on that offer. Official market active at 22c.

CHICAGO, Ill., Feb. 13—Butter—Creamery, extra, 21½@22c; firsts, creamery, 19@20c; seconds, 14@15c; dairies, selected, 18c; No. 1, 15@16c; No. 2, 13c; extra ladles, 14c.

Eggs—At mark, cases included, 22@23c; seconds, $2.50@3 per case; frozen, 10c per dozen.

Cheese—Full cream, Twins, good to choice, 10@10¼c; Cheddars, 9¾@10¼c; Young Americas, 11c; Swiss, 10@12c; Limburger, 8@10¼c; Bricks, 8½@10½c.

Cattle—A good demand prevailed and prices ruled strong to 10c higher; the best beef cattle, and desirable cows and heifers showing the most strength Receipts were comparatively small and the quality poorer than usual. One load of 1,459-lb steers sold at $6.10, with $5.90 the next highest for 1,393 lbs. average. Steers averaging 858@1,600 lbs sold at $4 15@5 80, bulk, $4 70@5 50; corn fed Westerns sold at $4.40@5.65; Missouri Texas, $4@5 10; distillery fed steers, 1,079 lbs. $5.10 Two loads of fancy 1,331-lb. Western heifers sold at $5.15. Native butcher stock sold at $2@4 60; calves, $4@7 and feeding cattle at $3.50@4.70.

MILWAUKEE, Feb. 13.—Butter—Creamery, extras, per lb., 20c; firsts 18@19c; seconds, 16@17c; imitations, 15@17c; fresh dairy good to choice selections 15@17c.

Cheese—Full cream Twins, per lb, new, 10½@11c; Brick 10@10½c; Limburger, 9½@10c; Swiss 11@12c.

Eggs—Fresh, per doz., 22@23c. Market higher and unsettled; very scarce; wanted.

CINCINNATI, O., Feb. 13.—Butter—Firm.

Eggs Strong; higher; 22c.

Cheese—Firm; good to prime Ohio Flats, 11@11½c.

BALTIMORE, Md., Feb. 13—Cheese—Steady; fancy New York large, 11@11¼c; medium, 11¼@11½c; small, 11½@11¾c.

Butter—Steady; fancy creamery, 21@22c; ladle, 15c; good ladle, 13@14c; store packed, 11@12; rolls, 12@13c.

Eggs—Firm; fresh, 20@21c per doz.

KANSAS CITY, Mo., Feb. 13.—Butter—About steady; creamery, 16@20c; dairy, 15c.

Eggs Supply barely equal to the demand, which is fair; fresh candled Missouri and Kansas stock, 21c; 21c in new whitewood cases, cases included.

BALTIMORE MARKET.

BALTIMORE, Feb. 9—Butter—The power that moves the prices of butter up and down must be the jackass power mentioned by Benj. F. Butler during one of his speeches in Congress, for the rising and falling generally are against rhyme and reason, and the butter interests. Can it be that the stock yards dictate the course of prices to the butter men? The market was quiet, transactions slow and small, when, to accelerate movements, so it was presumed, prices were lowered; still foreign trade was not attracted to the fresh creameries, so prices have suddenly been moved up nearly to the limit. It is obvious that one, or both, of these movements was wrong; foreign competitors are not so erratic;—prices are steadier in Canada, Holland and Australia than in the United States, and the trade we want to interest in our creamery products would prefer dealing in markets less mercurial than the markets of this country. Receipts of fresh goods have been light and the demand has about kept pace with them. Junes are having some attention. Rolls in light receipt and good demand. Regular business in blocks and prints—no accumulations.

Creamery Separator, extras, 21@21½c; firsts, 19@20c, seconds, 17@18c; Creamery Ohio Separator, extras; 19@20c, firsts, 18c; seconds, 15@16c; Creamery Gathered Cream, extras, 17@18c, firsts, 16@16½c, seconds, 15@15½c; Roll, extras, 13c, firsts, 12c, seconds 11c; W. Va. Roll, firsts, 12c, seconds, 11c; Western Storepacked, firsts, 11c, seconds, 10c; Creamery Blocks, (2 lb), extras, 22@23c, firsts, 20@21c, seconds, 18@19c; Creamery Prints, (½ lb) extras, 22@23c, firsts, 20@21c, seconds, 18@19c; Md. Va & Prints 18@19c; firsts, 16@17c, seconds, 14@15c.

Eggs—So far this week the receipts have been rather light, and had it not been for the very liberal supply left over from last week, the receipts of this week would have been inadaquate to the demand. We write the market in good shape, and the general tone is firmer, and an advance is looked for in the near future. Duck eggs are in light receipt; there is a good demand for all choice stock at 19½ 20c: small and dirty eggs are excepted.

Cheese—Our cheese market is in good shape and firm with moderate offerings, and a good demand for desirable grades. N. Y. State—Cheddars, fine, 11@11¼c, choice, 10¼@10½c, fair, 7@8c; Flats, fine, 11¼@11½c, choice, 10½@10¾c, fair, 7½@8¼c; Small, fine, 11⅝@11¾c, choice, 10¾@11c, fair, 8½@9c. Ohio—Flats, fine, 10@10½c, choice, 9@9½c, fair, 8@8¼c; Ohio Picnic, fine, 10⅛@10¾c, choice, 9⅛@10c, fair, 8⅛@8¾c; Swiss Cheese, fine, 11@12c, choice, 9@10c, fair 8@8½. G. M. LAMB & BROS.

301 Exchange Place.

FOREIGN MARKETS.

BOSTON, Feb. 11—Cable advices of this date, from the principal markets of Great Britain to Geo. A. Cochrane give butter markets as quiet Arrivals of Australian, American and Canadian are large, which causes accumulations, with buyers pressing their advantage with more or less success. The weather has again turned mild, which causes holders to be anxious, who are forced to make concessions, to move their receipts at all freely. Finest Danish 22½@23½c; finest Australial, 21@22c, with very good quality to be obtained at 18½@19½c. Finest Canadians in boxes are selling about the same as finest Australian. American creameries in tubs have arrived more freely, the very finest of which has sold at 19½@20c, with grades under finest ranging, all the way from 19c down to 16½c; the latter are difficult of sale as margarine and margarine mixtures are preferred by buyers. Some very fancy fresh imitations have sold at 16@17c; ladles have gone dead slow of late and are not selling at all freely at 15c downwards.

Cheese markets are very firm although holders cannot as yet obtain any advance in price as buyers take only for immediate wants. Finest Septembers are held at 10½@11c, with Canadians held for more money. Grades just under finest are in light supply and active request at 10c downwards.

National Champion Buttermakers

EVERY ONE AN

"ALPHA-DE LAVAL" USER.

The honor scoring record of "Alpha" disc made butter the past five years has been a marvelous one the world over, "Alpha" and "Baby" separator butter having made a practically clean sweep of all higher competitive averages and awards in every general contest—National and International, State and District—in America and all other countries.

There have now been seven Annual Conventions and Grand competitive Butter Contests of the National Buttermakers' Association,—1892, 1893, (none in 1894), 1895, 1896, 1897, 1898 and 1899. The following is the list of years, places of convention, names and addresses of sweepstakes Gold Medal winners, and the highest scores. Every other higher prize winning exhibit likewise has been "Alpha-De Laval" made:

1892,	Madison, Wis., Louis Brahe Washington, Iowa..... score,	98
1893,	Dubuque, Iowa, C. W. Smith, Colvin's Park, Ill..... "	97
1895,	Rockford, Ill., F. C. Oltrogge, Tripoli, Iowa..... "	98
1896,	Cedar Rapids, Iowa, Thos. Milton, St. Paul, Minn..... "	97.82
1897,	Owatonna, Minn., H. N. Miller, Randall, Iowa..... "	98.5
1898,	Topeka, Kas., Sam'l Haugdahl, New Sweden, Minn..... "	98
1899,	Sioux Falls, S. D., A. W. McCall, Creston, Iowa..... "	97

Every experienced separator buttermaker understands that while the separator does not of course make the butter, that the "Alpha" disc separation process does contribute largely to the superior excellence of the butter produced with its help—in the lower temperature at which a thorough separation can be accomplished than is approachable by any other separator; in the more complete removal of dirt, fibrous and casein matters than is possible with any other separator, and in the "smoother" and more even'y churnable quality of cream than can be produced with any other machine, due to the much lower relative speed and diameter of bowl and the perfectly proportioned adjustment of inlets and outlets which the "Alpha" disc principle alone makes possible

These advantages have a bearing upon the grain, texture, solidity, flavor, and keeping qualities of the butter, which in combination with equal conditions of milk and equal care and skill upon the part of the buttermaker invariable give to "Alpha" disc made butter its manifest superior excellence.

The De Laval catalogues touch upon these subjects in greater detail and may be had for the asking.

The De Laval Separator Company,

WESTERN OFFICES: Randolph & Canal Sts., CHICAGO.

GENERAL OFFICES: 74 Cortlandt Street, NEW YORK.

BRANCH OFFICES: 1102 Arch Street, PHILADELPHIA.

READING NOTICES.

All Reading Notices under this head are at the rate of 25 cents per line.

Wanted—Position in dairy as forman, by neat, industrious man. Can make butter, very successful in the care of cattle, an expert in the care and handling of hogs. Can handle any kind of separator. Can give No. 1 references. Will guarantee satisfaction. Address "F," care Hoard's Dairyman. 1-tf

Wanted—Immediately or by April 1st, position as manager of retail milk route by young, single man, who has proven his ability as a salesman by having had years experience where competition is very strong. Thoroughly understands the use of all modern facilities for handling milk; also the care and feeding of dairy stock. References exchanged. Address DILLIGENT, care of HOARD'S DAIRYMAN.

Wanted—Position as dairyman by single man, (Swedish descent) in plain dairy. First-class butter maker. J. C., Hoard's Dairyman.

Wanted—Married man for farm. Good milker. Must understand care of stock and have experience in all lines farm work. Permanent position. State wages. References. F. H. EAMES, Springfield, Wis.

A Complete creamery outfit for sale cheap that has been used but very little. Address HABIGHORST BROS., Sheboygan Falls, Wis. 1tf

For Sale or Rent—The Highland creamery with a first-class outfit. For particulars address GEORGE REKLAN, Sec'y, Theresa, Wis.

Iowa Farms For Sale—$2 per acre cash, balance ½ crop until paid. J. MULHALL, Sioux City, Ia. 1-3

For Sale—A suburban home and farm of 600 acres, fine soil well watered. Very hea thy climate. Home fronts Georgia R. R., two story dwelling, barns, orchard. Price $7,000, Apply to Dr. J. S. WILSON, Greensboro, Georgia.

Wanted—A man with two sons competent to manage farm and dairy. J. W. CRON, Bloomington, Ind.

If you want to receive any one dollar book or a year's subscription to any one dollar magazine for 25 cents, address ELTON G. RICE & CO., Berwyn, Ill.

Wanted—Position by competent buttermaker. Managed milk pasturizing plant one year. Address H. C. GROELER, Watertown, Wis.

Wanted—A position in a Separator Creamery. Eight years experience in butter making and running all kinds creamery and ice-making machinery. Good references. Address BOX 492. Sharon, Wis.

Wanted—Position by reliable, first-class butter or cheese maker; four years' experience; high-grade goods; best of references, wages reasonable. J. H. WINES, Ames, Iowa. 1-2

Wanted—A position by a Cheddar and skim cheese maker. Have had three years experience. Best of references. BENJAMIN EWART, South Richland, N. Y.

Wanted—At Meramec Highlands Dairy—near here, experienced and expert dairy milkers. Married men preferred. Wages $30.00 and free rent. Also one such for foreman, wages $35 00 whose family will board the dairymen Address or reply, MERAMEC HIGHLANDS CO., 4th and Washington Ave., St. Louis, Mo. 52-2

An Entire Carload—Of high graded Jersey cows and heifers are in my hands for sale immediatley. F. H. MERRELL, Portage, Wis. 52-tf

For Sale—A very desirable and good paying dairy, consisting of 20 head, or more of Holstein graded cows; average milk sales of two hundred dollars per month. C. H. ELLIS, Waxahachie, Texas. 52-tf

Wanted—A single man to work on dairy farm. must be a good milker, steady and of good habits. State wages wanted and give references W. H. RUSSELL, Luana, Iowa. 52-2

Wanted—Creamery for house and lot in Chicago, Ill. Address R. J., Hoard's Dairyman, 52-2

For Sale—One first-class creamery and skimming station. DOWNING MFG. CO., Downing, Wis. 35-tf

Hermanville Tamworths, Yorkshires, etc. J. A. MACDONALD, Hermanville Farm, P.E.I., Can. 32-52

For Sale—Fifteen h. p. tubular boiler and 10 h. p. (10x7 cylinder) upright engine, latest pattern, veriable cut-off. As good as new. Also 7 h. p. oscilating engine. Will sell cheap. GEO. WOODRUFF, Administrator Janesville, Wis. 50-4

Situation—is wanted by a first-class and experienced butter and cheese maker. Can make Swiss or American cheese. Guarantee good work. GODFRIED KELLERHALS, Kenton, Ohio. 50-4

For Sale or Rent—A dairy farm of 220 acres 30 high bred Jersey cows, 13 yearling heifers, a good dairy building with a No. 3 U. S. separator, tread power, all necessary appliances, with the trade of private customers, consisting of 50 private families; every thing complete for a live, up-to-date dairyman. Will sell the stock and dairy appliances and rent the farm for a term of years, or sell the entire outfit. The last four years the cows have averaged 300 pounds of butter. 160 acres plow land, 3 barns, including a cow barn 30x54, a horse barn 24x36, a hay barn 24x30, 100 feet of shed room, attached. 3 miles directly west of Cherokee; good roads to town. D. LAYTON, Cherokee, Iowa. 50-4

Position Wanted—As butter-maker in good separator creamery by reliable and temperate man. Good references as to ability and habits. State wages. Address J., Box 64, Portland, Ia. 50-4

BUTTER FAT AND CHEESE.

On page 952 of the last volume was printed the following question and answer.

Which would make the most cheese, "a cow testing 6 per cent and giving 6 quarts of milk, or a cow testing 3 per cent and giving 12 quarts of milk." Again, it is reported here that (by fat test) the 6 per cent test draws as much again money per hundred pounds of milk as a 3 per cent test. Is that true? If so, how do you "reconcile" the fact that 100 pounds of 6 per cent milk will place as much cheese on the market as 200 pounds of 3 per cent? Please answer and oblige a reader.
Birch Run, Mich. C. W. D.

According to investigations by Dr. Babcock on the yield of cheese, 100 pounds of 3 per cent milk will make 9 pounds of green cheese, while 100 pounds of 6 per cent milk will make a little over 12 pounds. At this ratio, the cow giving 12 quarts (25.8 lbs.) of 3 per cent milk would make 2.32 pounds of cheese, and the cow giving 6 quarts (12.9 lbs) of 6 per cent milk would make 1.54 pounds of cheese. In the same way, 100 pounds of 6 per cent milk will make 12 pounds, and 200 pounds of 3 per cent milk 18 pounds of cheese.

But something more than the weight of cheese made enters into the question of the value of milk. Experiment has shown that a milk containing 4 per cent of fat will make the best quality of cheese, and one that will bring the highest price on the open market.

Consequently, as a large per cent of the milk brought to the factories is below 4 per cent fat, the 5 and 6 per cent milk is well worth the extra price paid for it, to bring the poorer milk up to the necessary standard of 4 per cent.

A correspondent comments on this as follows and asks for a more extended discussion.

ED. HOARD'S DAIRYMAN:—Your idea of bringing up poor milk would do, providing that idea would hold together. However, when we come to take into consideration the whey tank and the difference in the amount of fat rising on top thereof when the six per cent cream goes in, and the amount of fat on top when it doesn't go in, it makes one smile. But let that be as you quote it, in the above article of Jan. 6th, and then there is an obstacle in our way to see, and that is, that all cheese sells on the market at the same price, and by law to-day a three per cent fat cheese is a full cream cheese. However, Mr. Editor, the dollars come back from the sales of both grades of cheese exactly the same. If both grades were made separate, and sold on their merits, then the advantage would be in favor of the three per cent milk, as it would make more pounds of cheese than the six per cent milk, in proportion to the present test system of paying on the basis of one-half difference between three per cent milk and six per cent milk, and in my mind there is a difference between the two grades of milk. But after taking into consideration all those truthful points, with me, and according to your own estimates in last week's article, the difference between six per cent milk and three per cent milk would compare nearer to one-fourth difference than one-half difference, as a basis to pay upon, after considering the way both grades are handled. Both placed in the vat together, made into cheese, and then sold on the market as one cheese, and the dividend received therefrom paid over to the patrons as one grade of cheese, there can't be any more difference between the two grades than the amount of cheese the difference thereof will make, as per your own figures in last week's issue, is nearer one-fourth than one-half difference between a six per cent milk and a three per cent milk.

Now then, Mr. Editor, I hope you will reprint this article of Jan. 6th and my query herein attached, together with a good, clear and truthful reply, as this point which I raise here is very frequently agitated among the patrons of our factory, and I dare say of many more throughout the country, and I do believe if you give it a fair and clear decision, it will help to harmonize the feelings of the patrons thereof, as to that one fact in their minds.

Saginaw Co, Mich. CHAS. P. DOUGLASS.

If the DAIRYMAN should give only an opinion on the subject, our correspondent would probably reply with a corresponding opinion and we might go on indefinitely without coming to any positive agreement.

Instead, therefore, of an opinion, we will give facts and figures which have been obtained in regular factory work and let them speak for themselves. But before doing so we will give not an opinion but a statement which is the result of a long series of careful work in factories in which the milk from 15,000 cows has been handled. The work was done under the careful supervision of Prof. VanSlyke, probably the best authority on Cheddar cheese making in the country.

The statement is as follows: "The facts all go to show that it is really more economical, so far as the loss of fat is concerned, to make cheese from normal milk rich in fat than from normal milk poor in fat. The loss of fat in cheese making is quite independent of the amount of fat in the milk.

The variations that occur in loss of fat are due either to the condition of the milk or to some special conditions employed in the manufacture or to both. When a cheesemaker says that he cannot make cheese from milk containing over 3.5 or 4 per cent of fat without having extra large losses of fat, he brands himself as a thoroughly incompetent maker."

The fact that Ohio makers of part skims obtain their cheese grease as John Gould said not long ago, from the whey vats of eastern makers of full creams is no argument as to the relative value of fat for cheese making. It merely shows that a maker who loses such large amounts of fat should be engaged in some other line of work than cheese making; nor can we see anything to laugh at in the fact that a valuable food product is wasted by incompetent and careless workmen.

The following table shows the per cent of fat lost in the whey from milk of different richness:

Pounds of fat in 100 lbs. milk.	*Pounds of fat lost in whey for 100 lbs. milk.*	*Per cent of fat in milk lost in whey.*
3 to 3.5	0.32	9 55
3.5 to 4	0.33	8.33
4 to 4.5	0 32	7.70
4.5 to 5.0	0.28	5 90
5 to 5 25	0.31	6.00

The figures show that a good cheese maker will have no more actual loss from 5.25% milk than from 3% milk, and that the percentage loss of fat is 3.55% less on the rich milk than the poor article. Consequently the loss of fat in the whey vat cannot enter into the question of the value of the fat. The next question is relation of fat in the milk to the yield of cheese.

The following table shows some points to which we wish to call attention:

Per cent of fat in milk.	*Pounds of green cheese made from 100 pounds milk.*	*Pounds of green cheese made from one pound of fat in milk.*
3 0 to 3 5	9.14	2.73
3 5 to 4.0	10 04	2.70
4.0 to 4.5	11.34	2.73
4.5 to 5.0	12.85	2.71
5.0 to 5.25	13.62	2.66

The table shows that each pound of fat, whether in poor or rich milk, makes very close to 2.7 pounds of green cheese and that the amount of cheese increases very nearly in proportion to the increase in the richness of the milk.

The following table shows why this increase takes place.

	Pounds in 100 lbs. of milk.	*Pounds lost in whey for 100 lbs. of milk.*	*Pounds covered in cheese for 100 lbs. of milk.*	*Yield of green cheese from 100 lbs. of milk.*	*Pounds of green cheese for one lb. of fat in milk.*
Fat	3.00	0 28	2.72	....	....
Casein	2.00	0.10	1.90	....	....
Water and salt	....	....	3 63	8.25	2.75
Fat	4.00	0 30	3.70	....	...
Casein	2.67	0.10	2.57	....	....
Water and Sal	....	....	4.73	11.00	2.75
Fat	5.00	0 32	4.68	....	....
Casein	3.15	0.10	3.05	....	....
Water and Salt	....	....	5.65	13.38	2.67

I is seen that 3% milk contains 2% of casein, whereas the 5% milk contains 3 15% of casein.

In both these cases a certain amount of water and ash go to assist the casein and fat in making up the cheese and it is evident that the larger amount of fat and casein in the richer milk will also retain more water than in the case of the poorer milk. Thus where 3% milk makes use of 3.63 pounds of water, the 5% milk puts two pounds more or 5.65 pounds of water in the cheese. As a final result, therefore every additional pound of fat in the milk means approximately one pound of water and 9½ ounces of casein or 2.70 pounds of green cheese.

Now making comparison between 100 pounds of 3% and 100 pounds of 6% milk, we find that in factory work the yield of cheese was as follows: 100 pounds 3% milk made 9.25 pounds of cheese, 100 pounds 6% milk made 13.30 pounds cheese.

The market price for extra cheese this week is 11½ cents per pound, which would make the 3% milk worth 106.37 cents, and the 6% milk 152.9 cents per hundred pounds; or within 6 cents of being 50% more valuable than the poorer milk in weight of cheese made, alone.

As regards markets, of course there always will be difference of opinion on the relation of the factory to the cheese buyers. It is the old question of the producer, the middleman and the consumer. So long as the consumer cannot and the producer will not seek each other out, it is probable that the middleman will flourish at the expense of both parties. But this is no reason why the producer should sacrifice part of his profit for the accommodation of another, as he seems to do at the present time. Our correspondent says that all cheese brings the same price regardless of quality. It may, under the conditions under which he sells his product; but there is a very decided change in price, as soon as the article is put on the general market.

We would call his attention to the following prices as given in this week's DAIRYMAN:

Full cream, extras, 11½ cents per pound; medium, 10½ cents per pound; poor, 6 to 8 cents per pound.

Part skim, extras, 8½ cents per pound; medium, 7 to 7½ cents per pound; poor, 4 to 6 cents per pound.

There is a difference of 5½ cents a pound, according to the quality of full creams, and 7½ cents between a poor skim and an extra full cream. Now, how much of this 7½ cents is due to poor making, and how much to a lack of fat is an interesting question. Taking into consideration the fact recently given in the DAIRYMAN, that a manufacturer of full cream cheese in New York was selling his total output for 15 cents per pound, and was enlarging his factory to meet the demand, we are inclined to think that the difference is caused by the lack of fat more than poor making.

It certainly seems that the price of cheese is regulated by the per cent of fat more than our correspondent is inclined to believe possible.

Milk Pails and Clean Milk.

ED. HOARD'S DAIRYMAN:—In the DAIRYMAN of Jan 30th, 1899, page 996, H. S. Hopkins of Ames, Ia., recommends a milk pail for keeping milk clean, which I suppose is similar to the one used at the Kansas Agricultural College, described in the same issue by D. H. Otis, page 1006. After using my covered pail, for three months, as described and illustrated on page 882 of No.

A lamp does not burn very well, and eats its head off in chimneys, unless you use the chimney made for it.

43, of the DAIRYMAN, I can say that I like it much better than I did at first.

The Editor pointed out some objections to the pail described by Mr. Hopkins, but the main objection to it and the same or similar one, used by the Kansas Agricultural College, is that there is too large an opening in the top to milk into. True, this opening is covered by a cloth or wire strainer but the dirt that falls upon it is forced through it by the pelting of the streams of milk under the hands of a vigorous milker.

The essential point in keeping milk clean is never to let dirt (filth) get into it. The tubes in the milk cover I use are one inch and a half in diameter. These small openings are fully protected from any falling dirt by the hands of the milker. I can now milk a gentle cow in the dark using this cover. As the lower part of the palms of my hands almost encircle the tops of the tubes, I know to a certainty that the milk is going into the pail and that nothing else is going in with it.

It requires some practice to hold the pail in just the proper position between the knees, so as to avoid missing the openings but in milking a fidgety heifer, very little is wasted. As Mr. Otis truly says: "In spite of the best precautions, the top of the pail will be covered with numerous hairs and dust particles, enough to spoil the digestion of any man if he only knew what he was swallowing, when he drinks the milk out of an open pail." Then why leave a six-inch opening in the top of the cover to gather a large portion of this filth? This morning, after milking five cows into my covered pail, I drew a circle six inches in diameter, including the tubes in the circle, and I found that almost all of the dust, hair, dandruff, etc., that had fallen on the cover was inside this circle.

The cows' udders were apparently clean but the top of that cover inside of the six inch circle did not have a very appetizing look. Remember too that this cover is convex and quite a good deal of the dirt falling upon it slides off the smooth tin surface or is knocked off when the cover is removed to empty the milk three times, as was done in the milking referred to. Would not all the dirt that falls upon the strainer in the "sanitary pail" adhere to it, making necessary a change of cloths or a washing of the wire strainer at every filling of the bucket? Even then the most of this filth will be dissolved or forced by the streams of milk through the strainer.

As I suggested in my first letter describing the cover, I should prefer to have new pails made so that the flange of the cover would fit on the outside of the rim of the pail. If a wire hoop is used to fasten the strainer that goes over the top of the pail before the cover is put on, it will be found more convenient when removing the cover to empty the milk. But if the covers are made of heavy tinned plate and fit tight there is hardly any need of the strainer under the cover. Even without the strainer, if care is taken to protect the openings in the cover from dirt, when carrying the milk away to be strained, there will be no sediment when it is emptied into the strainer, and no odor but that which is natural to clean milk.

I wish that every person who owns a cow would give this matter more attention. I know of good people, unthinking people, who will feed little babies and delicate children with milk so foul that the sediment will blacken the bottom of a tea cup, while the child is eating its meal. How many thousands of children are thus poisoned we will never know, but it is surely time that more attention was paid to it. Boards of health in the cities may do much to check the evil there, but in the little towns and even in the farmer's home the slaughter of the innocent babes goes on unceasingly. Is it not worth while to "do our best" to keep the milk clean? SAMUEL GRAY.

Vermillion Co., Ill.

Watering Cows.

ED. HOARD'S DAIRYMAN:—I am going to build two silos this year of 150 tons each. I can get a good flow of milk from my cows without silage but as I believe the oil mills have formed a trust, and keep O P. oil cake meal so high ($23 on cars at mills, Piqua, Ohio,) that the farmers will have to resort to something cheaper.

I have sixty cows and deliver milk and cream in town. I also have fourteen full blood A. J. C. C. heifers, all daughters of King Cotton. They are all bred to Edgardo 50703, a bull I purchased from C. Dixon, of Gillespieville, Ohio.

I want to tell you how I water my cows in winter. You know they want warm water. I have a large tank in a shed adjoining my cow barn and one in a small lot outside. This trough holds about twelve barrels. They are filled from a spring at the dairy room and I have steam pipes from dairy boiler run in a box along side of water pipe. I used 6 in. plank for top and bottom of box and shingle lath for sides. The steam pipe will let live steam in the trough and the water will heat in running along side of it also. In fact, the steam heats up the pipes so that we find warm water running quite a while after we turn the steam off.

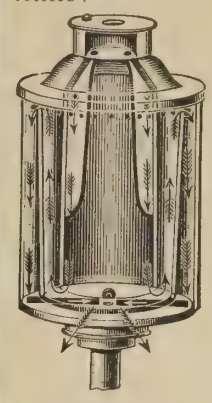
Sometimes the water did not run fast enough to suit me and I got a small injector ($5.00) and connected it to steam pipe in bottling room by a three-eighth inch pipe and to a 20 bbl. tank in loft above. Connected this tank to main pipe for conveying water to barn. The injector threw a three-fourth inch stream of warm water.

Now if the weather is warm I don't need it but when a frosty morning comes I can send nice, fresh, warm water to the trough over two hundred feet away.

I let my cows out, about fifteen at a time, at about eight o'clock in the morning. While out, the men clean out and bed down and put in a little cut hay or stover. One would be surprised to see how the cows take hold of the water when pumped this way. I can pump five hundred gallons per hour with forty pounds of steam. My cows are only let out to water and put back right away. We give them a chance to drink both morning and evening.

I think it a very easy matter for anyone having a boiler to give their cows warm water and I find it much cheaper to pump it with steam than to heat it afterward.

You will excuse me for writing so much, but as you say milk is about 87 per cent water I do not care about my Jerseys using all the feed I give them, heating up the water they drink. JACOB E. WHITE.



Highland Co., Ohio.

Save Money and Labor by Buying

THE IMPROVED U. S.

TRIPLE CURRENT SEPARATOR

Users say it is **unequalled** for **clean skimming,** durability and ease of operation. They surely ought to know. Read a few of their letters :

The More Used the Better Liked.

RIDGEWAY, WIS., Jan. 9, 1899.
The more we use the Improved U. S. Separator the better we like it. It is as **reliable as a good clock,** and it seems to me that it will be **as durable.** It runs light, does good work, is easy to take care of, and made to last.
THOS. CONVEY, Conductor of Farmer's Institutes.

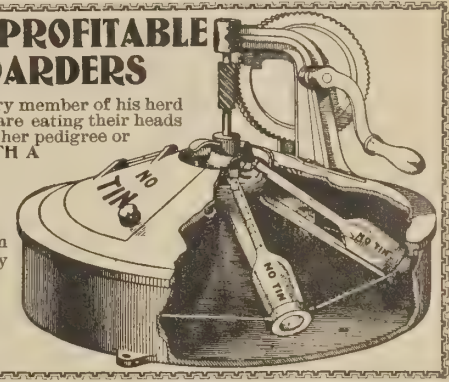
Takes Out Every Particle of Cream.

SILVINA, WASH., Jan. 2, 1899.
The No. 5 Improved U. S. Separator is all right. It is easy to turn, easy to clean, and takes out every particle of cream. We make considerable more butter and receive 2½ cents per pound more for it. It is the best machine a farmer ever bought. MAX BARTL.

Greatest Labor-Saving Machine.

TURIN, N. Y., Jan. 11, 1899.
The No. 5 Improved U. S. Separator works finely. It is the greatest labor-saving machine for making butter that was ever made. **We could not do without it.** Every farmer should have one. J. BIBBINS.

Remember that in order to have the best, the **TRIPLE CURRENT SEPARATOR,** you must buy the **IMPROVED UNITED STATES.**

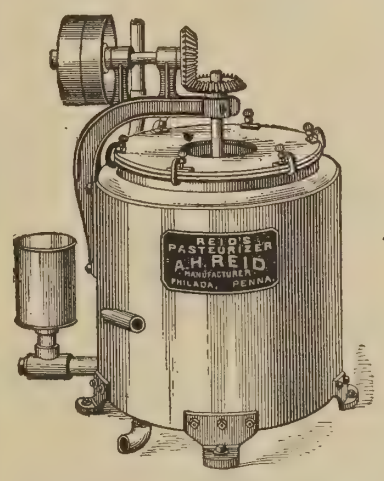


Illustrated circulars free on application.

VERMONT FARM MACHINE CO., Bellows Falls, Vt.

DON'T KEEP UNPROFITABLE BOARDERS

Unless the dairy farmer has had every member of his herd tested he unquestionably has some that are eating their heads off. He can't tell by the shape of the cow, her pedigree or the color of her milk. HE CAN TELL WITH A



NO-TIN BABCOCK TESTER.

This will solve the problem for him in an hour. He should test each cow frequently to see whether she is paying her board.

Send for Catalogue No. 85.

Investigate

Pasteurization is a question that you can't overlook or ignore. Many creameries practically and satisfactorily solved this question in 1898, many more will demonstrate the advantages and profitableness of hot skimming during 1899. Every creameryman and every buttermaker owes it to himself to study this important question in all its bearings. Begin your investigation to-day by sending for information and facts regarding Pasteurization and a full description of the

REID PASTEURIZER

When you write, ask for the book about the REID Latest Improved 1899 Separator—the best machine for hot skimming ever built.

A. H. REID, 30th and Market Sts., PHILADELPHIA, and CEDAR RAPIDS, Iowa.

The REID Latest Improved 1899 Separator.

The Dairy Form and Constitution.

ED. HOARD'S DAIRYMAN:—There is no one point in the dairy cow that has perplexed me more than to harmonize my ideas of constitution with those of my colleagues in agricultural institutions, or with the way in which the points denoting constitution have been treated in books on live stock.

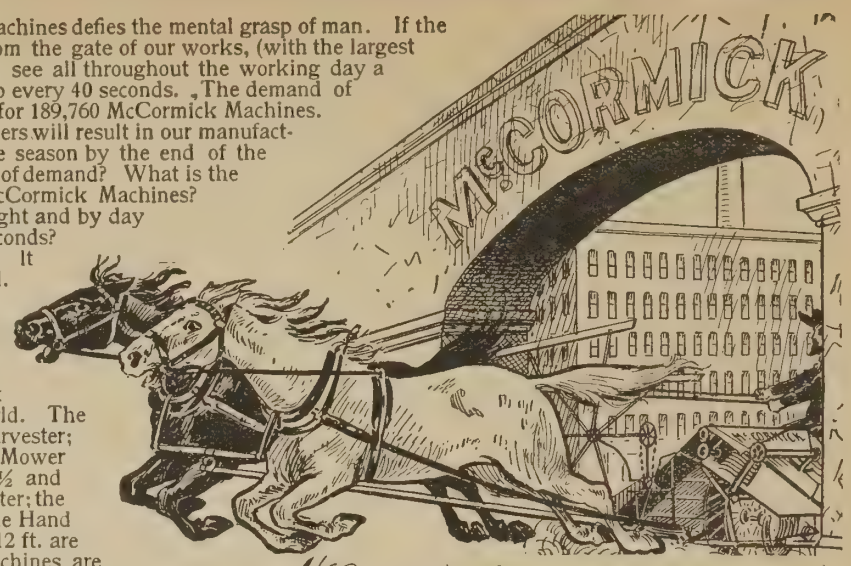
What information I have acquired on dairy stock has not been gleaned from books, but mostly from long experience in handling stock and by observation in inspecting noted herds and animals of especial note, either as dairy animals or as progenitors of famous dairy animals.

The peculiar make up or conformation of dairy cows that live to a great age and at the same time have performed an enormous amount of work, I first noticed in 1882 when I was commissioned by the University of Wisconsin to visit some of the best dairy herds in the east with a view of selecting some dairy stock for that institution.

During the ten years from 1877 to 1887 I collected and read nearly every catalogue issued by breeders of dairy stock and read all articles in the agricultural press relating to it. I knew the records that nearly every dairy cow had made during that time and prior thereto. I knew, therefore, where to go to see the best dairy cows in the country at that time. I was in quest of information and missed no opportunity to see a great cow or a great sire, and to my astonishment, none of them possessed the points that are generally cited as indications of good constituuion. The herd that gave me the most material for study was that owned by J. H. Walker, of Worcester, Mass., now chairman of the finance committee in the lower house of Congress.

His herds at that time were scattered over several farms in Massachusetts and New Hampshire. They included representatives of nearly all the famous families of those years but his specialty was descendants of the Motley importation in 1850, in which were the cows Countess, Flora, Twilight and Duchess, and the bulls Colonel and Czar 273. These were inbred for many years and produced many famous cows, the most noted being Jersey Belle of Scituate, that made 705 pounds of butter in a year on just ordinary good feed.

Many of the cows in Mr. Walker's herds were identical in breeding to Jersey Belle and some were so nearly like her in form and appearance that it was difficult to distinguish between them. Nearly all had been collected by the single standard of pedigree, and I was informed by Mr. Walker that in all the selections that were made, not a single cow proved to be simply an ordinary good dairy cow. They were as uniformly great producers as they were uniform in build and breeding.

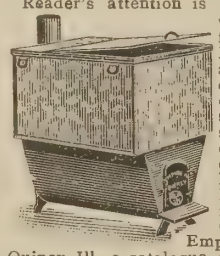


On a farm near New Hampton, New Hampshire, I remember seeing Countess of Lakeside, Rosa of Lakeside and Beauty of Lakeside, three cows some sixteen years old, almost exact duplicates of Jersey Belle, and upon inquiry was informed that they were not only by the same sire but full sisters in blood to her.

In the herd there were a great many very old cows still in their full vigor and doing excellent work in the dairy. Since then, when I have found a cow that had great dairy qualities and had the ability to do much dairy work during a long life, I have found the cow to have a large middle piece, to be spare and angular, sharp withers, light in neck and head, full and expressive eye, a clean, well developed spinal column and rump, clean and rather narrow through the fore quarter, sharp hook points, thin incurving thigh and well developed udder. The udder not always specially large, but always covered with a coat of fine hair and soft and elastic, showing that the circulation in the organ is active. We hear and read much of depth of chest and good lung and heart capacity, but we do not see that these points are specially prominent in the typical dairy cow. We hear much of the theoretical danger line, and yet the cows that actually demonstrate their ability to perform much work in the dairy for a long time, are the very ones that are so near this imaginary danger line that they would be classed as having weak constitutions were they judged by these rules.

An eminent veterinarian, in a bulletin issued some years ago, describes the kind of animal that has a tendency to tuberculosis, and in doing so describes the typical dairy cow. He cites no authority for his statement and it is fair to assume that it was simply an opinion, not backed by any statistics. The greater ability of this spare, sharp withered, ewe necked, cat hammed, pot bellied cow to ward off disease, was clearly demonstrated at the Minnesota station.

At the time when the tuberculin test was first applied to the beef and dairy herds, all but one of the former responded, and only one of the dairy cows was found diseased. Neither Dora, Pride, Bettie, Biddle, Sweet Briar, or old Marjoram ever took the disease,



The enormous output of McCormick Machines defies the mental grasp of man. If the machines we manufacture were to issue from the gate of our works, (with the largest output in the world) the spectator would see all throughout the working day a McCormick Machine emerging at full gallop every 40 seconds. The demand of the farmers in the past season of 1898 was for 189,760 McCormick Machines. This continuing tremendous call of the farmers will result in our manufacturing and selling still larger numbers in one season by the end of the century. What is the cause of this unheard of demand? What is the reason of the everlasting popularity of McCormick Machines? Why are we forced to run our Works by night and by day up to the output of a machine every 40 seconds? The cause is plain. The answer is simple. It is The Building of the Best in the World. Almost seventy seasons of success have elapsed since Cyrus H. McCormick invented the Reaper in 1831. In all that time the McCormick has been The Best Built Machine in the World. The McCormick Machines for 1899 are The Best in the World. The McCormick Right Hand Self-binding Harvester; the New 4 Mower 4½ and 5 ft. cut; the Big 4 Mower 6 ft. and 7 ft. cut; the One Horse Mower, 3½ and 4 ft. cut; the Folding Daisy; the Corn Harvester; the Corn Husker and Fodder Shredder and the Hand and Self-dump Hay Rakes 8 ft., 10 ft. and 12 ft. are The Best in the World. All these eight machines are McCormick End of the Century machines; built with a brilliance of invention and honor in construction that sets a noble standard to all other agricultural machines on earth.

McCormick Harvesting Machine Co.
CHICAGO.

Farmer's Handy Feed Cooker.

Reader's attention is called to this device, which is sold at $12.50 for 50-gallon capacity. By feeding poultry and animals cooked food during winter at least one-third of the feed is saved; also having stock in a healthy condition, preventing hog cholera among your hogs and insuring the hens laying freely during the winter months. On application to the Empire Manufacturing Co., Quincy, Ill, a catalogue giving full description, may be obtained. They are made in all sizes.

Hood Farm Jerseys

Yearling Bull.—Two year's test of dam, 23,141 lbs. 10 oz. milk, 1,211 lbs. 10 oz. butter. Solid color, black tongue and switch of excellent dairy form. Sire, Chromo, of World's Fair fame, sire of 8 tested daughters, by Diploma, sire of 42 in the 14-lb. list, including Merry Maiden. Dam, Oneida, test, 16 lbs. 13 oz., 50 lbs. 5 oz. milk in one day, 12,734 lbs. 11 oz. in 1 year, testing 648 lbs. 12 oz. butter. Write for price to HOOD FARM, Lowell, Mass.

Large Milking

JERSEYS

FOR SALE.

Large milkers mean large butter makers. Cows in this herd have milked as high as 13,000 lbs. a year and produced a calf. One year (1893) the herd (90 head) averaged 7,300 lbs. and produced a calf, heifers counted a full cow.

This herd is well known for its heavy milkers and butter makers, as well as in the show ring never was beaten. For 15 years won First Prize, Sweepstake Prize (bull and cow), Herd Prize, etc., at the St. Louis Fair, when this fair had the best live stock shows ever in this country, 1875 to 1893. Can give you the blood of **Coomassie, Victor Hugo, Combination, Paddy,** and others. No Catalogue. State in full what is wanted.

Four Choice Young Jersey Bulls

9, 10, 11, 12, months old. Prices reasonable.
CLEARVIEW STOCK FARM, Butler, Pa.

and those that did finally respond, did so after one or more years additional exposure If constitution has anything to do with giving an animal the ability to ward off disease, then the dairy type cow has demonstrated that she has a good constitution. There were three Polled Angus in the herd at the time of the test referred to, each was specially strong in depth and breadth of chest, and had what is generally termed good lung and heart capacity. They were fat and sleek, and yet they proved to be badly diseased.

Taking all the testimony accumulated at this station during the past five years, we would be warranted in assuming that the liability to contract disease depends upon the amount of tissue in a body. So, other things being equal, the sparer the cow, the less the liability to become infected.

T. L. HAECKER.

Minnesota Experiment Station.

Our Special Elgin Letter.

ED. HOARD'S DAIRYMAN:—There was a very small offering of butter on Monday's Elgin Board of Trade, but 3,000 pounds being placed. Bidding opened at 22¾ cents and advanced to 23 cents; 540 pounds were withdrawn from sale with 23 cents bid, and 2,460 pounds were sold at that figure. The Quotation Committee did not consider the sale price as representing the true condition of the market, and declare the market active at 22 cents, with the following sales reported:

Factory.	*Pounds.*	*Price.*
Red Clover	1,800	23cts.
McConell	660	23cts.
Total	2,460	

The markets for the corresponding week of the three preceding years were as follows:

Feb. 14, '98, 6 480 lbs. of butter sold at 19cts.
Feb. 15,'97, 28,500 lbs. of butter sold at 20⅛@21cts.
Feb. 17, '96, 33,120 lbs. of butter sold at 19 cts.

No New York quotations received, Monday.

H. C. B

Elgin, Ill, Feb. 13, 1899

CONCERNING OUR ADVERTISERS.

WHAT EVERY FARMER WANTS.

There are some things a progressive farmer ought to have, for example: a large garden, a bearing orchard, a sharp plowshare, a milk test, a sprayer, a horse the women can drive, a flock of sheep, a nice hen house, a roof that never leaks, gates that never sway, a sweet cellar, a kind heart, a sound stomach, a half dozen sons and daughters, and a stiff upper lip; and there are some things he *must* have—three or four live farm papers, a good wife, a clear conscience, and an Acme harrow.

To the lover of good Jerseys, no greater treat could well be offered at present than a visit to P. J. Cogswell's "Exile Herd," at Brighton Place, near Rochester, N. Y. The barns erected a short time since, to replace those destroyed by fire, are models of simplicity and convenience, and furnish sanitary conditions, leaving little to be desired. The ventilation is especially good.

There are at present about one hundred cows in this herd, of which about forty are daughters of "Old Exile," and nearly all the balance are grand daughters, showing a large percentage of his blood. I doubt if there is to be found anywhere so large a herd showing so much of the blood of one sire, and such universal excellence. Among others, Exile's sixty-sixth tested daughter —Exile's Euphorbia, a beautiful young cow, carrying a large, finely shaped udder. She has recently made a test of over sixteen pounds.

Another excellent cow was Exile's St. Lambert's Queen. She has made twenty-one pounds seven and one-fourth ounces of butter in seven days. She is a typical dairy cow, and shows great capacity.

Perhaps the most showy cow in the herd is Exile's Claribel 107,507. She is a magnificent large cow, not in any way coarse, but showing marked dairy tendencies. Her color is a very light silvery fawn, and she carries an enormous udder. She has a test of fourteen pounds and five ounces. She is a daughter of Exile of St. Lambert by Rioter's Grace 61993.

A large number of notable animals might be mentioned, but among such general excellence it is hard to specify individuals. There are undoubtedly herds showing a large number of show cows, but doubtful if there is anywhere one showing a greater number of excellent cows, the de scendants of one sire, and raised by one breeder.

SAVES WAGONS AND HORSE FLESH.

A lubricant that is both slippery and durable is mica, and the axle grease made from mica, and named Mica Axle Grease, has been found to work better and wear longer than any other axle grease on the market. It does not run in hot weather nor gum in cold weather, and being a mineral substance of peculiar toughness it is extremely durable. The use of axle grease should never be neglected, partly to save wear and tear on the wagon, but principally to save horse flesh, and in buying it it pays to buy the best

J. R. Brabazon, Jr., & Co., of Delavan, Wis., whose advertisement appears on another page of this issue, notify us that they have been obliged to treble the capacity of their plant to meet their growing trade.

This they did by building one of the largest and most completely equipped poultry houses in the West. They have given particular attention to the breeding pens which are secure, large and roomy and well calculated to produce best results.

Mr. Brabazon, the head of the firm, has spent a life time in the poultry business and is well equipped for his chosen calling. They have just issued the second edition of their 1899 catalogue. It is a splendid work, printed in colors and containing much of value to everybody interested in poultry. Send ten cents in stamps and procure a copy. It is worth many times this small cost.

ED. HOARD'S DAIRYMAN:—I wish to report a weekly test of Loa, No. 107279, a four-year-old. She gave for the week ending Jan. 31st, 254.7 lbs. of milk which made 16 lbs and 1 oz. butter, her largest days' milk was 37.3 lbs. She was not crowded for a record but is being fed for business the year round, her daily ration consists of bran 10 lbs., gluten meal 4 lbs., ensilage 35 lbs., and a small feed of dry corn stalks with what clover hay she will eat. Her sire is Prince Noble, No. 22198, and her dam is Ediths Faith, No. 19724, with a butter record of 19 lbs. in 7 days.

F. H. SCRIBNER.

816 bushels, 21 pounds oats from 7 bushels seed, or an average of 116 bushels of seed sown has been reported from the Lincoln oats and even in unfavorable seasons these grand oats yielded from 20 to 45 bushels more per acre than other kinds of oats sown side by side.

The Farmer Seed Company, Fairbault, Minn., makes a specialty of growing the best varieties of seed grain, grown on their farms on clean land and free from any foul seeds and any of our readers looking for improved varieties of seed grain or those interested in more grass and better and permanent pastures and meadows should write for their new catalogue or book on permanent pastures and meadows, which is sent free to all farmers.

BUY THE BEST.

If you want the best low down wagon you should buy the Electric Handy Wagon. It is the best because it is made of the best material; the best broad tired Electric Wheeler; best seasoned white hickory axles; all other wood parts of the best seasoned white oak. The front and rear

hounds are made from the best angle steel, which is neater, stronger and in every way better than wood. Well painted in red and varnished. Extra length of reach and extra long standards supplied without additional cost when requested. This wagon is guaranteed to carry 4000 lbs. anywhere. Write the Electric Wheel Co., Box 130, Quincy, Illinois, for their catalogue which fully describes this wagon, their famous Electric Wheels and Electric Feed Cookers.

IT PAYS TO BE CONVINCED.

Some men are terribly afraid that they will be convinced of their wrong practice. Others do not want to carry an error another minute if they can find a better way. Mr. T. T. H., of McKeesport, Pa., writes:

"I have been selling milk in McKeesport for eleven years. Recently I saw a copy of your paper, then subscribed. Have read five numbers and am surprised at what I don't know about dairying."

What was it that gave him that important information? Reading the DAIRYMAN. Are there not many others who need the same knowledge?

ONLY $1 FOR 52 ISSUES WILL BRING IT. TRY IT!

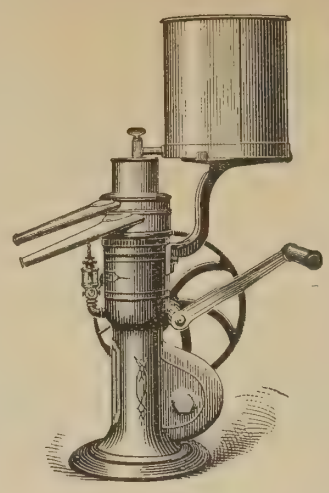
Silo Building and the Ensiloing of Cow Pea Vines in Georgia.

ED. HOARD'S DAIRYMAN:—In your issue of the DAIRYMAN giving me a balanced ration for my herd of Jersey cows, you take occasion to say that the successful ensiloing of cow pea vines by me was a matter of national importance to the dairy interests in the south. Inasmuch as you have seen proper to speak so highly of my venture in the ensiloing of cow pea vines, I deem it proper that I should give for publication in your valuable and widely read journal the plan I adopted for building a silo, my method of raising cow pea vines, my experience in the ensiloing of the same and the feeding of the silage to dairy cows.

SILO.

I have an all-wood round silo, 27 feet high and 20 feet in diameter inside. I built my silo to the plan given on page 16, Bulletin No. 59, issued by the Wisconsin Agricultural Experiment Station. The sills are of post-oak, size 4 x 6" cut in two foot lengths of the circle of the silo, the sections of the sills being "toe-nailed" together, making a circle 20 feet in diameter, which is then bedded in cement mortar and levelled. The timbers for the plates are cut in like manner, except from yellow pine, size 2 x 4," and in lengths of two feet. The studding is of yellow pine, size 4 x 4," cut in lengths of 27 feet, "toe-nailed to the sills every 12 inches from center to center. The sections of the plates are spiked directly upon the tops of the studding, doubling them, and thus making the plates when completed 4 x 4". In framing my silo I put a round post 12 feet long and 8 inches is diameter in the center of the silo, about two feet in the ground; and as each stud was "toe-nailed" to the sill it was made plumb and was secured by nailing a board to the stud and to the center post. The lining is made of kiln-dried cypress boards, one half inch thick and five inches wide, dressed on both sides and edges to a uniform width and thickness. This lining is nailed on the inside of the studding with 8 d. wire nails, horizontally, close together. A layer of 3 ply Giant P. and B. paper is tacked on horizontally to the first layer of cypress lining; then a second layer of cypress boards is nailed on horizontally, with the same kind of nails as before, breaking the joints of the first layer. A second layer of paper, similar to the first, is tacked on the second layer of cypress boards. Then a third layer of cypress boards is nailed on horizontally, with 10d. wire nails, breaking the joints of the second layer. I have three feeding doors, size 2' 6"x3" with a dormer-window of the same size, for filling the silo. It is weather-boarded on the outside with the same material as the lining. The roof is of tin and of a conical shape.

I think I have as complete and as nearly perfect and well built silo as there is in the south. When all three of the feeding doors are closed my silo is absolutely air tight, and will hold water equal to a barrel.



COW PEA VINE SILAGE.

I sow cow peas early in June on my wheat and oat stubble, broadcast; about one and one-half bushels to the acre. I have them turned under with a one-horse turning plow, then drag the land with an iron tooth "Thomas Harrow." Nothing more is necessary until the vines are ready for the silo. The time to harvest the cow pea vines for silage is when one-half or more of the peas on the vines are ripe. Care should be taken not to harvest the vines before they are fully matured, as when green they are very succulent. If cow pea vines are put into the silo when too green, or when they contain too much moisture, the pressure in the process of settling is liable to express the juices from the tissue and cause it to filter away, thereby entailing great loss.

I use a McCormick mower to cut the vines. I then pile them at once in wind-rows with a two-horse steel rake, and haul them immediately to my silo, where they are cut with a feed cutter made by the Silver Manufacturing Co., at Salem, Ohio, and called by them "Ohio No. 16." It has a carrier feed and also an elevator. The vines, after being cut in lengths of from one-half an inch up to three inches, are dropped into the elevator and carried to a dormer-window some thirty feet from the ground and emptied into the silo. I keep two stout, able-bodied men in the silo all the while it is being filled, one man with a pitchfork to level and evenly distribute the vines as they are put in, and the other to tramp them down while the filling is going on. After the silo is filled and while the settling is going on, I have two men to tramp the silage down thoroughly a few hours every day for about ten days. I then run green marsh grass through my cutter until I get a layer on top of the silage six inches or more in depth for a cover. This cover I wet quite liberally, using one pail full or more of water to the square foot of surface, which soon develops a thin, well-rotted top layer, making an almost air-tight cover for the silage. I then leave it alone and trust to Providence.

I closed my silo containing about 125 tons of cow pea vine silage the latter part of September, 1898. A thick mold soon came over the entire surface and remained intact until I opened my silo early in January of this year. I found the silage in a perfect state of preservation, with only about 15 inches on top, including the covering, unfit for use. As I feed downward, I find the silage perfectly sound on the sides and next to the walls of the silo.

My cows soon learned to eat cow pea vine silage. They now take it with great relish, and are as fond of it as a child is of candy. It is a most excellent feed in every particular, and there is nothing better as a butter producer. I consider its feeding value equal to, if not superior to anything that can be produced on the farm. The richness of cow pea vine silage in a large measure depends upon the quantity of cow peas on the vines at the time they are harvested. The cow pea vines I ensiloed the past season were very full of peas. I generally sow two varieties, the Clay pea and the Unknown pea. Any kind of cow pea, however, will answer for silage that will produce long vines and a heavy crop of peas. In order to have a luxuriant growth of vines and an abundant crop of peas, I would advise (for Georgia) that the peas be sowed as early in June as possible. The cow pea is a wonderful land improver. I only came in possession of my present plantation three years ago. I found it greatly impoverished, and I am now building it up quite rapidly by sowing it down in wheat in October and in cow peas the June following. If my land continues to improve hereafter as rapidly as it has during the past two years, in less than five years it will almost, if not quite double its yield. I never turn under cow pea vines. They are too valuable for silage. I only turn under the cow pea vine stubble and roots at the time I prepare my land for oats and wheat in the fall. In filling a silo with cow pea vines I would not advise letting it stand too long between intervals of filling. Long

THE NEW BOOK
Feeds and Feeding

By Prof. W. A. HENRY.
Wisconsin Experiment Station.

This book should be in the hands of every stock feeder in the country. Every reader of HOARD'S DAIRYMAN ought to have it. It is a large, well bound book, nicely printed, over six hundred and fifty pages. Price $2.00.

Four Yearly Subscribers at $1.00 Each ($4) Will Secure It as a Premium.

or

Four Yearly Subscribers at $1.00 Each ($4) Will Secure It as a Premium.

Of This Book Hon. JAMES WILSON, Secretary of Agriculture, Washington, writes as follows:

"Prof. W. A. Henry, Dean of the Agricultural Department of the University of Wisconsin, has recently given to the American student and the American farmer a work on feeds and feeding. Singularly enough, up to this time we have had nothing along this line sufficiently comprehenisve from both the scientific and Practical standpoints. We have had very able works from both, but Prof. Henry is the first to combine science with pratice, and give us a work that will be of value alike to the instructor in the Agricultural College, to the student who is seeking the principles underlying feeding, and to the practical farmer who feeds.

This publication will take its place immediately in the college library, and ultimately in the private library of every farmer in the land. When the instructor, student or practical farmer inquires where there is a work thoroughly exhaustive of this subject, he can now be refered to Prof. Henry's book.

Send as above, or will be forwarded, carriage paid, on receipt of price $2.0

standing allows molding to start, which tend to produce a waste, even after the next layer is put on. I consider it best to fill gradually, as well as continuously, after the filling begins.

I cannot close without publicly thanking through these columns Prof. F. H. King, of the Wisconsin Agricultural Experiment Station, for the valuable information he gave me in regard to the planning and construction of my silo; also for the excellent advice he gave me on the making of silage from cow pea vines and filling the silo. I would be very glad indeed to have Prof. King to come down and pay me a visit. He would see much that would interest him; and would, no doubt, enjoy a trip to Georgia.

THOS. C. CRENSHAW, JR.
Carversville, Ga.

A Young Farmer and His Ration Criticised.

ED. HOARD'S DAIRYMAN:—I am a young farmer and would like to know if the following ration is a good one. If not, please correct it. I am feeding ten cows, grade Jersey and Holsteins of good size, 20 pounds of good clover hay, 10 pounds of corn stover, 24 pounds roots (carrots, sugar beets and mangels, equal parts) and 6 pounds of grain, which is half bran and half corn and oats ground. Hay is worth from $4 to $5 a ton; bran, $15; oats, 28c and corn, 35c, shelled. Can get oil cake meal at $1 to $1.25 a cwt.

JOHN G. BLANK.

Every young farmer ought to put himself in the way of being able to answer these questions for himself. They are not difficult or intricate. Take the table published on page 789 and see there what per cent of digestible nutrients are contained in the various feed stuffs. For example, take timothy hay: In every 100 pounds of average timothy hay, as it comes out of the mow or stack, there are 86.8 pounds of dry matter, (the balance, 13.2 pounds, being water), and in this dry matter there are 2.8 pounds of digestible protein 43.4 pounds of digestible carbohydrates and 1.4 pounds of digestible fat (ether extract) or in all, 47.6 pounds of digestible nutrients, and the balance of the dry matter, amounting to 39.2 pounds, is undigestible woody fibre, etc., which passes off in the solid excrement.

If one feeds 20 pounds of timothy hay, or 15 pounds, or more or less, it is not a difficult problem to ascertain the total amount of dry matter and the amounts of the different digestible nutrients contained in this dry matter.

If it becomes necessary to increase the amount of protein in a ration, we must select feeds relatively high in protein, like the clovers in hay, and like bran, glutens, cotton seed meal, oil meal, oats, etc., in grain, and all the time seek to get what we need at the least cost.

This particular young farmer, who signs his name Blank and omits to give his residence, thus preserving an impenetrable incognito, is feeding as follows:

	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
20 lbs. clover hay	16.94	1.36	7.16	.34
10 lbs. corn stover	5.95	.17	3.24	.07
8 lbs. carrots	.91	.06	.62	.02
8 lbs. sugar beets	1.08	.09	.82	.01
8 lbs. mangels	.73	.09	.42	.01
3 lbs. bran	2.64	.38	1.16	.09
1½ lbs. corn	1.34	.12	1.00	.07
1½ lbs. oats	1.34	.14	.71	.06
Totals	30.93	2.41	15.15	.67

The first thing that attracts attention here is the great surplus of dry matter, which indicates that the cows do not eat all that is placed before them, and consequently there is waste. If there is one thing, more than any other, that handicaps the farmer, and particularly the dairy farmer, it is this omnipresent demon of waste, in its endless variety of forms. We undertake to say that the avoidable wastes on every nine out of ten farms, is sufficient to pay all the taxes, direct or indirect, that are levied upon the owner and leave him a sufficient margin to take a two weeks' vacation and travel two thousand miles.

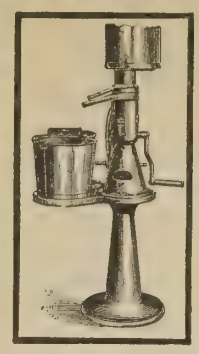
It is simply impossible to catalogue all these wastes, and it is no part of our present purpose to treat of any not indicated above, but there are very few of our readers who cannot indict and convict themselves, sometimes of being penny-wise and pound-foolish and sometimes of deliberate and utter disregard of the plainest dictates of reasonable prudence. If a fireman on a locomotive engine should habitually use 40 pounds of coal (costing about 4 cents) per day more than was necessary, he would secure a prompt discharge. If the head sawyer in a lumber mill does not watch each log and see that it is cut so as to yield the largest proportion of the highest priced lumber, the business will be ruined.

So on the farm, if the herdsman, be he owner or hired man, feeds every day more than the cattle can eat, or uses high-priced feed where something costing less would answer an equally good purpose, or the butter maker turns out an article that must sell below the highest market price, there is waste.

Twenty-six pounds of dry matter per day is about the maximum that the stomach of the 1,000-pound cow can take care of. If this is given to her in the form of 30 pounds of marsh hay, it will just about suffice for her bodily maintenance, and 20 pounds of first-class timothy hay will answer the same purpose, because of its greater per cent of nutriment. Our young farmer is therefore feeding from 5 to 6 pounds more dry matter than his cows can use. Moreover, he is feeding oats, which when ground, practically cost him $20 per ton, when he could get more value for less money from the glutens or oil meal or cotton seed meal. So long as the roots last he does not particularly need the oil meal, and we would use, say, cotton seed meal, and our formula would be something as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
15 lbs. clover hay	12.71	1.02	5.36	.26
Stover, roots, bran and corn as above	12.65	.91	7.26	.27
1 lb. cotton seed meal	.92	.37	.17	.12
Totals	26.28	2 30	12 79	.65

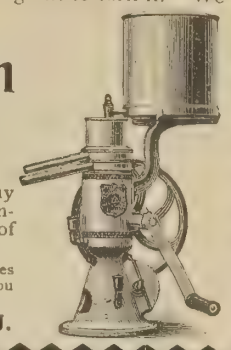
TWO MISTAKES.



There are two mistakes that people with weak lungs are liable to make; and both are about equally bad: One is to not give attention quickly enough to the little coughs and bronchial troubles which so rapidly undermine the delicate lung tissue and plunge you into consumption almost before you are aware of it; the other is when the trouble is at last discovered and fully realized to give up hope too soon.

Begin with these bronchial and throat ailments the instant they appear; never wait till to-morrow. The right remedy taken now may save months of severe illness. On the other hand if the illness has already come upon you; and you find yourself weakened, wasted and discouraged, do not lose hope. There is a medicine that will certainly restore you to health and strength.

"My boy was in a very bad way when I commenced to give him Dr. Pierce's Golden Medical Discovery," writes J. W. Price, Esq., of Ozark, Monroe Co., Ohio, in a recent letter to Dr. R. V. Pierce of Buffalo, N. Y. "The doctors claimed he had consumption and we doctored with them until he was past walking. After using five bottles of the 'Discovery' he is now all right. It has been ten months since he stopped taking your medicine and he is still in good health. We are very thankful to you for saving our son."



Hundreds of similar cases are described in one chapter of Dr. Pierce's great thousand-page illustrated book The People's Common Sense Medical Adviser which will be sent free for the bare cost of mailing, 21 one-cent stamps. It is a veritable family library in one volume;—the fruit of Dr. Pierce's life-long experience with the severest types of obstinate chronic diseases. Any one may write to him for advice; which will be sent in a plain sealed envelope, free of charge.

A Hand Separator

to be profitable must not only extract every particle of butter-fat from the milk, but must run so easily that it does not require the strength of a giant to turn it. We guarantee the

Empire Cream Separators

to run 50 per cent. easier than any other of equal capacity. Their record for clean skimming is unequalled. We have the most complete line of hand separators in America; also power machines.

We have not space here to tell you why the **Empire** machines excel all others, but it's all in our catalogue. Send your address if you have one cow or one thousand.

ILLUSTRATION.

The name of Ellwood has been a name to conjure with, in the sale of farm fencing, for, lo, these many years. It needed not the award of a gold medal first prize at the Omaha exposition last year to convince the fencing public that whatever fencing bore the name of Ellwood stood at the very top of its class, but the gold medal was awarded nevertheless on the very broad and comprehensive claim of, the best steel woven wire fencing for farm, ranch, railroad and general use.

ELLWOOD FIELD FENCE (STANDARD STYLE) MADE IN SIX HEIGHTS.

This award was made to the American Steel & Wire Co., which is now manufacturing all the wire products for which Ellwood and the DeKalb Mills have become so justly famous.

The illustration herewith, shows the Standard Style of Ellwood Woven Wire Fencing, which is made in any of the six heights shown in the cut, each height, either by itself or by the addition of a cable or two of the Ellwood famous Glidden Barb Wire at the top, a perfect fence for every practical purpose. This is a cattle fence, a horse fence and a perfect hog and pig tight fence. The wires are all best hard Bessemer steel, the horizontal cables being twisted and coiled to provide for the expansion and contraction, and are most thoroughly galvanized, being practically rustproof and assured of the longest possible life.

It is the purpose of the manufacturers to have an agent for the sale of Ellwood fences in every city, town and village, and agencies are being located as fast as possible. Should none be as yet established in your town all information necessary to securing the Ellwood fence in any quantity, can be had for the asking of the American Steel & Wire Co., Chicago, Ill.

In replying to A. M. W., of Michigan, we took the opportunity to discuss the feelings of publishers in regard to non-renewing subscribers, and had something to say about the steadfastness of those who continue on year after year, and the reasons for their doing so. At that writing we did not know that there was lying on our table confirmatory proof of what we were saying, but after working down the pile several numbers, we came to C. D. A's. inquiry, wherein he states that he has been a constant reader for five years, and finds that the more he knows, the more he wants to know, and, hence, cannot carry on a dairy without the DAIRYMAN.

We hope the advice may be too late for practical use this winter, but the unprecedented cold of the last two weeks (this is February 11th,) admonishes us to say that the colder the weather, the more feed does it require to maintain the body temperature. In times like this an extra pound or two of corn meal would not be amiss.

VETERINARY.

Queries in this department answered by WM. HORNE, M. D. V. S., Janesville, Wis.

COW PHYSIC—Three-fourths to 1¼ pounds Epsom Salts (according to age and size of animals) and two ounces of best ground ginger. Pour over this three pints of boiling water. When at 105° F., give gradually as one dose.

RETENTION OF PLACENTA. EXTRA TEAT.

1. Four-year-old Jersey cow gave birth to calf seven days ago, but did not pass the afterbirth. Had a man who claimed to know how to take it away, in about thirty-six hours after she gave birth to calf. Now, occasionally, she passes some dirty, riley looking water that smells terrible, yet she will pass water sometimes, that looks natural and all right. Since I noticed this discharge, have flushed her with carbolic acid and water.

2. Have Guernsey heifer ten months old; has small teat about one-half inch long on the side of its natural teat. Can this be taken off without injury? R. W.

Janesville, N. Y.

ANSWER.

Decomposed animal matter—afterbirth—which is rotting away. One of the most delicate operations of common occurence, in my practice, was to carefully remove all the afterbirth. When portions of the afterbirth are left inside, the rotting matter must find an outlet somewhere, and that is at the vagina, of course, hence, the matter you refer to. No, I never use so-called carbolic acid. Tilden's Bromo Chloralum, one to eight of water is, in all respects, much better, and is perfectly safe to use.

2. No, let the exrta teat alone.

SWELLING OF BRISKET.

Please give the directions for the treatment of a cow affected in the following manner: Hard swelling of brisket, without fever, appetite good, gives usual amount of milk, in fact seem to have no visible effect, excep the swelling. A. B. D.

Alexandria, Va.

ANSWER.

Rub three times a day with Gombault's caustic balsam, when the parts become sore; cover with hog's lard until the scabs are all off, then repeat until not needed. Keep from rubbing. If she becomes feverish, give the full dose of physic as per head of this column.

BLOODY MILK.

What is the cause of blood in milk from our cows. We feed as follows: About one-half oats to one-half barley. This is ground together. To a ton of this feed we put in about 300 pounds bran and 100 pounds oil cake. Of this mixture, we feed 60 pounds per day to twelve cows. They get all the millet hay they will eat up clean and artesian well water. P. J. B.

Buxtor, N. D.

ANSWER.

Immediate full dose of physic and repeat in five days, and repeat in seven days if needed. Each morning give two teaspoonfuls of nitre for ten to thirty days, as the case seems to demand. The causes are multifarious. Commonly a cold draft direct upon the udder. In fact, anything that in anyway interfers with a normal condition, especially if local.

TOO MUCH WATER.

I have a two-year-old part Jersey steer that I have been stall feeding. That is, I gave him all the Alsike clover he could eat, and two ears of corn twice a day, and water three times a day, and was let out in yard to exercise on warm days. He suddenly refused to eat or drink, and passed nothing, but was perfectly lively. I gave him a neighbor's remedy,—that is, I forced all the

THE FAMILY DOCTOR.

Thousands of Families Have One in the House at All Times.

THE SAME EXCEPTIONAL OPPORTUNITY OFFERED HERE TO ALL READERS OF THIS PAPER.

A prominent citizen remarked recently: "It may seem surprising to you, but in my house we have a family doctor there all the time. Nor am I the only one who has this great blessing." said he. "I know of many families who have this same doctor always on hand, always within reach."

"Do I mean a man, a physician, in flesh and blood?" he asked. "No, not exactly that; the family doctor that I refer to is Dr. Kilmer's Swamp-Root, the great Kidney, Liver and Bladder Remedy. We have not had to call a doctor to our house since we have used it."

This is the teitimony of thousands who know Swamp-Root for what it is. This famous medicine is the absolute conqueror of kidney and bladder diseases, and many a man and woman who walk the streets today in the complete possession of health owe their lives to the power of this great discovery over kidney and bladder ills and uric acid disturbances. In diseases of the blood, no matter from what source they arise, Swamp-Root goes right to the source of the trouble, and cures by first removing the cause, and sends the blood leaping and bounding away in quest of bright eyes and rosy cheeks.

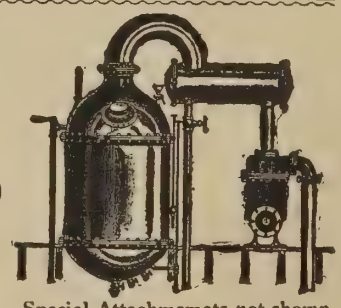
Constipation and liver troubles, urinal weaknesses and the torture that goes with them, rheumatism, stiff joints, in fact, diseases arising from any wrong condition of the blood, liver, bladder or kidneys are promptly overcome by Dr. Kilmer's famous discovery, Swamp-Root.

None but those who have made a study of the subject realize what an immense amount of work the kidneys perform every day. They are the sewer of the system, and once they become clogged up, poison runs riot and disease has full sway. Just as a choked sewer breeds pestilence in a city, so do weak and unhea'thy kidneys breed disease in the human body.

Swamp Root clears out all the impurities, helps the kidneys to perform their work properly, drives the poison out of the blood and system, invigorates and regenerates you and adds tenfold to the pleasures and comforts of life.

Swamp-Root has been tested in so many ways, in hospital work, in private practice, among the helpless too poor to purchase relief, and has proved so successful that a special arrangement has been made by which all readers of the DAIRYMAN, who have not already tried it may have a free sample bottle of Swamp Root and thus test for themselves its wonderful curative properties.

If you will send your name and full address to Dr. Kilmer & Co., Binghamton, N. Y., a sample bottle will be sent absolutely free by mail, post-paid, also a book telling more about Swamp-Root and containing some of the thousands upon thousands of testimonial letters received from men and women who owe their good health, in fact their very lives, to the wonderful curative properties ot Swamp-Root.



This great remedy is for sa'e at most drug stores in fifty-cent and one-dollar sizes. Don't make any mistake, but make a note of the name, Swamp-Root, Dr. Kilmer's Swamp-Root and remember that it is prepared only by Dr. Kilmer & Co., Binghamton, N. Y.

If you take advantage of this generous offer and write for a free sample bottle be sure and mention the HOARD'S DAIRYMAN when sending your address to Dr. Kilmer & Co., Binghamton, N. Y.

"PURIFINE" A BOON TO THE GREAT DAIRY INTERESTS.

A POWERFUL Disinfectant That is ODORLESS, NON-POISONOUS. Used in Creameries, Cheese Factories, Dairies and Stables.

IT DOES NOT Create an Odor to Destroy One.

SAN FRANCISCO, SEPT. 22nd, 1896.
I have used "Purifine" in cleansing milk cans and bottles and find it will remove the bad odor left by old sour milk more effectually than anything I ever tried.
E. A. GREEN, Sec'y,
Millbrae Dairy Company, Mission & 9th.

Applied with large quantity of water, which makes it cheap and convenient of use. It is invaluable to the cleanly dairyman or factory operator. Once try, you'll never be without.

SEND $1.00 FOR SAMPLE GALLON by Freight.

This powerful disinfectant creates no odor of its own, but will keep creamery, cheese factory and dairy pure and sweet. TRY AT ONCE.

FITCH CHEMICAL COMPANY, Bay City, Michigan.

Seeds that Make Money for the Farmer....

You can make money with little trouble on a second crop, after you harvest oats or early potatoes. True Dwarf Essex Rape matures a full crop of fodder in six to eight weeks after sowing. Furnishes feed unsurpassed as a fattener for sheep and hogs. Superior to clover.

At the Michigan Experiment Station 128 lambs pastured for eight weeks on five acres of rape, showed a gain of 2,890 pounds or three pounds a week, at total cost of $6.00.

May be sown up to August 1st. Enough seed for an acre sowing for 30 cents. For prices of larger quantities, see our catalogue, which will be mailed free on receipt of request.

CURRIE BROS., Milwaukee, Wis.

water I could into him, about four pails (eight quarts each) a day for four days. During this time I gave him four doses of flax seed tea, one pint of flax seed cooked in eight quarts of water. He passes water and has had some soft passages, but he refuses to eat. He is in pain after I give him the water, but is perfectly lively. I lost a steer with the same symptoms a month ago.

Lena, Wis J. L.

ANSWER.

You seem to have ignored your privilege of the advice at the head of this column as to the best physic for a cow. Poor steer, how could you so torture him by half drowning him? How would you feel under similar conditions? Well may the poor creature be in pain. It is a poor opportunity for me to help the case at this stage. I know of nothing so good as elimination by judicious physicking. Then, after, give half ounce doses of golden seal in four ounces of water, and half a dram of nux vomica, up to five doses, two days between, after the physic.

INDIGESTION.

1. My cow stood at her bunk eating hay when suddenly she began to back and went backward for fifteen or twenty feet. I spoke to her and she went back to her place. This was after milking and she gave her full mess. In the morning when I went out to feed, her head was turned to the left and she was licking her side and turning round in a circle and would sometimes fall down At night she gave as much milk as usual and now seems all right.

Gave her, in the morning, one quart of linseed oil and through the day, four quarts of hop tea. About two years ago she had a similar attack.

Feed consists of coarsely ground corn meal with cob, about twelve quarts per day, and four quarts of ground oats. She was not bloated and did not have any fever that I know of.

2. Yesterday morning while feeding, I noticed another cow that did not come up to her feed as usual; so I drove her into the stanchion and fastened her up until I was taking the feed out of her bunk. She tried to get hold of me with her mouth, twice. I got the feed out and then she threw her head up, gasped for breath and tried to get loose. I let her out of the stanchion and then she held her head up as high as she could get it and swinging it from side to side and then laid down and throw her head back as far as she could get it for a few minutes and then get up again.

No fever and no bloat as I could see.

Both cows give about four gallons of milk per day and get the same care. Gave last cow about the same treatment as first one.

Maynesville, O. C. P. S.

ANSWER.

No. 1. Why did you give oil? Why not read the physic at the head of this column and give as directed there? I believe the unground, indigestible, particles of the cob were responsible for the condition you name. Stop the cob feeding.

No. 2. I think the same cause was to blame for your symptoms. Stop it. Hops are tonic and slightly narcotic. It is a good quieter of nerves, excitement, sleeplessness, etc.

Ruptured 20 Years

Wonderful Cure of a Well Known Citizen of Wisconsin.

R. M. Wilsie's Good Fortune in Overcoming His Affliction.

It is a piece of good fortune to relate the fact that there is a sure cure for rupture. Some people contend that only a surgeon with a knife and a needle can bind the broken place together. but

MR. R M. WILSIE, Brandon, Wis.

the experience of R. M. Wilsie, of Brandon, Wis., completely upsets this theory.

There is a doctor in Adams, N. Y., who has discovered a marvelous system of treatment that not only retains any kind of a rupture but also causes the muscles to grow together. Mr. Wilsie heard of it and gave it a test. The results were astonishing.

Although 61 years of age and badly ruptured for more than 20 years, Mr. Wilsie began to mend at once and was perfectly cured in a remarkably short time. Today he is hale and hearty, a fine looking gentleman and completely restored from the slightest trace of rupture. He naturally recommends the system highly. His cure excited considerable interest among his neighbors many of whom were also ruptured and who have since been cured.

The system of cure is the discovery of Dr. W. S. Rice, one of the best known rupture specialists in the country. He has recently issued an illustrated book on the subject of rupture and sends it free to every one; his object being to disabuse the public mind that rupture cannot be cured. The beauty of his system is the absence of all pain; absolute immunity from danger; no operation of any kind, and not the loss of a minute's time from work. This is a subject well worth inquiring into. Thousands of people have friends who are ruptured and they will do them a lifelong service to tell them of this new and marvelous home cure. Send for the book. It is free to all. It fully explains the system of cure and is immensely valuable to all who are ruptured. Write at once to Dr. W. S. Rice, 353 L. Main St., Adams, N. Y.

OUR LINCOLN OATS

has proven itself to be the best White Oats that is now grown. From 7 bu. of seed there were 717 bu. and 21 lbs. harvested, or **116 bu. from 1 bu. of seed sown.** It is not a new and untried variety any more, but has been grown long enough in every state and yielded more by 20 to 45 bu. per acre than other Oats. Here are a few of the many hundreds reporting their results:

MR. P. HEITRITTER, Sioux Co., Ia.—From 5 bu., sown, threshed 320 bu. machine measure, but 400 bu. by weight.

MR. D. KELLEN, Nobles Co., Mich.—Sowed one sack (2½ bu.) and threshed 160 bu. machine measure. but 200 bu. by weight.

MR. T. DALEY, Walsh Co., N. D.—Had a yield of 118 bu. from one sack (2½ bu.) of seed.

Mr. L. ALBERS, Will Co., Ill.—Sowed one sack (2½ bu.) on one acre and had a yield of 70 bu. machine measure, which weighed out 93 bu.

MR. J. BOSSEN, Clinton Co., Ia.—Says that he threshed 20 bu. more per acre from our Lincoln Oats than from all other kinds.

D. NERO, Ozaukee Co., Wis.—Threshed 1230 bu. from 30 bu. of our Lincoln Oats, which weighed 40 lbs. per measured bu.

So write many hundreds of our brother farmers who had crops like these even in unfavorable seasons. Our Lincoln Oats will do as well with you and if you can average 25 bu. more per acre than from other kinds of oats it will pay well to sow nothing but our Lincoln Oats. Our prices this year are very reasonable. 1 bu., **75c.**; sack of 2½ bu., **$1.70**; 5 bu., **$3.25**; 10 bu., **$6.00**; 20 bu., **$11.60**; sacks included.

We are farmers and grow our seed and can therefore make reasonable prices to our brother farmers. Our catalogue will interest you, we send it free to all farmers; write for it. Seed Grain and Grass Seeds are our specialties and before you buy your grass seed you should see our catalogue or book on Permanent Pastures or Meadows.

A Silo Question for Mr. Meroney.

ED. HOARD'S DAIRYMAN:—I would like to ask J N. Meroney, of Maury Co., Tenn., a few questions in regard to his stave silo. I have been corresponding with a silo manufacturing company, and they ask me $90.30 for a 14×22 ft. silo, and it seems to me that that price is too large, and from what Mr. Meroney says I judge he has built his own silos. What material did he use? Was it matched or beveled? Are his staves spliced and how? How long has he used his silos? Do you consider them just as reliable as a more expensive one? If staves are beveled or put up with square edges, how are they kept in place when they shrink, during the summer? E. S. M.

Lapeer Co., Mich.

When made in the proper manner, experience has proved that the stave silo is thoroughly practical and reliable. The staves can be prevented from falling in when empty and dry by tightening up the hoop nuts, or perhaps, a be ter way, as suggested by John Gould, make the hoops from a section of woven wire fencing which will have sufficient spring in it to hold the staves tight when the silo is dry and empty, and give when the staves swell again.

Building a Stave Silo.

ED. HOARD'S DAIRYMAN:—I'd be tempted to hit a man that offered me a square silo for any other purpose than an ice-house. But I won't argue the case as I am entirely satisfied with my stave one, and will build another before next fall. Here's the bill of articles needed for one, 12×24:

76 staves, 2×6×24 feet at $11 per M	$18.24
7 hoops, 2½×½×38 feet	5.00
7 gripes	3.50
1 bbl Buffalo cement	1.00
Mason, laying cement	75
Carpenter to help put up	2.00
Total	$30.49

The staves were hemlock and can be furnished by any mill-man who has a planer to plane one side and bevel edges.

The iron hoops and gripes or tank fastenings are those used in oil tanks, and both can be had of any hardware company, dealing in oil well supplies.

Here's how to build it complete: Mark out circle two feet larger than you wish silo. Dig down eighteen inches, or one foot anyway, and fill with stone. It takes ten loads for a 14 ft. circle. Sledge them in with stone hammer. Put on two loads gravel to fill all crevices. Mix cement one part, sand and gravel four parts. Spread while thin for a filler. Then mix cement one to two, or if Portland, one to four. Spread not less than an inch thick.

It is better to have a mason lay cement. He will do it so much quicker and nicer.

When cement is dry, draw a circle on it, the size you wish the silo. Then take a stave, and four feet from one end saw it half in two on a two inch bevel, then thirty inches farther saw in again; so on to the end of stave. This is done so you can start your saw in to saw out four thirty-inch doors, four feet apart, when silo is up. Stand up stave, plumb it and stay-lath in place, then stand up another; toe nail top to first stave, tack on a thin board horizontally about two feet up on inside of staves, so on around, toe-nailing top and tacking the board at bottom, until complete.

While putting on hoops, have a man in and outside of silo, driving staves even, with a mallet. Draw hoops up until so tight you can't move them by pulling down on the gripe. Then saw out doors, plane off one-sixteenth of an inch on each edge of door, tack on a strip of bagging all the way round, to make the door air tight, and your silo is complete.

Any person handy with tools can build this style of silo at one-third to one-half the price asked by tank companies.

Will tell in my next how to build the best possible drop, for stable, at the least possible cost. W. H. PRITTIE.

Chaut. Co., N. Y.

Scores and Prizes at Sioux Falls.

ED. HOARD'S DAIRYMAN:—Below I hand you a list of those who participated in the pro rata at Sioux Falls. If you will kindly publish this list, it will show the boys that the money was paid out and who got it. I expected to send out the diplomas this week, but it will be impossible, so I hope the boys will have a little patience and I will try to have them all mailed by the 15th.

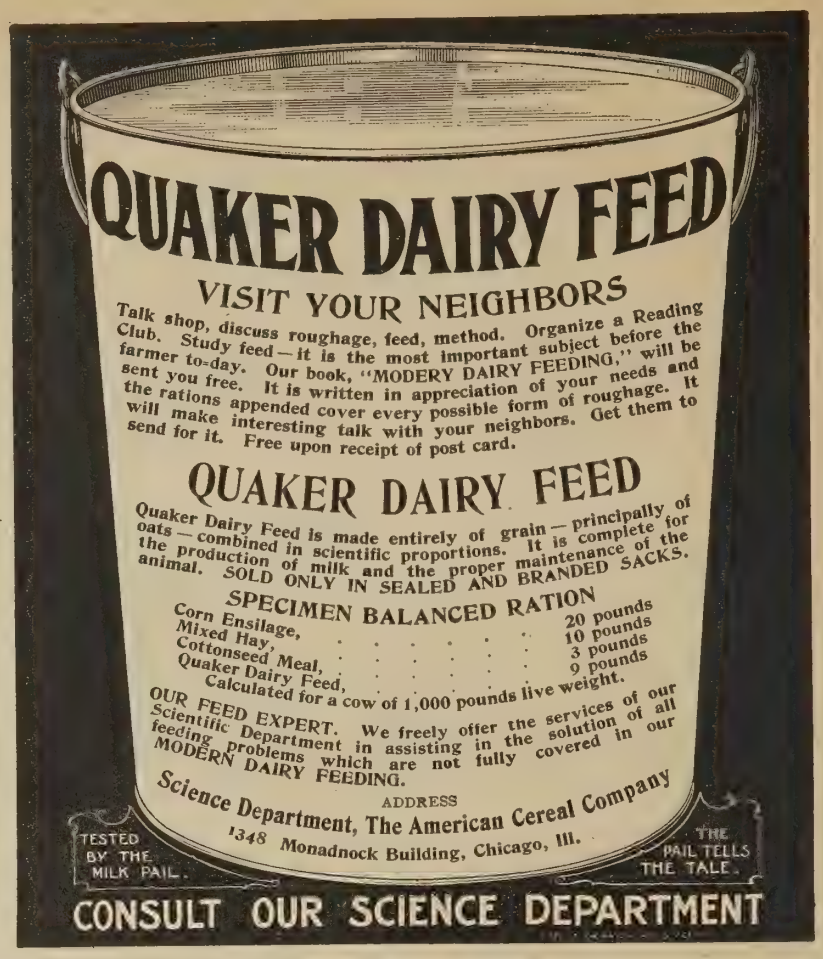
The National Creamery Buttermakers' Association will publish a full report of the meeting just held, in book form, which will be sent to members in good standing only.

Buttermakers and creamerymen, who desire to have this report, and who are not members in good standing, should send in their name with annual dues, $1.00, at once, as only a limited number will be published.

Elgin, Ill. E. SUDENDORF, Sec.

AN ABLE AND EFFICIENT OFFICER.



Concerning the work of enforcing the laws against food adulteration in New York, the *Country Gentleman* has the following to say concerning Mr. Wieting, commissioner of Agriculture of that state:

By the strict enforcement of the agricultural laws, Mr. Wieting has no doubt incurred the animosity of the manufacturers of oleo, of dishonest milkmen, and all other violators; but for the same reason he has won for himself the respect, confidence and support of every conscientious and intelligent farmer.

When he entered upon the duties of his office he found everything in a "topsy-turvy" condition, and at once set about to systematize the work of the department, and place it on a business foundation. By a system of indexing, any information concerning the workings of the department since its creation, official documents, etc., may be had at a moment's notice. It is needless to add, this greatly facilitates the work of the department.

Another wise move on Commissioner Wieting's part was to surround himself with men of recognized ability in their respective lines—men practical in their work—and he has been rewarded in having the agricultural laws enforced as they never were before, and in gaining for the department the name of being second to no other in the United States.

HOARD'S DAIRYMAN congratulates Mr. Wieting on the able administration of his office and the endorsement he receives. The people need a host of just such faithful public servants.

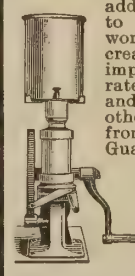
DON'T BUY COTTON SEED MEAL

Unless guaranteed analysis is attached to each bag.

The American Cotton Oil Co.'s

Cotton Seed Meal carries a red tag showing guaranteed analysis to be not less than

Ammonia	8.50%
Nitrogen	7.00%
Protein	43.00%
Crude Fat and Oil	9.00%



See that the name of the American Cotton Oil Co. appears on the red tag.

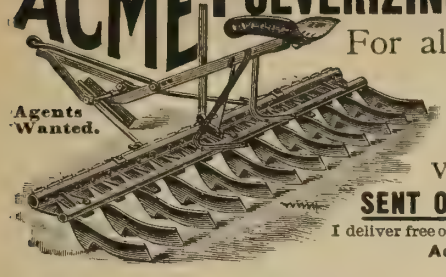
"PLANET JR." CHAPTERS.—No. 7.

Head of the Procession.



You must keep yourself moving if you are going to keep up with the "PLANET JR." Farm and Garden Tools. Every year they do more and better work than the year before. Take the new Two-Row Pivot Wheel Cultivator, that does double work at one passage, saving one man and team; or the wonderful Four-Row Beet Cultivator, one of the greatest labor-savers ever invented. All the "PLANET JR." tools—one-horse, two-horse, and hand—keep you pushing ahead, and making money.

Write for the new 1899 Catalogue, with splendid photographic views of farm scenes all over the world, with the "PLANET JR." Tools at work. It's the most interesting and inspiring implement catalogue ever published. Inquiries for it pile higher and higher daily. Another edition published if necessary. Sent FREE.

It spins on air.
It is a hollow bowl.
It is a simple bowl.
It weighs but 30 pounds.
It skims two tons per hour from .05 to nothing.

This is the first Tubular ever sold and has been running over one year and not a cent for repairs.

FRANKVILLE, ONT.
P. M. SHARPLES,
West Chester, Pa.

Dear Sir:—"Your Tubular Separator, which we are using in our factory, is skimming over 4,000 lbs. of milk per hour, and today we skimmed 6,000 lbs. of milk in eighty-five minutes, and did not leave a trace of fat in the skim milk. The cream produced is the smoothest and finest in quality we have ever seen from any separator. When the separation is completed the bowl can be washed in a few minutes, and it is simply a hollow bowl with no corners or tubes. No other separator compares with it in efficiency, and our large experience leads us to believe it will never have an equal. JONES & RABB."

The "SQUEEZER"

COMBINED CHURN and BUTTER WORKER

Makes possible exhaustive churning at low temperature. It does not grind the butter, but squeezes it, thus avoiding "salvy" butter and always making that of perfect grain. It mixes the salt perfectly and leaves the butter of even color and even texture. It is easy to keep clean, as all parts may be reached easily with a scrub brush. It is

STRONG and DURABLY BUILT

will not break, and requires few or no repairs. Five sizes for creameries, 300 to 700 gals. Three sizes for dairies—50 to 150 gallons.

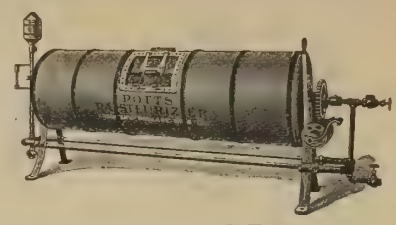
SUCCESS

This is the magic word that marks the limit of every man's aspiration. Men who have and men who will achieve success are those who take advantage of every faculty which the world affords in their particular line.

...The DISBROW



COMBINED CHURN and BUTTER WORKER.

IS ITSELF A SUCCESS,

And will promote the success of every man or institution which uses it.

It will make *more* and *better* butter than any separate machines. Nearly all the premium butter exhibited at fairs and conventions during last year was made in these machines.

There is a growing interest in the subject of pasteurization. We will not attempt to predict how general this process will become. We do know that our . . .

POTT'S PASTEURIZER

Is the Most Satisfactory Machine for This Purpose on the Market.

We have made a number of improvements in it since last season. Cream will rise on milk pasteurized in this machine as readily as when not put through the process.

Write us for full information with prices.

"Ideal" Jar Cup Finish.

In Our MILK DEALERS' SUPPLY DEPARTMENT

Can be found everything necessary for the Dairy or Milk Depot. Try our "IDEAL" Milk Jars and Caps. We know our Jars are stronger, of better shape and color, than any other. Write for our special Milk Dealers' Price Current. Also our little booklet, "Suggestions to the Milk Dealer," FREE.

Printed Pulp Cap.

Alpha De Laval Separators, Ideal Skim Milk Weighers, Elgin Style Ash Tubs, Spruce Australian Butter Boxes, Ideal Turbine Testers, Stearns' Style Spruce Tubs, Ideal Corrosive Sublimate Tablets, Refrigerating Machinery, Ideal Cleansing Powder, Etc., Etc.

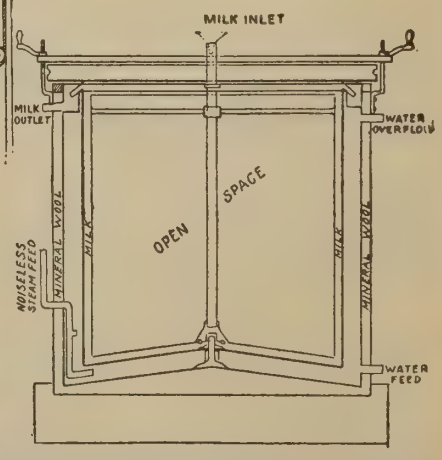
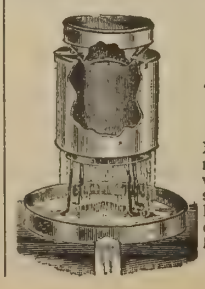
THE DAIRY "VICTOR" Churn.



This Combined Churn and Butter Worker is proving itself to be precisely what the farmers and dairymen have been seeking after. It's work is as complete as the work of the "Factory" Victor Churn, which is rapidly supplanting every other Combined Churn and Butter Worker.



IT IS THE ONLY SUCCESSFUL DAIRY COMBINED CHURN AND BUTTER WORKER ON THE MARKET.

It is easy to handle, easy to clean, perfect in its work, durable and reliable. It charm every farmer and dairyman who sees it work. Manufactured by . . .

F. B. FARGO & CO., Lake Mills, Wis.

The YOUNG AERATOR And Cooler

Needs no water or ice, removes all odors and gases, warranted to keep milk sweet from 6 to 12 hours longer than any machine on the market or money refunded. Circulars free,

W. H. YOUNG,
Box 135, Aurora, Ill.

THAT COWY ODOR

so noticeable in all milk and butter in the winter time can be removed entirely by the use of the

PERFECTION MILK COOLER AND AERATOR.

It takes out all stable odors and all odors arising from feeding turnips, cabbage, roots, ensilage, &c. It quickly pays for itself in the improved quality of the product of the dairy. Send for FREE circulars and prices to

Reading notices, 50 cents per line (nonpariel measure) each insertion.

Near Menominee, Mich., in what was a dense wilderness a few years ago Hon. S. M. Stephenson has established one of the most promising dairy farms in the land. One hundred and twenty-five cows are milked and the buildings are all of a strictly first-class character. The central barn is a mammoth affair with cement floors, pure running water for every animal, electric lights and an immense silo.

TIRED OF IT.

The Denver, Colorado, *Times* well says:

"The people are tired of being imposed upon with bogus butter. They are tired of the principle that permits its sale in the towns and cities of the state."

That is a sentiment from the consumer's side of the question.

It is truly sickening to consider the fraud and adulteration there is in food; the corruption and wholesale debauchery there is in politics, and the low state of morals among the people that will excuse either, if it brings them a momentary advantage.

WASTE.

Edward Atkinson makes a very sharp, keen remark when, in writing about the fearful waste of both skim milk and corn stalks, he says in effect that he does not know much about farming, but when he sees this waste going on all because of the ignorance of men, he has a right to conclude that the average farmer himself really knows but little of farming. Little as Mr. Atkinson knows, he knows enough to see this big waste, whereas he talks with lots of farmers who don't know it, nor can they see it. Pope says something about familiarity breeding contempt. Is that not the secret of this matter? So many farmers have for so long a time been accustomed to this wasteful way of handling corn stalks and skim milk, that they really cannot see the wastefullness of it. But, Mr. Atkinson is right, clear away right, when he speaks of this fearful waste. Let it be remembered always that 40 per cent of the combined value of the corn plant is in the stalk.

Let every farmer take that fact as his guide and then so shape his farm methods, feeding methods and all methods, so as to save all of that waste possible.

Let him also remember that 40% has been once earned by his own expenditure for labor, and he must pay for the growing of it. If he wastes 40% of what he earns the responsibility rests on him and not on Providence.

A full study and consideration of that fact will be enough to lead any man out into better and more saving methods if he will but follow its teachings.

We present this week two typical examples of the dairy form. The *Breeders' Gazette*, which poses as an authority on both beef and butter and consequently frequently mixes the two, would call them "screw ended" and refuse them a place in the prize ring, because they do not conform to a set of antiquated rules.

It is fortunate, however, that owners judge their animals more by their performance than by rules, and consequently we find prize animals breaking rules in all directions. The *Gazette* would have Countess Matilda's back straight where there is a hump; her thigh "blocky" where it is incurving; and beef where she is thin. But she goes on her bovine way, breaking rules and holding a record of 19 pounds, 10 ounces of butter per week. Wherefore her picture is given in the Dairyman this week.

King Exile of Allendale belongs to the same dairy type. The points which the Dairyman has so often pointed out, we find here well represented.

Experience with Abortion.

Ed. Hoard's Dairyman:—I notice in the Dairyman of December 9th, that O. H. L., of North Calais, Vermont, writes about some after effects of abortion. I had the disease in my herd for nearly two years, and had four cows that had the same lameness that he speaks of; I wrote to the Dairyman about it, and you said that the cause of it was about my own place somewhere, but I could not find it.

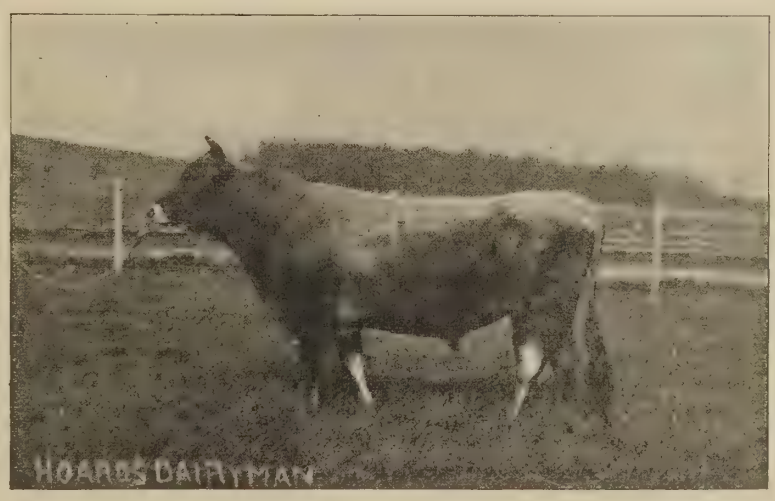
I have a brother-in-law who is a veterinary surgeon, and one day when he was at my place, we went to the barn to try and locate the trouble, (because he said the same thing that you did about it); after looking all over the place and finding nothing, he said to me: "Is there any hollow place under your barn where the water could lie?" I said, "I think there is a hollow place, but the land is so light and porous that the water would not lie there", but he said that the liquid manure would make the soil so close and hard that it would hold the water just like a basin.

The next day I tore up my stable floor and found a pool of water about six feet across, and from one to six inches deep; it was as black as molasses and almost as thick; I at once laid a four inch tile drain from that low place clear across the yard, so that any water that may run under the barn must run away at once, and I have never had a lame cow since, or one with a bunch on her leg.

My cows were affected just as his are; that was fifteen months ago; the cows that were affected stood over the water or near it.

I do not want your readers to think that I let the liquid manure run through the stable floor and then run off and waste; I have read the Dairyman too long to do that now. About four years ago I built an addition to my barn, and the hollow place was where there had been a manure heap at the end of the old barn.

The first cow that I had that was affected with that lameness, lost the use of all her legs and finally died; (the only animal of the cattle kind that I have lost since I commence farming,) which was 26 years ago. Only one of the cows that was affected with the lameness ever got entirely over it; the others were lame so long that I fattened them and sold them.



I had abortion in my herd for two and one-half years, and all the cows that were lame had aborted, except one; I have not had any cases of abortion within the last six months. I will tell you about my fight with that disease later. R. McF.

LOW, UNPROFITABLE STANDARDS.

The Nebraska *Farmer* scores the patrons of creameries in that state who are so contented to sit down with a poor, unfit cow, and try to do a dairy business with her. The creameries, it says, are trying to work out their part of the problem nobly, but the farmers wallow in the mud of poor results, and don't seem to want any better cow than they now have. The *Farmer* takes the Schuyler creamery as an example. The facts analyze as follows:

"The various stations furnishing milk for the Schuyler creamery have a total of 89 patrons. Each patron receives on an average $12.52 for his milk product for a month, on the same basis $148.24 for the year. Assuming that each patron made one trip per day to the station, he received the beggarly sum of 42 cents per trip, and has been at the trouble of patronizing a creamery, and all the detail of keeping milch cows for a miserable product of 64 pounds of milk per day—a product which ought to be turned out by not to exceed three cows!"

In commenting on this low state of dairy knowledge and dairy results, a writer well says:

"This analysis of the dairy conditions under which the Schuyler creamery is working shows that with all but possibly an exceptional person, here and there, the dairy gospel has not been promulgated in the vicinity of Schuyler. Doubtless, one could find ten farmers in that community, working with all their energy to produce hog fat, worth 2¾ cents per pound, instead of butter fat, worth 17 cents per pound—forgetting that the surest way to get the hog fat is to run the pig industry as an accessory to a first-class dairy.

"A man with dairy sense, living in the neighborhood of the Schuyler creamery, on a 160-acre farm, can keep 30 cows in milk the year through. Each cow will produce 6,000 pounds of average milk. At the average butter fat content of 3¾% each cow should produce 225 pounds of butter fat. This, at an average of 13 cents per pound for the year (not 17 cents the September price) would be worth $29.25 per cow. The by-product of such dairy farm in pigs and calves would amount to $400 per year, making a total of $1,277.50.

"This estimate of the income from a dairy farm, accessible to a well managed creamery, is a commonplace yield that any farmer can reach. There are plenty of dairy farmers who are good managers, who would make an increased butter yield and extensive side products nearly double the estimated income given here. But this proposition in any form involves making dairying a business. The man or woman who will "go through the motions" of patronizing a creamery, or any kind of dairying, with a product worth only 42 cents per day, must have a small estimate of the opportunities a farm affords for business enterprise."

The reason these Schuyler patrons and thousands more like them are where they are is that they will not read up and grade up their own minds on this dairy question. Men cannot put ignorance in place of intelligence in the dairy business, and get profit out of it. As well think of sowing thistles and reaping wheat. It is simply a lack of dairy intelligence. Lack of dairy intelligence produces just such results down east in New York, or out in Nebraska, or here in Wisconsin. No matter where you see that kind of a man, or take a look at his cows, his farm or his milk receipts at the creamery, one can tell where he belongs, and just what ails him.

Forty restaurant and boarding-house keepers in Manchester, N. H., have been indicted for violation of oleomargarine laws.

TO THE MEN WHO DON'T TAKE HOARD'S DAIRYMAN.

Mr. J. Moldenhawer, of Washington, D. C., is a highly skilled dairyman. He is engaged in producing the finest of milk for the highest paying demand. Mr. J. C. Jurgensen, of Brooklyn, N. Y., in writing to us in the issue of Sept. 23, concerning a visit he paid Mr. Moldenhawer, says:

"Mr. Moldenhawer is himself picking out Hoard's Dairyman before any other of the many farm papers he keeps, and he frankly says that your great paper is of high value to him. When a man with his reputation says so, how can the farmers who expect to make money by keeping cows for dairying, get along without the Dairyman. Still it is a very trying job to try to convince farmers how much it would help them to keep an extra good dairy paper."

What is the lesson that the above teaches? This: That no man who is keeping cows for profit can afford NOT to have such a friend and adviser as Hoard's Dairyman at his elbow every day in the year. Simply put a dollar bill in a letter with your name, post office, county and state plainly written on a piece of paper, and mail it to us, and secure the paper to Jan. 1, 1900.

THE oleo men never tire of telling how the people want their compound in preference to butter and a lot of Metropolitan newspapers echo the cry. All this talk is but a part of the general fraud and deceit which characterizes the oleo trade.

Here is an incident in Connecticut which illustrates the oleomargarine trade all over the country.

The other day, Dairy Commissioner Noble and Deputy Eaton went fishing after an oleo seller in Waterbury. In front of the grocery store stood a load of what appeared to be butter.

Mr. Noble stood outside to watch the team while Mr. Eaton went inside. A clerk stood by a tub of butter turned down in the usual way and was in the act of selling a pound of the stuff, at 25 cents a pound, to a woman who was in the store. As soon as the clerk saw Mr. Eaton he grabbed the tub of oleo and ran from the store, closely pursued by Mr. Eaton. He ran down an alleyway and into a livery stable, where the groceryman, whose name was McEvoy, kept his team and tried to have the keeper shut the door on the deputy. Mr. Noble had followed in the chase, Mr. McEvoy was found and all went back to the store. Here, McEvoy got counsel, pleaded guilty and without any formal trial paid $100 and costs, the maximum fine. The United States label had been torn from the tub and the store was selling the oleo as butter.

THE WISCONSIN CONVENTION.

THE Wisconsin Dairymen's Association held its 27th annual convention at Green Bay last week. The attendance was very good indeed, although not as large as was expected. This was due, in a large part, at least, if not wholly, to the excessive cold weather of the previous week which compelled a practical suspension of all work except the care of stock, and left an accumulation of other matters requiring attention.

Every indication prior to the first day of February was for one of the largest conventions in the history of the society and there can be little doubt that only the unseasonable weather, as above indicated, is responsible for the moderate attendance. As it was, every session was so well attended that neither the officers nor the speakers could complain for want of an appreciative audience. Every paper and address on the long program, including even the only half-promised address by Mr. H. E. Cook, of New York, (except one of the general addresses for Wednesday evening) was presented and called forth spirited discussion and there was occassional regret that there was not more time for these questions and answers.

The interest increased from start to finish so that, notwithstanding the meeting continued for three days, the unanimous verdict was that in point of attendance as well as interest, Friday afternoon's session was equal to any that preceded it. The intimate personal relations of the editors of the DAIRYMAN with the management and conduct of the convention forbid that extended comment which would otherwise be appropriate, and they consequently leave for others to apportion commendation or adverse criticism.

The secretary under instructions from the executive board and with their active co-operation, endeavored to present a program which should deal largely with the foundation principles of successful dairying. The technical details of creamery and cheese factory management were almost wholly relegated to the younger associations of butter makers and cheese makers and the dairy schools. Farm butter making, soil fertility, the necessity and utility of keeping records of each cow's product, the claims of the cow as a mother and foster mother, a silo census and resume of silo experience in a community where they have been used for several years, the value of skim milk, a review of the cheese industry in Wisconsin for the past year, barn building, sub-earth duct construction, the Wisconsin curd test, (for detecting impure and tainted milk), dairy observations covering the country from the lakes to the gulf and from ocean to ocean, women in the creamery, the relations of patron and cheese maker (Mr. Cook's address), and lessons learned from thirty years' experience making butter on the farm, were the subjects brought forward.

It goes without saying that practically every paper contained some reference to the specific, special purpose *dairy* cow, her feed and care, and the best means for increasing her efficiency as a producer of milk, butter and cheese, and it is confidently expected that the published report will prove of unusual interest and value. An effort will be made to get this report printed and distributed earlier than usual, but as this is a matter resting in the convenience of the state printer, specific promises in this respect cannot be given.

Following are the resolutions adopted:

Resolved, That this Association tenders its sincere thanks to the citizens of Green Bay for the gracious hospitality with which we have been greeted and supported in this most interesting convention.

Resolved, That the thanks of this Association are due and are hereby tendered to the several railroads of the state for the considerate tender of reduction of fare to all persons attending this annual convention.

Resolved, That we are much gratified that the new State Board of Agriculture of Wisconsin has recognized the dairy industry of the state with becoming liberality in premiums and intelligent comprehension of its importance.

Resolved, That we take pleasure in placing upon record our grateful appreciation of the courtesy of the Secretary of Agriculture of the United States, Hon. James Wilson, of Iowa, and his efficient chief of the Dairy Division, Major H. E. Alvord, in sending several packages of foreign made butter to be exhibited at this convention, so that comparisons could be instituted with that made in our own creameries and dairies. The exhibit was a constant center of attraction.

Resolved, Further, that we commend, without reserve, the continued intelligent effort put forth by the Secretary and the Dairy Division to bring the attention of the consumers of dairy products in Europe to the unquestionable merit of the better classes of butter and cheese made in this country, and especially do we approve his recommendation to Congress to provide for an official inspection and certification of exported dairy products.

Resolved, That the bill introduced by Hon. J. H. Davidson, of this state, and now pending in Congress, which provides for placing an internal revenue tax of 10 cents per pound upon oleomargarine or other similar compounds which are made in imitation of yellow butter should have the active support of all persons interested in the production or consumption of legitimate dairy products. The members of this association, individually and collectively, pledge their active and most vigorous support to the Davidson bill, until that measure shall become a law.

Resolved, That we commend the Dairy and Food Commissioner of Wisconsin for his efficient and faithful services in the execution of the laws of this state relative to the manufacture and sale of adultered and spurious food products. We fully indorse the commendations made in this behalf by the President of this Association in his annual address. It is not alone the dairymen, but every other citizen of the state as well is vitally interested in pure food legislation and its enforcement When an officer charged with such duties as devolve upon a Dairy and Food Commissioner has proven himself both efficient and faithful, we insist that every consideration of common prudence and sound public policy demands his retention in office.

Resolved, That we endorse and urge the passage of the bill now pending in the Wisconsin Legislature providing for an appropriation to the Wisconsin Cheese Makers' Association, and also for the printing of their annual report.

Resolved, That we urge the legislature now assembled at Madison to provide liberally for the Wisconsin Dairy school, so that it may accommodate more pupils and give instruction in additional lines of dairying.

Resolved, That renovated butter (which is old rancid and decaying butter that has been melted, churned over, resalted and recolored in semblance of fresh butter) is a product deceptive in character, inferior in quality and is of such a nature that its sale is dependent on deception. It is the emphatic judgment of this Association that the legislature now in session should pass a law providing that the manufacture and sale of renovated butter shall be regulated in such a manner as to advise the purchaser of its real character.

Resolved, That the Wisconsin Dairymen's Association most earnestly endorses the work which has been and is now being done by the National Dairy Union in its efforts to promote just laws in the National Congress and the several states for the protection of consumers and producers of honest dairy products. We therefore most heartily recommend the Union to the generous support of the dairymen of the state.

THE EXHIBITS AND SCORES AT THE GREEN BAY CONVENTION.

The Executive Board decided to withhold the butter scores made at the late dairymen's convention. The total number of exhibits was less than expected and the average score several points lower than usual, although from three to five points better than that obtained in other states, this winter. Daniel Bleuer, of Omro, won the sweekstakes with a score of 96 points and was closely followed by Messrs. Wiggington, of Hustler, and Hermanson, of Scandinavia.

The reasons for this lower average are not far to seek. Nearly all the butter exhibited was made during the preceding cold week, making it necessary to keep the cows constantly confined in the stables, very few of which are provided with any means of ventilation whatever; the delivery of milk to the creameries, for the same reason, was exceptionally irregular, and the detection of off-flavored milk doubly difficult; few, if any, creameries or dairies are provided with means for maintaining a uniform or proper temperature with the mercury ranging continuously from zero to thirty degrees below, for a week or more.

The judging was of the highest and most exacting quality, as it always should be, for these exhibits are as much for instruction as for winning prize money. The judge, on this occasion, Mr. S. Edward Davis, is the official scorer for the Chicago Butter Board and there can be no question as to his integrity or ability. Score cards will be sent to every exhibitor and these will disclose to each one exactly where the sample of butter exhibited was found deficient. If accepted for what they are, as candid and discriminating criticisms, they will be instructive in the highest degree.

The cheese exhibited proved to be of excellent quality, as the following scores show:

EXHIBITOR.	Flavor.	Texture and sock.	Color.	Finish.	Total.

Permanent Pastures.—Feed and Volume of Cream.

ED. HOARD'S DAIRYMAN:—I differ with you on your advice to the lady from Topeka, Kansas, on making permanent pasture. My experience and that of my neighbors is that when we sow oats with clover and alfalfa and let the oats get ripe, it robs the young grass or clover seedlings of so much moisture that they usually perish after the grain is cut. It may not be the case with you in Wisconsin, but our light, western soils are very dry just after harvest and seldom have enough rain at that time of the year to do any good, and I suppose Kansas is in about the same fix.

Last spring I put in ten acres of alfalfa and sowed one bushel of oats to the acre. I cut it with a mower, just when it was in the dough state, for hay. Had a light rain after it was cut, but still half of my alfalfa plants are dead. Two acres I sowed at the same time in calf pasture, with one bushel of oats and one of rye per acre; turned in eight calves after oats were one foot high; left them there all summer and now have a fine stand of clover and alfalfa. So after this, I will pasture my new seedings in place of raising a nurse crop for hay or grain.

Last spring, when pasturing on winter rye, my cows gave several gallons more milk per day than they had been giving on dry feed, and my cream came out of the separator one-third or more on this green feed than I had been getting on dry feed. Oil test at creamery ran down to 7 to 10 where it had been testing 12 to 13 on dry feed. After rye was all gone, I fed some hay and grain, as my pasture did not furnish quite enough green feed, then I got less cream in proportion to milk, but my test went up to 11 and 12 again. Now I have had the same thing happen a week or so ago. I had been feeding oat hay, all the cows would eat; four pounds cob meal and six pounds bran per day, and oat straw and corn stalks in field during the day. I changed off to early cut millet hay in place of the oat hay and I was surprised to see my separator get a spell again. Now I feed three pounds bran and seven to eight pounds corn and cob meal, and my cream is all right again, three gallons milk to make one inch cream; has the corn meal offset the slushy hay and made a change in the milk, or what can be the trouble? If you can answer this you will greatly oblige me.

On millet I got 11 pounds cream out of 40 pounds milk at one of my milkings, when I weighed before and after separating. I use a safety hand machine.

Wash. Co., Neb. H. G.

Yours is merely another illustration of the readiness of a cow to respond to changes in surroundings and feed. On changing from dry to green feed, cows will frequently show an increased yield of milk and a variation in the amount of cream. Slight physical changes in the milk (an increase or decrease in the viscosity) will frequently show marked changes in the quantity and quality of the cream layer; and of course as the volume of

A GRAND INCREASE.

We know as well as can be known, that HOARD'S DAIRYMAN is a most valuable friend and counsellor to any man who has to do with the Dairy Business.

We know thousands upon thousands of men have made money by following its advice in hundreds of ways.

We are having a "Grand Increase" this year, mainly through old and valued subscribers, who urge their neighbors to subscribe.

This paper is intensely practical. It is after practical results. It strives to lead men up out of costly, wasteful ways of dairying. The old subscriber realizes its value.

The man who is out of the fold ought to be benfietted as well.

SEND $1.00 AND TRY IT FOR ONE YEAR.

cream varies, the per cent of fat in the cream will undergo a corresponding change.

Brine Salting of Butter.

ED. HOARD'S DAIRYMAN:—I would like to hear from buttermakers who practice brine salting. How much salt they use, how they get it thoroughly incorporated with the butter, what temperature they work butter at, and everything that would interest a buttermaker? Also why is it that the overrun by Babcock test is less in winter than summer, when separator is skimming equally clean? Would like to hear this discussed fully.

Grove City, Pa. B. H A.

A Pennsylvania Herd Record.

Three Hundred and Fifty Pounds of Butter per Cow.

ED. HOARD'S DAIRYMAN:—During the year ending December 31, 1898, our herd of Jerseys averaged five thousand, eight hundred and eighty-four and thirty-six one hundreds pounds of milk, from which we made an average of three hundred and fifty and three-fourths pounds of butter. No account was kept of the new milk fed to calves and used in the family. AUSTIN LEONARD.

Bradford Co., Pa.

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name, Post-office and state of writer. Condense the questions into plain specific inquiry. Be careful to note if your questions have not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

RECLAIMING LOW CLAY LAND.

I have a lease upon a piece of ground that is a heavy clay and lays very level, no chance to drain the same. The water lies so long upon it in the spring that when it dries up it cracks open. I would like to know if anything can be done so I could grow something for the cows to eat. If you do not know, perhaps some of your subscribers do.

Payson, Utah. R. L. C.

We have known sink holes of this description, covering sometimes an acre or more of ground, reclaimed by sinking a well or pipe down through the clay to the porous soil beneath. Whether such a plan would work with our correspondent, or if it would, whether as a lessee he could afford the expense are problems we cannot solve. Possibly some of our readers can give further information.

DELIVERING MILK AND CREAM.

We have a creamery in our locality; most of the patrons deliver milk; we also have a few that deliver separator cream.

What per cent more would you allow the patrons that deliver cream, or in other words, what per cent is lost in skimming? What is the per cent of churn increase over the Babcock test? Please explain fully as we want to give each patron his just dues. E. S.

Millpoint, N. Y.

In receiving either milk or cream at a factory, credit should be given for exactly the amount of butter fat delivered by each patron; whether in the form of milk or cream.

You need not bother with the loss in skimming if you will use the Babcock test on the cream. There is no trouble in doing this if you will supply the creamery with the right apparatus, and then see that the testing is performed in a proper manner.

The *average* per cent of over run is 15 per cent, but it may vary a per cent or so either way from the average; as we have frequently stated in the DAIRYMAN, the most equitable method of pro rating is to weigh the butter and divide the proceeds according to the amount of fat delivered by each patron. In this way all calculations as to the over run or loss in churn and separator are obviated; although it does not prevent the necessity of care in preventing such openings for waste.

COWS, FEED AND SEPARATORS.

I thought I would write you about my cows and see what you think about it for a beginnning, or if you think I had better stop. We will start with two cows, No. 1 and 2, that were fresh some time in the fall of '97. No. 1 milked on until the middle of September '98; No. 2 milked until the middle of Nov. '98. No. 1 was seven years old and No. 2 was four years old.

The next that came in was a fourteen months old heifer, the middle of February, and gave about two gallons of milk per day most of the time up till fall and we quit milking her the first of December.

Next was a two-year-old heifer No. 4, that came in first of March and milked until the 15th of December. No. 5 came in first of May and we milked her till first of December.

I have sold, from January 1, 1898, to December 31, 1898, from these five cows, 1182 lbs. of butter, at 18 cents per pound, besides what my family have used, and there are six of us in the family, and have raised four nice heifer calves with the skimmed milk.

One of the calves will be fresh in April. What no you think about their being fresh at fourteen months old?

My feed is corn and cob meal at $18 per ton, and wheat bran at $18 per ton, mixed in equal parts, add pea vine hay and corn stover. Could you better the feed out of the above?

Do you think a separator would pay me? Will have eight cows to milk this year. Have been reading the DAIRYMAN for the last year. My cows are all high grade Jerseys. J. M. POWELL.

N. C.

You are evidently on the right road; careful feeding and testing, with a sharp eye for the sort of feeds used, will carry a man far on the road to success in the dairy.

Corn and cob meal and bran at $18 per ton, each, are too expensive to make up the entire grain ration when cotton seed meal can be had at much cheaper rate proportionally for the digestible nutrients.

Feed not to exceed three pounds of cotton seed meal per day and reduce the bran and corn and cob meal proportionally.

Fourteen months is much too early for a heifer to freshen. Twenty months would be much better and if you want your animals to have strong and vigorous calves, twenty-four months is better still. If you wish to obtain all there is in the milk, get a separator; certainly you will soon make up the price on the amount of fat saved, besides less labor and a better quality of skim milk for feeding.

WHAT IS MIXED FEED, ETC.?

Will you give me a balanced ration from the following? I feed in the morning early cut hay, clover mixed, at noon corn stover, and at night meadow or low land hay. I now feed 4 quarts mixed feed, 2 quarts cob meal, and 1½ quarts gluten (cream).

Mixed feed is selling for $16.50, cream gluten for $22, and can buy cotton seed meal for $23. My cows are small cows, grade Guernseys and Jerseys, with one grade Ayrshire. A. W.

Mass.

Why may not we sometimes turn interrogator? What is mixed feed? What is meant above by cob meal? What is early cut hay clover mixed? And what is low land hay?

We have not asked these questions with any purpose to reflect upon A. W., but simply to illustrate how difficult it is to write so that others may fully understand you. We quite often find ourselves skipping along too hurriedly. The thought is explicit enough to us, because we have all the conditions and exceptions before us; but the reader finds fatal gaps and omissions. May we not claim charity for these short comings on the plea that they result from a weakness to which all of us are more or less subject.

While we cannot predicate a formula on the information given above, we suggest to A. W. that the grain part of the ration seems to us about right as to weight. For cows fresh, or nearly so, the grain should not be less than one pound for each 100 lbs. of live weight in the animal, and the 7½ quarts, above specified, will probably weigh not far from 8 pounds. If under this feeding the cows are not gaining in weight, he may be sure he is not feeding too much, because no part of the feed is being turned into an unprofitable channel. Under these conditions, it would be well to increase the amount, a little at a time, and note the result. The extra feed will make itself apparent very soon, either in an increased yield of milk, or in an increase of live weight. If the former, it will probably be economical to continue the increased allowance; if the latter, no profit will ensue, unless the cows are now too low in flesh.

We consider that the cream gluten is now up to the maximum; hence the increase should be in the mixed feed or the corn and cob meal, or by adding some cotton seed meal. We should favor trying the latter; at first by adding say, one-half a pound to the daily allowance. If this proves encouraging after a few days, add a second half pound, and so on, as long as the increased flow of milk pays for the increase in cost of feed. Let there be a little salt every day.

THREE MISSOURI QUERIES.

Please answer the following through your columns:

1. Is skim milk worth 3 cents per gallon, for pigs?

2. Which is the most economical to be fed with corn and cob meal, bran $12 per ton, malt sprouts $9 per ton, brewers' grains dried, $10 per ton?

What is the most comfortable and cleanly stall for cows? Give directions.

Palmyra, Mo. G. V. S.

1. A gallon of skim milk will weigh approximately nine pounds—certainly not more, and only in very exceptional cases and for special purposes would it be worth the price named. At present prices for pork, it is estimated at about 15 cents per hundred pounds, or say 1½ cents per gallon.

2. The dried grains are somewhat cheaper than bran at the prices named, but they need to be well soaked before feeding, and this entails quite a good deal of extra labor. The malt sprouts, if of good quality, are also cheaper, but there is a limit (three to four pounds per day) to the amount of them that can be profitably used. Probably a combination of the three kinds of feed would give the best satisfaction.

3. There are many diverse opinions on this subject. We have illustrated many forms of stalls, and it is but fair to say that each has some distinctive merit, and possibly none entirely perfect. The "Scott" stall given in this issue, as will be seen, has at least one earnest advocate. Various modifications of this could be suggested, such as extending the partitions back to the gutter, making them either rigid or swinging, and putting a chain or rope across at the rear, and thus dispensing with the necessity for a tie.

LARGE COWS. LARGE YIELDS. LARGE RATION.

I have been a constant reader of your valuable paper for, I think, 5 years, and could not carry on a dairy without it.

Kindly advise me as to change you would suggest in the following ration. Cows fresh, giving 40 to 46 pounds daily, weight about 1,350 to 1,450 pounds.

Corn ensilage not very well eared, bran $14.50, gluten feed $16 per ton; ensilage 35 pounds, bran 7 or 8 pounds, gluten feed 5 pounds. All the clover hay they would eat up clean.

I desire large flow of milk at smallest cost. Sell milk. Would it be safe to feed 6 or 7 pounds gluten feed per day? C. D. A.

Howell, Mich.

We may say, in the first place, that we should not apprehend any danger from increasing the allowance of gluten feed to seven pounds per day, but at the same time we cannot see any necessity for doing so. The ration as now arranged carries an excess of protein, as the following figures show:

	Dry Matter.	Digestible Nutrients Protein.	Carbohydrates	Ether Extract
35 lbs. silage	7.32	.32	3.95	.25
10 lbs. clover hay	8.47	.68	3.58	.17
7 lbs bran	6.17	.88	2.70	.21
5 lbs gluten feed	4.61	1 42	3.39	.15
Totals	26.57	3 30	13.62	.78

Of course, these large cows, giving a liberal quantity of milk, must have a large ration, and we would rather increase than decrease the total amount. To that end we would substitute some corn meal for a part of the bran and gluten—say 2 pounds each—and then feed the grain with the silage. Do not make this radical change all at once, but take several days to bring it about. We are not at all certain that a change of this character will increase the flow of milk, or be otherwise profitable, but it might be tried with a part of the herd, and let the results govern future practice.

A PENNSYLVANIA RATION.

Please make a ration out of the following: Bran, $16 per ton; buckwheat middlings, $16; oil meal, $26, and corn and cob meal worth 20 cents a single bushel; clover and timothy hay mixed, corn stover and wheat straw. Also have some buckwheat, worth 35 cents, which I can get chopped. Would you advise feeding oil meal at price quoted, where neither ensilage nor roots are fed?

Pa J. P.

Corn and cob meal should weigh 44 lbs. to the bushel. If the other feeds produced a condition bordering on constipation, enough oil meal should be fed to overcome it. Otherwise it will not be needed.

FORMULA FOR RATION:	Dry Matter.	Digestible Nutrients Protein.	Carbohydrates	Ether Extract
12 lbs. mixed hay	10.30	.58	4.75	.19
10 lbs stover	5.95	.17	3.24	.07
4 lbs. corn & cob meal	3.56	.26	2.52	.14
4 lbs. buckwheat middlings	3.49	.88	1.34	.22
3 lbs. bran	2.64	.38	1.16	.09
Totals	25.94	2.27	13.01	.71

Straw may be added in such amounts as the cows will eat, or substituted in part for the stover. The buckwheat is worth more to sell than to feed.

CREAMERY AND CHURN TEST.

There has recently been a creamery started here, where whole milk is delivered to creamery, tested and separated, and so much per pound paid for the butter fat obtained. A number of the patrons complain that their

test per cent, of butter fat, is not high enough. One customer, in particular, gets a test of 5% butter fat, while he has churned seven pounds of well worked butter from 100 pounds of milk, from the same cows and since his first test was made. What is the trouble? Are we, or are we not getting a fair test? A. P. R.

Mills Co., Ia.

Your letter contains but little data upon which to form an opinion. We would call attention to the fact that the phrase "well worked butter" is a very elastic term, and that a man who is comparing a churning with the test is sorely tempted, when it comes to the working of the butter. Seven pounds of well worked, marketable butter per hundred pounds of milk, would correspond to nearly 6% milk, which is exceedingly high for a herd, unless most of them are strippers. You do not say how often tests are taken, nor in what way. Samples should be taken every day, and tests made three times a week. Unless the cows are advanced in lactation, we would consider 5% an exceedingly good test.

BEGGAR WEED HAY.

I send you by to-day's mail a sample of hay called 'Giant Beggar weed." It grows well in this section of the county, and can be cut two or three times a year. Both cows and horses are very fond of it, while growing and in hay. Please let me know through the columns of your valuable paper what you think of it as a cow feed. J. H. P.

St. Francisville, La.

Beggar Weed, *Desmodium molle* is a plant belonging to the same family as the pea and clover. Very favorable reports have been received from the Gulf States regarding its use as a forage plant. It has to be seeded annually, will not stand much grazing, is a good fertilizer and not affected by drouth. It is best adapted to light sandy land, makes sweet nutritious hay readily eaten by stock. The analysis shows it to contain 17% of protein, showing it to be of equal value with clover, alfalfa and cow pea. Evidently a very valuable fodder plant for the Gulf States.

MOLDY ENSILAGE.

I did not get my stave silo finished in time and my corn was too ripe. Kept water running on while filling, have fed about half of it with what I have thrown out. It has been a dry mold all around the side and hangs together like fire fanged manure. It gets worse as I go down, extending to the middle. Would it do any good to put water in the silo if it gets much worse?

Townville, Pa. W. N. K.

If the silage is as bad as your letter would indicate it is too late to help matters, as the mischief is done. Besides which, spoilt or molded silage should not be fed, you run a greater chance of loss by sickness in animals so fed than you would gain by using up the spoilt feed.

A MICHIGAN CONDITION.

I have got along without your valuable paper as long as I can. Enclosed you will find $1 for subscription.

We are milking forty cows, mostly Jerseys. Weight about 1,000 pounds and have some Short-horns that weigh from 1,200 to 1,400 pounds.

I would like a balanced ration from the following feeds: Good corn ensilage, corn stover, all cut and in fine shape, cost $1.50 per ton, good clover hay at $5 per ton, Chicago gluten feed at $15 per ton, wheat bran at $14, corn meal $14, wheat middlings $12 50 per ton Ensilage and stover on hand. Balance of feed bought.

Ionia, Mich. A. M. W.

Of course we are very glad to welcome A. M. W. back into good company. It is one of the disheartening things connected with the publication of a paper like the DAIRYMAN to have subscribers fall out when their subscriptions expire. Probably there is as little of that with us as with any of our contemporaries, and hitherto the places thus made vacant have been filled at the rate of about two to one. While we welcome the new comers, it saddens us to part with old friends, and we wonder, as we see the names taken off the list, whether they have found the paper disappointing, and if so, in what particulars. Of course, we cannot expect to please everybody, but we try as much as in us lies to make a paper that everybody can make profitable. It is somewhat singular, but it is a fact amply attested by our subscription books that it is not the prosperous dairymen who fail to renew year after year. We are therefore persuaded that those who do find the DAIRYMAN disappointing are very largely of the class who for one reason or another condemn its teachings without putting them to the only effectual test of a thorough trial. If there are any such who chance to read this item, we beg of them, to put aside prejudice and inherited opinions and give the suggestions we offer, as far as they may be applicable to them, a fair trial.

We suggest to A. M. W. the following for trial:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
25 lbs. silage	6.60	.33	3.50	.18
10 lbs. stover	5.95	.17	3.24	.07
5 lbs. clover hay	4.23	.34	1.79	.09
3 lbs. bran	2.64	.38	1.16	09
5 lbs. gluten feed	4.61	1.02	2.42	.15
Totals	24.03	2.24	12.11	.58

Add to the above with each cow, more clover hay, up to the limit of her appetite.

MAKING UP MILK IN THE CHEESE FACTORY.

We want a cheese maker. We are a stock company; will have about 400,000 pounds of milk next season. State how you would make by the hundred or by the month. T. B. R.

Roberts, Minn.

You can get a cheesemaker very easily by putting a want ad. in the columns of the DAIRYMAN. We should make neither by the month nor hundred, but by the amount of cheese actually made, and then divide the proceeds according to the amount of butter fat delivered to the factory by each patron.

AN ILLINOIS RATION.

With clover hay $4.00, corn stover, no salable value, ear corn $7.00, oats $15.61, bran and middlings $13.00, how shall I feed my cows for most profit? My milk goes to a condensing factory, and I am prohibited from feeding oil meal and silage.

Illinois. SUBSCRIBER.

Try the following for an average:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
15 lbs. clover hay	12.70	1.02	5.37	.26
8 lbs. corn stover	4.40	.14	2.59	.06
6 lbs. bran	5.29	.75	2.32	.18
4 lbs. corn meal	3.52	.32	2.67	.17
Totals	25.91	2.23	12.95	.67

For best results the stover should be run through a cutting box, dampened sufficiently so that when lying in a pile for 24 hours it will warm up very sensibly and soften more or less, and the grain be mixed with it for feeding. Add a little salt with every feed.

FOR A MASSACHUSETTS MILKMAN.

I am engaged in the milk business, in a small way, with the best scrub cows that I can get. We do not keep cows more than two or three years, getting what we can, and then let the butcher have them. I would like to have clean registered Ayrshires, but they cost too much for this market.

Please give me feed ration for my cows. Rowen hay, clover and corn stalks, shorts, meal, brewers' grains, dry.

Also for calves, two one-year-old, two six and eight months. Would you advise to have the year olds come fresh this fall?

Taunton, Mass. W. W. S.

Where cows are kept as above, with the view of getting all the milk possible for a year or two, and then turning them for beef, we know of no better rule for feeding, than to give them first, all the grain they will eat—increasing always only gradually—and then letting them have what roughage they crave. We would make the grain part of the ration, about one-half dry brewers' grains, and the balance equal parts, shorts and meal, all by weight.

Calves and young things should always be fed as they may need. If they can have plenty of the rowen and clover hay, they will need little or no grain. What they do have, may be the same mixture as above. Do not give them so much as to make them fat. The dairy calf is the future cow, and just as sure as she takes on the fattening habit when young, it will follow her all through life to a greater or less degree.

The best age for a heifer to drop her first calf is 24 months.

The Dual-Purpose Cow.

No. 2.

ED. HOARD'S DAIRYMAN:—The first article of my creed as published in the preceding paper makes it as clear as noonday that there is no difference of view between dairymen and myself as to the mission of the straight dairy cow. Why then do many dairymen persist in writing as though I were in an attitude of antagonism to the dairy interest? True charity should lead to the conclusion that those who have criticized me thus in the DAIRYMAN in the past, have done so, I shall not say ignorantly, but from lack of apprehension, and not with any design to misrepresent. But if the same spirit shall appear in future criticisms, after what has been said in this paper, it will not be uncharitable to say that they are made with the deliberate design of injuring, and to look upon them as emanating from their father the prince of all evil.

And in passing, I must say that I do not agree with all dairymen as to the ideal type of the dairy cow. I believe that many of them are carrying the idea of both narrowness and leanness to an extreme, and that some day, not far off, a heavy penalty will be enacted because of the extreme to which both ideas have been carried. But this point is not relevant to the subject that is being discussed.

The extremest type of beef cow is not usually a good breeder, nor is she a good nurse. Those then who breed this cow should, it seems to me, be content with high attainment in beef production, and therefore should not push the extreme beef form to the extent of injuring the powers of reproduction. Now, this cow must practically produce all the beef that is wanted to feed the millions of the Nation, on the assumption that there is no place for the dual-purpose cow. This she cannot do unless she is kept and numerously kept, on arable farms. The best authorities are agreed that the palmiest days of open ranging are a thing of the past. They believe that cattle production is decreasing on the range, and that it will still further decrease, because of the encroachments of the sheep industry. While the view thus expressed is doubtless correct, I do not expect to see cattle production decrease to any great extent in the range country, since the mountain valleys are being made to produce much food for live stock through the aid of irrigation. But it is pretty certain that cattle production cannot be greatly increased on the ranges, because of the influence of rapidly increasing bands of sheep upon the pastures. And it is equally certain that our population is increasing very rapidly. Whence then is the additional beef to come from that is wanted to feed those coming millions? The second source of beef supply is the pastoral farm. But it is fair to infer that pastoral farms, like the ranges, are stocked to their full capacity. The only place, therefore, from which these supplies can come is the arable farm.

This brings up the question: How shall beef be grown on the arable farm? All will concede that it can come from two

Swollen Neck

Also Had Great Difficulty With Her Heart—How Cured.

"My daughter had a swollen neck and also heart trouble. After the least exertion she would breathe so hard she could be heard all over the room. She could not sweep the floor or even move her arms without affecting her heart. Her limbs were badly bloated. Her father insisted that she must take Hood's Sarsaparilla, and we gave her about six bottles, when she was cured, and there has been no return of her ailments." MRS. EMMA THOMAS, North Solon, Ohio.

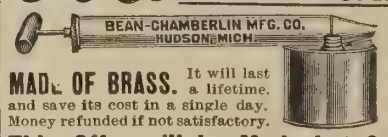
Hood's Sarsaparilla

Is the best—in fact the One True Blood Purifier. Sold by all druggists. $1; six for $5.

Hood's Pills easy to buy, easy to take easy to operate. 25c.

Gilt-Edge Butter

is the only money-making kind. But to make it, and the most of it, you must use the latest improved machinery. It is just this sort of product that has built up the demand for our



Empire Cream Separators.

They get all the cream from the milk and leave it in the best condition for churning. Lightest running and simplest in construction. Our catalogue will tell you why.

FREE HOMESTEADS

in Western Canada.

Renters, farmers' sons and farmers burdened with taxes, mortgages, impoverished soil and crop failures may secure **free homesteads** of 160 acres in the Canadian West, the land of No. 1 Hard Wheat, 25 to 35 bushels to the acre. Lowest railroad rates; special advantages to prospectors. The best grain and cattle country in the world. Good water, low taxes, abundant fuel. The Minnesota editors, who recently made the Western Canada trip, speak of it as the home for small farmers. The official report says: "To the small farmer seeking a new home Western Canada offers great inducements. While it seems a long way north the Canadian Pacific Railway line is far south of Edinburgh, the climate is that of Northern Minnesota, and the land raises splendid and sure crops." For maps and full information apply to Supt. Immigration, Ottawa, Canada or to

sources, that is to say, from the beef cow or the dual-purpose cow. Now to the writer it is evident that it cannot come from the straight beef cow without much relative loss to the farmer. In other words, beef cannot be grown on the arable farm from the straight beef cow that will bring the farmer as high a return as he will get from his dual-purpose cow in meat and milk. The return will not be nearly as much from the straight beef cow as from the dual-purpose cow. The former will, of course, produce but one calf per year.

Now suppose that the calf weighs 750 pounds at the age of one year, which is a good average weight, and that it sells for $4.75 per hundred in the market, which is probably a fair average price for such meat. The entire return from the cow during the year will be $35.63. That is all that the owner gets from feeding that cow and calf for one year. It is clear, therefore, that he makes but little profit. The dual-purpose cow will produce a calf that will weigh, at least, 700 pounds at one year, and that will sell for $4.50 per hundred. The calf then is worth $31.50 in the market. But the cream from the cow will bring in a return of $30 additional. The return for the season, therefore, from the dual-purpose cow is $61.50, as against $35.63 from the straight beef cow. The comparison is, I think, a fair one. Of course, the extra labor is not to be lost sight of.

Now remember, please, that I have been speaking only of good averages. Let no man seize upon those figures as representing my views of the highest possible production from the dual-purpose cow. Are we not therefore shut up to the conclusion, first, that the additional beef wanted to feed the increased millions of the nation must come chiefly from the arable farm; and second, that it must come chiefly from the dual purpose cow on the arable farm? Why then should I be held up to ridicule for advocating the cause of the dual-purpose cow?

Wherein I ask will such advocacy injure dairymen? Push the idea that there is no dual-purpose cow to its utmost limitations. Grant for the time being that every farmer accepted that view, what, in time, would it mean to the dairy interests? It would mean that only straight dairy cattle or straight beef cattle would be reared on the arable farm. Now, the beef grower with his sole return of $35.63 for his cow during the year and the food fed to the calf would be no match for the intelligent dairyman. Dairymen would ultimately possess the arable farms of this country. Could a worse calamity come upon the dairy interest? What would they do with their products? In the light of reason and self interest, from the standpoint of prudence, and in the face of unanswered, and I think unanswerable demonstration, would it not be better for the dairyman manfully to concede that there is a place for the dual-purpose cow upon our farms? And then would it not be wise for them to adopt the motto as they meet the owners of those cattle, "Let there be no strife between thee and me and between my herdmen and thy herdmen, for we are brethren" THOMAS SHAW.

University of Minnesota.

Peas and Oats.

ED. HOARD'S DAIRYMAN—I see inquiries about peas and oats. I raised seven acres in 1898, and will say that I think that there is no hay that equals it. I sowed one bushel of Canada field peas to the acre on plowed, not fitted ground, then fitted the ground and sowed two bushels of oats. I cut in the milk, and cured in the cock. All the fault I have to find is, that the mice like it as well as cows and horses. It has a large per cent of protein, and I think it is a splendid feed to help make a balanced ration of corn fodder. I live forty miles east of Cleveland, Ohio. H. J. C.

Iona, O.

Some More Silo Experience.

A Sack Chute in the Silo.

ED. HOARD'S DAIRYMAN:—In "A Silo Experience," page 1035 of HOARD'S DAIRYMAN, the writer says that in filling his silo, the man that did the tramping "kept the sides one to two feet higher than the center—the spreading being done after cutting one or two loads" He says that "the silage molded wherever the man stood any length of time."

There is a funny side to many things in life. In reading this experience, it seemed a little funny that a man should stand so long in one place that the silage would mold—tend to decay—or his feet were so foul that the germs multiplied so rapidly as to affect the silage. At least we must insist that the man who did the tramping is responsible for the trouble.

We have been putting up silage for five years past and have had no such experience with the men we employ. Much, however, depends upon the spreading and tramping of the cut corn.

We employ two men to spread and tramp. One of the men does the spreading as follows: Two years ago we took large gunny bags, ripped the bottoms open and basted the ends of the bags together with coarse wrapping twine, until we had a bag chute long enough to reach from the end of the carrier to within two or three feet of the bottom of the silo. By fastening one end of the bag chute over the top end of the carrier, the cut corn silage was passed down through the bag chute—the heavy and light—silage mixed well together, and delivered wherever wanted by one of the men, who passed around holding the bag chute so as to deliver evenly over the silo, keeping the surface as near level as possible. The man manipulating the bag chute was all the while moving—tramping the silage. As the silo filled up, a bag was ripped off and thrown out, and so on until the silo was filled to within five or six feet of the top. The other man in the silo gave special attention to tramping the outer edges and corners of the square silo and outer circle of the tub silo. We have found that the keeping of the silage depends largely upon the even mixture of the heavy and light together and the most faithful tramping of it. The use of the sack chute does the mixing so perfectly and so easily, that we are made happy in the use of it. The silage in our tub silo, filled as above described, keeps perfectly to the staves. In our square double walled silo, the ensilage does not keep well in the corners. We are able with the sack chute to pack the silage more evenly and thus add to the better keeping of the silage in the corners, but we have some loss yet. In the use of the two kinds of silos, we have this to say: We can build a tub silo of 100 tons capacity for less than $100, or at almost quite half the cost of a square, double wall silo, and the excellent quality of the silage in the tub silo (in this climate) will be most satisfactory indeed, compared with the ensilage in the square silo. Much of the ensilage in the square silo will be very good, yet that in the corners, and sometimes running along the sides three, four or five inches into the silage in places, is a disappointment. Filling with a bag chute and thorough tramping will save most of the loss, but not all of it.

We have it in mind to put up another tub silo the coming summer as follows: Scrape off the top soil, until the earth is firm, and spread gravel four or five inches deep over firm earth. Pack the gravel and coat over the top with cement 1½ or 2 inches thick and set staves on the cement, coat the outside of the staves a foot or so high with coal tar, then back up with cement against the staves at the bottom outside, two or three inches in thickness, then coat the cement with tar thoroughly to keep the water from running down to the bottom of the staves. The size of the silo will be sixteen feet in diameter and twenty-four feet high.

We use 2×6 inch hard pine lumber center matched and milled so as to make a tight joint when set in the required circle. Lumber required, board measure 2,500 feet; cost, $2.40 per hundred matched, $60 ready to set up. Iron hoops three-fourths rods, estimated cost, $15; foundation, $5; expense of setting up, $10; total cost $90; estimated capacity, 90 tons. We intend to use it without any cover. Why not? A foot or more of the silage on top will spoil at best. Without a roof, we can pack the top silage so much better, that it will save a ton or more of silage. We intend, however, to feed it out first, beginning about the middle of October. A little rain on the top, as we look at it, will not damage it.

J. J. W. BILLINGSLEY.

Indianapolis, Ind.

IS YOUR HAIR TURNING GRAY?

What does your mirror say? Does it tell you of some little streaks of gray? Are you pleased? Do your friends of the same age show this loss of power also?

Just remember that gray hair never becomes darker without help, while dark hair rapidly becomes gray when once the change begins.

Ayer's Hair Vigor

will bring back to your hair the color of youth. It never fails. It is just as sure as that heat melts snow, or that water quenches fire.

It cleanses the scalp also and prevents the formation of dandruff. It feeds and nourishes the bulbs of the hair making them produce a luxuriant growth. It stops the hair from falling out and gives a fine soft finish to the hair as well.

We have a book on the Hair and Scalp which you may obtain free upon request.

If you do not obtain all the benefits you expected from the use of the Vigor, write the Doctor about it.

Address, DR. J. C. AYER, Lowell, Mass.

An Ontario Opinion and Query.

ED. HOARD'S DAIRYMAN:—We are behind I believe with our subscription, but I am sure it is very kind of you to continue our paper. You have passed sound judgment on us, knowing we couldn't get along without it. I appreciate its pages very much, and find it indispensible to profitable dairying. I have a herd of A. J. C. C. cows and am making dairying pay, partly due to the practical and sound knowledge I find in the DAIRYMAN. I endeavor to convince my neighbors that they cannot afford to be without it. I miss nothing published in it.

I would like a ration compiled if you please. Corn ensilage, (well eared) clover and timothy hay, mixed and well cured, good oat straw. Have some cotton seed meal on hand, 500 or 600 pounds. Can buy bran at $14.00 per ton and kiln dried feed at $12.00 per ton and gluten meal at $14.00 per ton. These two latter are that which is left after extracting glucose and starch from corn at a starch factory. This kiln dried feed is the wet stuff dried. Is this gluten feed. Cows are A. J. C. C. Jerseys, mostly fresh I want to feed some straw each day. I am feeding ensilage and grain in morning; soon as eaten, some of the mixed hay; at 4 o'clock the cut straw, and on this ensilage and grain, which only means twice a day. Cut all the straw for all purposes.

Winchester Springs, Ont. S. S. & SON.

Although our general rule is to stop the paper about the second week after the subscription expires,—yet there is a constantly growing list of persons, who, in one way or another, have indicated a desire not to have their names removed, and to them the paper is forwarded until notified to the contrary.

We thank the writers of the above communication, for their kind words of appreciation, and commend the opinion they express, to the candid consideration of others who may be seeing a copy of HOARD'S DAIRYMAN for the first time, or have read several numbers without finding satisfactory evidence of its adaptibility to their wants. It may sometimes happen that a reader is as much at fault as the paper.

In reply to the feeding inquiry we have to say, that we suppose the "kiln dried feed" referred to is, in fact, "gluten feed," and we suspect it does not differ, materially from the alleged gluten meal. Gluten meal, of good quality, is not usually sold at $14.00. We have often described the difference between the two, consisting in the presence or absence of the corn bran. There is no other distinction that we know of, and this makes the meal more highly concentrated, and necessitates the use of more bran or some other diluent.

We suggest as a fair general average the following:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
20 lbs. silage.....	5.28	.26	2.80	.14
10 lbs. mixed hay....	8.58	.48	3.96	.16
5 lbs. straw.....	4 44	.06	1.93	.04
6 lbs. gluten feed....	5.53	1.22	2.90	.30
3 lbs. bran.....	2.64	.38	1 16	.09
Totals.....	26.47	2.40	12.75	.73

While the cotton seed meal lasts, let two pounds of it take the place of three pounds of the gluten feed, and we should invariably mix the grain and the chopped straw with the silage. The amounts of silage and hay may be increased and decreased interchangably to accommodate the amounts on hand.

Chicago Milk Supply.

ED. HOARD'S DAIRYMAN:—January has passed and with it another settling day for the Chicago milk shipper. A canvass among milk shippers shows the prices paid per eight-gallon can varied from 80 cents to $1. While there were some who only received 80 cents, and some who received a dollar; perhaps it would be closer to the correct figure to say that most of the shippers received 85 to 90 cents. This is about the same as January, 1898, although butter is about one cent less than a year ago.

The December report of the Chicago Department of Health is at hand, and it shows that during the month there were 1,588 analyses made of milk and cream of which 162 were tagged "skimmed milk," and 655 were not tagged, therefore sold for whole milk. Of the latter, ninety-three were below grade. Out of 432 samples of cream, thirty-six were below grade. The per cent of samples of milk and cream below grade was 9.13. Of the 1,588 samples analyzed, 339 were brought to the laboratory by private individuals; the remainder, 1,249 were collected by the Milk Inspectors. We might add that the samples below grade 9.13% is rather high for the winter time and especially so when we remember that the Department has made a showing of less than 4%.

It might be interesting to those who are following the question of tuberculosis, to state that during 1898 there were 22,793 deaths in Chicago and of these, 2,829 died of consumption or other tubercular diseases and 2,856 died of pneumonia and other diseases of the respiratory system. Nearly one-quarter of the deaths which occurred in Chicago during 1898 were from lung troubles.

We do not undertake to say that all these deaths are due to cows having tuberculosis, but the percentage of deaths from this cause is large, and we do say that all who eat the flesh of tuberculous cattle are taking a risk and expose themselves to the disease.

Some time ago we had the pleasure of listening to Mr. H. B. Gurler, of DeKalb, Ill., make an address in his own characteristic style, on the Mistakes on our Dairy Farms. While it would be hard to pick out from that address the most important subject, yet there was one point on which he touched, which gave us some definite information. He spoke of noise in the dairy, and read from "The Dairy", London, England, an article which said that a certain farmer bade his hired men turn the cows into the yard and go in among them with sticks and dogs and drive them around in the yard, as some of his neighbors were in the habit of doing, when putting their cows in the stalls. The result of this experiment was that the flow of milk was diminished so that the quantity received was worth 50 cents less than the previous evening.

This statement brought another from a farmer in the audience, who also kept a record of his dairy and found that a steam fitter working in the barn near the cows, caused a shrinkage in the flow of milk.

Personally we like to treat a cow as we would a well bred horse. And, if, when we try to drive her, the cow kicks up her heels and runs, we do not think it any more strange than if a horse would do the same thing.

A halter is a good and safe thing to have on a cow when you want to take her into any new or strange place. They soon learn to lead, in fact calves should be accustomed to it, and when once broke, one man can take a cow almost any place.

Mr. Gurler further reported that the cow in his herd, which did the best in 1898, had made a yield of about 415 pounds of butter.

Chicago. THE INSPECTOR.

Bone Meal for Abortion.

ED. HOARD'S DAIRYMAN:—Seeing the article in Jan. 13th and Feb. 17th on abortion, I would venture a suggestion in accordance with my own experience. While working in a dairy of over 107 cows, for over five months there wasn't a full time calf born, and over two-thirds of them came fresh during that time. We decided, upon watching the actions of the cows, thinking they lacked some substance, and perhaps it was bone, so we gave them bone meal with immediate and perfect results. Not only that time, but have personally seen it tried three times since—the theory being the cows being fed on high, concentrated food and much stabling, do not get bone substance enough; anyway it did the work. F. C. BAKER.

Caution—The market is full of imitations, represented to be the same as **BROWN'S Bronchial Troches** of Boston

The Genuine has the Fac-Simile Signature of John L. Brown & Son on every box.

Gluten Feed

will increase the flow of milk—improve the quality, and keep your cattle in the best possible condition. Please note following comparative figures:—

Corn Meal contains 9% Protein, or 180 pounds milk producing material per ton.

Wheat Bran contains 15% Protein, or 300 pounds milk producing material per ton.

GLUTEN FEED contains 26% Protein, or 520 pounds milk producing material per ton.

This statement can be verified by your State Agricultural College, and proves conclusively that for the money invested **GLUTEN FEED** is the cheapest feed for you to buy.

Ask your feed dealer for **GLUTEN FEED.** If he does not keep it in stock, write us his name We will communicate with him immediately. At any rate don't fail to give **GLUTEN FEED** trial. It will certainly help you lessen the cost of milk production.

Write us addressing Department E for circular, illustrating the "Value of Butter Fat in Milk," just issued. Yours truly,

THE GLUCOSE SUGAR REFINING CO.,
The Rookery, CHICAGO, ILL.

Facts Confirm Opinions.

See Page 1051 Last Volume.

ED. HOARD'S DAIRYMAN:—I was somewhat surprised in seeing the cut of our four Holstein cows, that you had to regret that the records were not to hand, as I sent you under separate cover, some time ago, some particulars. As you are good enough to say the records would be interesting and instructive, I send you the same from which you can take whatever data you may find space for.

The cow in the right center, of which you say "it is practically impossible to find any fault with her in any particular," is the great public test winner, Calamity Jane, winner of sweepstakes in Provincial dairy test 1895, 1896, 1897, and 1898. Record in public test, 85 pounds milk in one day; 166½ pounds milk and 19.31 pounds total solids in two days, which we believe to be the highest record for that sort of race. You will see by enclosed print, she has given 100 pounds of butter, 80% fat, in thirty days—most of this time tested by members of O. A. C. staff.

The white cow is Winnie R., record 17,502 pounds in one year. Next is Daisy Teral 2nd, the heifer that made in the two days' test, 134½ pounds milk testing 3.2% fat, or 4.306 pounds butter fat. Next is Calamity Jane, and on the right outside is Lady Pietertje's Konigen, winner of 2nd in the Provincial test, first prize cow, London 1897.

These four cows made in Provincial test, in two days, 60 pounds total solids. The four best Jerseys made 30 pounds total solids, and four best Ayrshires, 30 pounds. They were not made screw ended for nothing.

Curries Crossing, Ont. A. J. G. RICE.

Our Special Elgin Letter.

ED. HOARD'S DAIRYMAN:—The offering of butter on Monday's Elgin Board of Trade aggregated 7,980 pounds. Two lots amounting to 1,260 pounds remained unsold, and 6,720 pounds were sold at 22 cents. The Quotation Committee declared the market active at 21 cents.

The sales reported were as follows:

Factory.	*Pounds.*	*Price.*
Shabbona	2,160	22c.
East Burlington	480	"
Red Clover	1,200	"
Brooklyn	1,680	"
Oregon	600	"
Syene	600	"
Total	6,720	

The Board passed a resolution declaring the bills touching the dairy interests, now before the Illinois House and Senate, to be of the utmost importance to the farmers of the state, some 40,000 of whom are represented in a business way by the Board, and calling upon every Senator and Representative from Northern Illinois to give support to the passage of these measures, preserving them intact in their original provisions, particularly as to appropriation, which is too small, if anything, for the necessities of the state.

The markets for the corresponding week of the three preceding years were as follows:

Feb. 21, 1898, 9,180 lbs. of butter sold at 20c.
Feb. 22, 1897, 48,180 lbs. of butter sold at 18c.
Feb, 24, 1896, 68,160 lbs. of butter sold at 20@21c.

The New York market, Monday, was reported steady at 22 cents. H. C. B.

Illinois, Ill., Feb. 20, 1899.

CONCERNING OUR ADVERTISERS.

TEST OF DAIRY MAID OF ST. LAMBERT 112483.

ED. HOARD'S DAIRYMAN:—Dairy Maid of St. Lambert 112483, dropped February 14, 1895, dropped her last calf—a heifer—September 9th, 1898. For the seven days ending September 16, 1898, she gave 243 pounds, 12 ozs. of milk that churned 16 pounds, 12⅓ ozs. of butter, salted 1 oz. to 1 pound, and worked ready for market, Dairy Maid of St. Lambert 112483 is a model dairy cow. She is sired by Ida's Rioter of St. Lambert 13656, sire of twenty-eight tested daughters. She is out of Ingleside, test 20 pounds, 4⅓ ozs, and she out of Gypsy's Pride 2nd, test 27 pounds, 12 ozs. A. J. KINDBERG, tester.

Lone Tree Stock Farm, Greensburg, Ind.

We should not like to farm without an "Acme" Harrow, Clod Crusher and Leveller. If we could not buy one without borrowing we should borrow, though borrowing goes against the grain. In plain farming the "Acme" is almost indispensable; in gardening and trucking is quite so, It will be sent on trial, to be returned at the manufacturer's expense if not satisfactory.

SAVING MONEY ON CARRIAGES, IMPLEMENTS, ETC.

Fair dealing for nearly thirty-five years entitles a business house to the confidence of any community. The one merit of consistent fair dealing that has belonged to the house of John Dorsch & Sons, of Milwaukee, Wis., for a third of a century, would be enough to explain why they have grown great from small beginnings and why farmers who buy from them once continue the practice year after year The new catalogue for 1899 and 1900 gives further hints as to the causes of the firm's success, because an experienced buyer sees at a glance that the carriages, wagons and farm implements which it illustrates and describes are goods of honest merit, sold for exactly what they are, with the privilege of returning anything that is not exactly as represented, and the prices are low. Messrs. Dorsch & Sons base their low prices on improved business methods, selling goods direct and saving the heavy expense of agents or retail dealers' commissions. Everybody who has need of carriages, wagons or farm implements, should write for a copy of this catalogue of John Dorsch & Sons.

DAIRY MARKETS.

ELGIN, Ill., Feb. 20—Butter—Active; offerings, 133 tubs; sales, 112 tubs, at 22c; official market quotations, 21c; butter last week, 22c; one year ago, 20c.

CHICAGO, Ill., Feb 20—Butter—Creamery, extras, 21@21½c; firsts, creamery, 19@20c; seconds, 14@15c; dairies selected, 18c; No. 1 15@16c; No. 2 13c; extra ladles, 14c.

Eggs—At mark, cases included, 23@23½c and cases returned 22½@23c; seconds 2.50@3.00 per case; frozen 10c per dozen

Cheese—Full cream Twins, good to choice, 10@10¼c; Cheddars, 9¾@10¼c; Young Americas, 11c; Swiss, 10@12c; Limburger, 8@10¼c; Bricks, 8½@10½c.

Cattle—There was a big run of cattle, yet "good" native steers were very scarce. Strictly prime 1,400-lb. steers would bring $6, yet the best cattle offered, 61 head of 1,585-lb. Westerns, sold at 5.65. The top a week ago was 6.10 and a year ago 5.60. Straight Texas steers sold as high as 4.75 against 4.30 a week ago, and 4.35 a year ago. The 4.75 Texas were strictly choice. About 2,300 Texas were received, being the largest run of the year. They sold about 10c lower than last Friday at 3.50@4.75; bulk, 4@4.50. Native steers sold steady to 10c lower at 3 70@5 65, bulk 4.50@5 20; fed Western steers, 4 15@5.45; native cows sold at 1.50@4.25, bulk 2.60@3 50; heifers 2.60@4 50, with two loads of fancy 1,355-lb Westerns at 5.10. Native bulls sold at 2.80@4; stags, 2.75@4.35 and feeding cattle, 3.40@4.65. A load of 1,707-lb distillery fed oxen sold at 4.65.

MILWAUKEE, Wis., Feb. 20 Butter—Creamery, extras, per lb. 20½@21c; firsts, 18@19c; seconds 16@17c; imitations, 16@17c; fresh dairy, good to choice selections, 16@17c. Market lower and quiet; supply fair

Cheese—Full cream Twins, per lb. new, 10½@11c; Brick, 10½; Limburger, 9½@10c; Swiss, 10½@11½c.

Eggs—Fresh per dozen 23@24c. Market again higher and excited.

PHILADELPHIA, Pa , Feb 20—Butter—Solid-packed, separator creamery extras, 23c; creamery firsts, 22c; seconds, 19@20c; imitation creamery, extras, 18c; firsts, 17c; seconds, 15c; ladle-packed, extras, 16c; firsts, 15c; seconds, 14c Print Butter—Creamery extra, 24c; firsts, 23c; seconds, 20@22c.

Eggs—Pennsylvania and near-by, 20c; Western, 20c; Southwestern, 20c.

KANSAS CITY, Mo., Feb. 20—Butter Firm; creamery, 16@21c; dairy 17c.

Eggs—Supplies light, prices advanced 1½c; fresh candled Missouri and Kansas stock, 18½c, cases returned; 19c in new whitewood cases, cases returned.

ST. LOUIS, Mo., Feb. 20—Butter—Steady; creamery, 20@24c; dairy, 14@18c.

Eggs—Higher, 23½c.

CINCINNATI, O., Feb. 20—Butter—Steady.

Eggs—Steady; 18c; Cheese—Firm; good to prime Ohio flat, 11@11½c.

NEW YORK, Feb. 20—Butter—Creamery western, extras, 22c; firsts, 20½@21½; state finest, 21½@22c.

Cheese—State full cream, large, colored or white, fancy, 10½c; choice, 9¾@10c; small fancy, 11@11½c.

Eggs,—Western, fresh-gathered, firsts, 23c.

BALTIMORE, Md., Feb. 20—Butter—Market quiet; creamery separator, extra 25@26c; creamery separator, first, 23@24c; creamery first, 22c; ladle extra, 17@18; Western store packed, 14@15c.

Eggs—Market for strictly fresh stock, 20c.

BALTIMORE MARKET.

BALTIMORE, Feb. 16—Butter—The weather has interfered somewhat with the movements of this article, out as well as in, so that honors were about easy. The advance at the West has had its due influence upon prices, and the realization that the supply of fresh makes is diminishing to a considerable extent, and the stocks of saved goods in the freezers are fast melting away, has further tended to enhance values. There seems to be no excitement at all any where, and no solicitude as to the course of events in the near future; for the good of the producers it is to be hoped that a conservative policy will rule the prices henceforth, and thereby tend to foster the awakening interests manifested of late by foreign buyers. It soon will be Spring, no matter how wintry the weather at present; and with the advent of Spring comes the free flow of new milk and increased supply of butter; we will want a continuance then of existing outlets and perhaps new one, so an open door foreign policy—opening outwards only—is the one to advocate for this business. The shortage in the supply of rolls seems to be noted more than the other shortcomings this week, and a brisk demand is the consequence. Creamery Separator, extras 23@24c; firsts 21@22c; seconds 19@20c; Gathered Cream, extras 19@20c; firsts 18@18½c; seconds 17@17½c; Creamery Ohio, extras 21@22c; firsts 20c; seconds 17@18c; Roll, extras 14@15c; firsts 13c; seconds 12c; W. Va. Roll, extras 13@14c; firsts 12c; seconds 11c; Creamery Blocks (2 lbs.), extras 24@25c; firsts 22@23c; seconds 20@21c; Creamery Prints (½ lb.), extras 24@25c; firsts 22@23c; seconds 20@21c; Md., Va. & Penna Prints, extras 20@21c; firsts 18@19c; seconds 15@16c.

Eggs—Owing to the general snow blockade all over the country there are few, if any, eggs coming in, and our market for the present is quite bare of stock; there is a brisk demand at the big advance in price, so would advise you to ship all you can as we do not expect these prices to hold much longer, but be sure to have them well protected, so as to prevent freezing in course of transit. Prices are firm at 29@30c;

Cheese—Our cheese market is in good shape and firm with moderate offerings, and a good demand for desirable grades. N. Y. State—Cheddars, fine 11@11¼c; choice 10¼@10½c; fair 7@8c; Flats, fine 11¼@11½c; choice 10½@10¾c; fair 7½ 8½c; Small, fine 11¼@11¾c; choice 10¾@11c; fair 8¼@9c; Ohio—Flats, fine 10@10½c; choice 9@9¼c; fair 8@8½; Ohio Picnic, fine 10½@10¾c; choice 9¼@10c; fair 8½@8¾c; Swiss Cheese, fine 11@12c; choice 9@10c; fair 8@8½c.

301 Exchange Place. G. M. LAMB & BROS.

FOREIGN MARKET.

BOSTON Feb. 18—Cable advices of this date, from the principal markets of Great Britain to Geo. A. Cochrane give butter markets as inactive. The mild open weather and heavy rains, coupled with liberal arrivals from America, which more than offset the diminished arrivals of Australian, make buyers press their advantage, and in order to move arrivals at all freely, concessions have to be made. Australian and Canadian in boxes are selling fairly well when holders will accept 21@22c. American butter is in so many hands, and being almost entirely in tubs, causes a wide range of prices, The best is difficult of sale at 19@20c, with some holders offering very good value at 18@19c. Finest fresh imitations are selling the best of any American butter, prices ranging from 16½@18c Ladles are selling slowly at 15c downwards.

Cheese markets are quiet with no speculative buying, and finest Septembers are to be had at 10½@11c. The best demand is in under grades that can be sold from 10c downards.

READING NOTICES.

All Reading Notices under this head are at the rate of 25 cents per line.

Canadian Cheesemaker—Wants position. Years experience, good recommends, work guaranteed. Address H., care of HOARD'S DAIRYMAN.

Two Married Men want employment on farms. Small families. Want steady employment as farm hands. Experienced, having always worked on farm. Address SAM OVERWAY or SAM BIRKHOFF, 2597 Union St , Pullman Sta., Chicago, Ill.

Situation Wanted as buttermaker; am competent to take full charge of factory. References furnished. Satisfaction guaranteed. J. E. FORWARD, Wexford, Pa.

For Sale—8 can Champ. cabinet creamery, $15.00; 60 gal. "Ideal" bbl. churn, roller bearings, $6.00; 50 gal. cream vat, copper bottom, metal lined, ice or steam, $ 0.00; Eureka butter worker, $4.00; 20 cases of 5 lb. spruce Bradley butter boxes, 40c. case. J. T. CLARK, Clinton, Mich 2-2

Dairy school graduate wants work in creamery or dairy. Address "HOLT", Andover, Mass. 2-2

A first-class buttermaker desires a position. State New York or New Jersey preferred. Address BOX 52, Harford, Cortland Co., N. Y.

A Complete creamery outfit for sale cheap that has been used but very little. Address HABIGHORST BROS., Sheboygan Falls, Wis. 1tf

Iowa Farms For Sale—$2 per acre cash, balance ⅓ crop until paid. J. MULHALL, Sioux City, Ia. 1-3

Hermanville Tamworths, Yorkshires, etc. J A. MACDONALD, Hermanville Farm, P.E.I., Can 32-52

For Sale—One first-class creamery and skimming station. DOWNING MFG. CO., Downing, Wis. 35-tf

An Entire Carload—Of high graded Jersey cows and heifers are in my hands for sale immediatley. F. H. MERRELL, Portage, Wis. 52-tf

For Sale—A very desirable and good paying dairy, consisting of 20 head, or more of Holstein graded cows; average milk sales of two hundred dollars per month. C. H. ELLIS, Waxahachie, Texas. 52-tf

Wanted—Position by reliable, first-class butter or cheese maker; four years' experience; high-grade goods; best of references, wages reasonable. J. H. WINES, Ames, Iowa. 1-2

Wanted—Position in dairy by neat, industrious man. Can make butter, very successful in the care of cattle and hogs. Can handle any kind of separator. Have had experience in all branches of farm work. Can give No. 1 references. Will guarantee satisfaction. Address F., care Hoard's Dairyman. 1tf

Wanted—Position in a separator creamery. Have worked 16 years at the butter and cheese business with best of success. Understand running the latest machinery. Can warrant my butter. Address S., care Hoard's Dairyman.

Wanted—To trade a 43-acre farm, good six room cottage, and barn. Land rolling, and nearly surrounded by oil wells, producing from 10 to 400 bbls. per day, ½ to 3 miles away. Situated 10 miles from Parkersburg, 4 miles from railroad. Will be sold for high grade or full-blood Jerseys or $1,500.00 cash. This is cheap outside of the prospect for oil. Don't write unless you have first-class individuals. Also will sell or trade 416 acres of fine coal land in Kanawha county, 6 miles south of Charleston, Davis' Creek. R R. runs through property. 95% of land underlaid with three seams of coal, one seam, 40 in., is free from any slate and with a bare trace of sulphur. There is no finer bituminous coal in West Va. Will take $5,000.00 worth of full-blood Jerseys and $5,000.00 in notes of one, two and three years. Titles guaranteed, J. F. WOODYARD, Parkersburg, West Virginia. 2-4

Home Seekers' Cheap Excursion—The North-Western Line will sell home seeker's excursion tickets February 21, March 7 and 21, with favorable time limits, to numerous points in the West and South at exceptionally low rates. For tickets and full information apply to agents Chicago & North-Western R'y. 52-3

Lands in Wisconsin Cheap—The Chicago, St. Paul, Minneapolis & Omaha Railway Company has upwards of 400,000 acres for sale in northwestern part of the state at low prices and on long time. These lands are most desirable because of their proximity to the markets of Minneapolis, St. Paul, Ashland, Eau Claire, Duluth and Superior. If you wish to visit these lands homeseekers cheap excursion tickets can be secured at C. & N. W. ticket offices in Chicago, Milwaukee, Janesville, Beloit, Elgin, Aurora, St. Charles and Dixon March 7th and 21st. Maps and information furnished on application to G. W. BELL, Land Commissioner, Hudson, Wis. 2-4

National Champion Buttermakers

EVERY ONE AN

"ALPHA-DE LAVAL" USER.

The honor scoring record of "Alpha" disc made butter the past five years has been a marvelous one the world over, "Alpha" and "Baby" separator butter having made a practically clean sweep of all higher competitive averages and awards in every general contest—National and International, State and District—in America and all other countries.

There have now been seven Annual Conventions and Grand competitive Butter Contests of the National Buttermakers' Association,—1892, 1893, (none in 1894), 1895, 1896, 1837, 1898 and 1899. The following is the list of years, places of convention, names and addresses of sweepstakes Gold Medal winners, and the highest scores. Every other higher prize winning exhibit likewise has been "Alpha-De Laval" made:

1892, Madison, Wis., Louis Brahe Washington, Iowa	score,	98
1893, Dubuque, Iowa, C. W. Smith, Colvin's Park, Ill	"	97
1895, Rockford, Ill., F. C. Oltrogge, Tripoli, Iowa	"	98
1896, Cedar Rapids, Iowa, Thos. Milton, St. Paul, Minn	"	97.82
1897, Owatonna, Minn., H. N. Miller, Randall, Iowa	"	98.5
1898, Topeka, Kas., Sam'l Haugdahl, New Sweden, Minn	"	98
1899, Sioux Falls, S. D., A. W. McCall, Creston, Iowa	"	97

Every experienced separator buttermaker understands that while the separator does not of course make the butter, that the "Alpha" disc separation process does contribute largely to the superior excellence of the butter produced with its help—in the lower temperature at which a thorough separation can be accomplished than is approachable by any other separator; in the more complete removal of dirt, fibrous and casein matters than is possible with any other separator, and in the "smoother" and more even'y churnable quality of cream than can be produced with any other machine, due to the much lower relative speed and diameter of bowl and the perfectly proportioned adjustment of inlets and outlets which the "Alpha" disc principle alone makes possible

These advantages have a bearing upon the grain, texture, solidity, flavor, and keeping qualities of the butter, which in combination with equal conditions of milk and equal care and skill upon the part of the buttermaker invariable give to "Alpha" disc made butter its manifest superior excellence.

The De Laval catalogues touch upon these subjects in greater detail and may be had for the asking.

A Model Cow Stall.

In response to numerous inquiries for a good cow stall, we republish the following cuts and description of the Scott cow stall.

In the first place, the stable has enough light in it to take the photograph of it in a quarter of a minute's exposure, which was taken after cows were put on pasture and all bedding removed and stalls swept out, and by the way, are kept so through the entire summer for milking, night and morning.

This stall is not only in common use in this immediate locality, but throughout Ohio and many other states, and dairymen who have put them in find they made no mistake,

Figure 1.

for the reason that they give to the cow so near perfect comfort and absolute cleanliness that their introduction has made the keeping of cows more of a pleasure, than before using them.

While figure 1 gives a perfect rear view, figure 2 will explain more clearly the side section and measurements, etc.

The platform, A, is made of one-inch oak, doubled and joints broken, with a fall of two inches, and is six feet, six inches long for a cow weighing 1,000 pounds, and should be correspondingly longer or shorter as the weight of the cow may require.

This feature may be provided for by placing the fencing, in front of the cow, nearer for the cow to eat hay through, and to keep her standing back to her ditch.

The hay rack at E is eighteen inches wide and three feet deep to F, and is open with a six inch thwart so that grain, ensilage or any cut feed readily falls through into feed box. The ditch is sixteen inches wide and nine inches deep on platform side and seven inches at rear and is made absolutely water tight. The latter feature, along with the broken joints on the platform, always insures good sanitation as with every particle of manure and liquid voiding where absorbents and deodorizers can be applied, puts the stable in shape so that its care taker can keep it pure and sweet, with little effort, and have some place to take callers into when showing his best cows without having to prefix and suffix the visit with an apology.

Any farmer I think, can erect this stall with the use of a good saw, hatchet, jack plane and square, at a trifling cost, and when once completed am positive that it will be a great source of pride to the dairyman who has it in his barn.

After four years of use, and keeping cows confined from four to five months, each winter, day and night, am able to say that it is a perfect stall and not only keeps the cows perfectly clean, but have not seen a stall that gives the cow so much freedom for her head and body.

We tie with ordinary tie chains, and by the

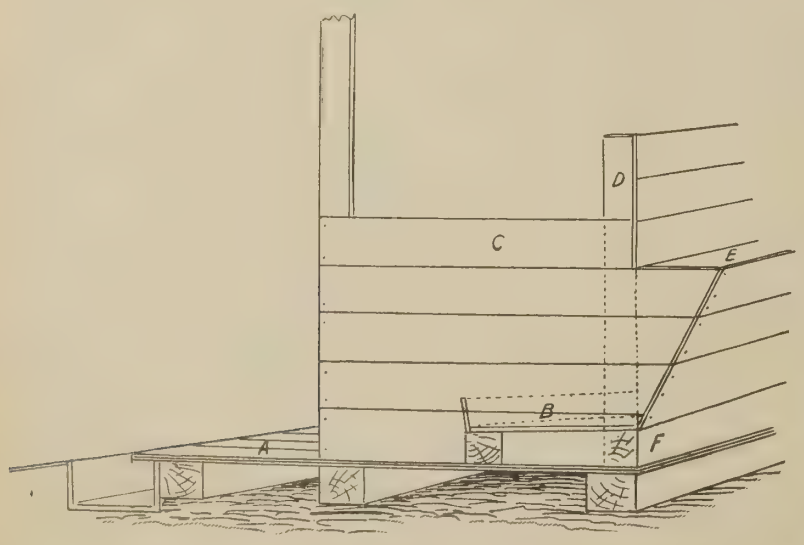

Figure 2.

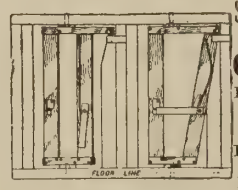
toward the ditch or further away or sometimes the ditch is run at an angle or an offset at one end, but the former is by all means the most satisfactory.

The feed trough B is raised by running two 2×3 stringers the entire length of the stable making the trough eighteen inches wide and six inches deep in front of cow. The stalls are three feet, three inches wide from centres, and partitions four feet high and three feet six inches long at C. The posts D are five feet high made from 2×3 studding, and toe nailed in the corner of each feed box at F and 1×3 lath nailed to them use of a large ring or a strap around the second bar in front, can be moved from one side of stall to the other.

Ohio. GEO. E. SCOTT.

Milking.

Extract from the Swedish and Danish. By J. Moldenhawer, Washington, D. C.



ED. HOARD'S DAIRYMAN:—I am confident that one of the foremost reasons for the slow progress the dairy business in the United States is making, at least when compared to the rapid improvemements which are constantly taking place along almost all other lines of business, is mainly to be found in the difficulty to secure good and reliable men and women to perform the milking. While this difficulty is becoming more general everywhere, even in the most advanced dairy countries, still as long as it over here is comparatively easy to make a fair living in other occupations which are less confining, the task of securing competent milkers at reasonable wages will be a hard one; and yet, no matter how much we now and then may hear about the excellent work of certain milking machines, the fact still really is, that no machine has as yet been found to do the work in such a manner that it under all and any conditions would be able to compete with a first-class milker. The place for which a milking machine is best adapted is, of course, the large estate; where a large number of cows are kept and where everything can be done in clock work order. And nowhere can we find large private dairies, with from 100 to 400 cows, where everything

WANTED—Agents for the Roney Hay Fork Returner and Seibel's Wind Mill Lubricator. Mill oiled from ground. RONEY RETURNER CO., Box D, INDEPENDENCE, IOWA.

is as near perfection as they are seen in Denmark. The Swedes, who are rapidly progressing along the same lines as the Danes have done, keep their eyes wide open as to what the Danes are doing, and in *Landtmannen* publish an extract from "*Ugeskrift for Landman*" of a proposition made by the well known dairy instructor, Boggild, as to an improved arrangement on the dairy estates of that country for the employment of milkers and laborers for the cow stable. He mentions how it of late years has become almost impossible to secure a sufficient number of good milkers for these large dairies; tenant's wives, laborers, boys and some girls are employed and the result is often that the milking is not as carefully done as it should be, which again causes loss in milk production; even the necessary hands for attending to the feeding and care of the cows are hard to get, and the result is that the overseer is almost afraid to correct them, or to discharge them, because he knows it is almost impossible to find others to take their places. (Is this not often exactly the case with us too?)

But while in Denmark these difficulties are increasing on the large estates, it is a promising sign that on the small farms the opposite is the case. Formerly, milking was looked down upon as the lowest kind of work on the farm, but since the co-operative creamery system has developed so extensively, the peasants have gotten their eyes open for the absolute necessity of having their cows well cared for and especially well milked; thus, now it has become a common occurrence that the wives, daughters and sons of well-to-do "housemen" take part in the milking; but while it is considered perfectly proper that they should do so at home, still these same parents do not wish to let their sons and daughters perform such work on the estates; because they are there often thrown together with undesirable company. And thus while the prospects for having the dairy well attended to on the small farms is becoming better, on the estates things are growing worse, and some remedy should be found if possible, as it will never do, in Denmark at least, to give up dairying.

Mr. Boggild suggests that the large estates learn a lesson from the co-operative creameries, which hardly ever have any difficulty in finding sufficient proper help for all work to be done. In these it is common that the manager or superintendent agrees to have all work in the creamery attended to, and he employs butter-makers, (male or female) engineers and apprentices, who, as a rule, all board with him and eat at his table. Likewise might the owner or renter of an estate engage a young and energetic man to take charge of all work about the cow stable, as milking, feeding and caring for all cattle and hogs at a certain fixed salary, as well as a house and garden to enable him to have his own house keeping and to board all his help—if this were done, it is very probable that the work would be far better done in every direction.

Test milking should be done regularly and an exact account be kept as to the amount as well as the quality of each cow's milk, in order to have the "rats" (the name given the worst specimens of cows in Denmark) removed. Strict account must also be kept as to time of calving, etc. In this manner, the foreman as well as his helpers should be able to secure a fair income, as in most cases really a smaller number of employees will do the work as well or better than the larger number, now often employed in the large estate dairies. Important is it that all hands take part in the milking, regularly, so that this work may be finished in the shortest possible time.

To the above suggestions by Professor Boggild, in Denmark, I shall add a few from Professor Winberg, one of the editors of the Swedish "*Tidsskrift for Landtman.*" He also mentions the great difficulty, even in Sweden, to secure good milkers, which means such persons who not merely milk well, but who will take an interest in their work, and make it their ambition to do it well, always.

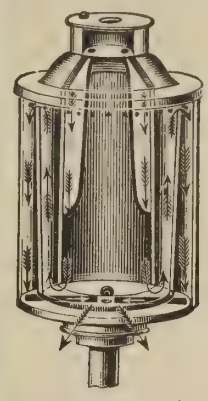
Among the means by which we may stir up an interest in milking, he suggests the introduction of regular prize-milkings, such as already have been held very successfully in Denmark, in several communities.. (By the way, we have secured one young Danish milker on our "Sanitary Farm", who took a prize for milking 16 cows well in one hour.) In this manner, Professor Winberg thinks that young men and women might be induced to milk, when they could be made to feel that they were performing a task highly estimated by others, and of which nobody need be ashamed.

Professor Winberg also suggests that practical and theoretical courses be arranged for both young women and men, in care and feeding and milking of cows, and that also prizes should be given those who showed most interest and attention to the work, this being so much more important, as the lack of good herdsmen and feeders is almost as great as that of good milkers.

I have given these suggestions from Denmark and Sweden, because I believe they, in many respects, apply to our country as well. We may do all we please to improve our creameries and our butter-makers (and we certainly should not lessen our efforts in that direction) but as long as we do not succesd in improving our dairy farmers, and our milkers and feeders, as well as our stables and our cows—just so long shall we continue to hear the old cry, and justly so, that "dairying does not pay." And it never will until we can do something by which our farmers can work up from their lethargical indifference, and bestir themselves and begin at the beginning, and get better cows and better care of them in every direction.

Influence of Cold and Storms on Butter Fat.

ED. HOARD'S DAIRYMAN:—The Manhattan Creamery received milk on February 3, which according to the usual calculations would make 227 pounds of butter; but when the cream was separated and churned it yielded only 288 pounds, or over 21 per cent short of the usual run. In looking for the cause it was noted that on February 1, the weather turned cold and it snowed for two days. This goes to show that dairy cows, especially, should be provided with conditions as nearly uniform as possible. Any sudden change in temperature, feed or care, may not permanently affect the per centage of butter fat in milk, but it will cause a temporary change, both in quantity and quality, and may in a large measure account for the fluctuations in the butter fat test experienced at so many of our creameries. D. H. OTIS.



Kansas Experiment Station.

Save Money and Labor by Buying

THE IMPROVED U. S.

TRIPLE CURRENT SEPARATOR

Users say it is **unequalled** for **clean skimming,** durability and ease of operation. They surely ought to know. Read a few of their letters :

The More Used the Better Liked.

RIDGEWAY, WIS., Jan. 9, 1899.
The more we use the Improved U. S. Separator the better we like it. It is as **reliable as a good clock**, and it seems to me that it will be **as durable.** It runs light, does good work, is easy to take care of, and made to last.
THOS. CONVEY, Conductor of Farmer's Institutes.

Takes Out Every Particle of Cream.

SILVINA, WASH., Jan. 2, 1899.
The No. 5 Improved U. S. Separator is all right. It is easy to turn, easy to clean, and takes out every particle of cream. We make considerable more butter and receive 2½ cents per pound more for it. It is the best machine a farmer ever bought. MAX BARTL.

Greatest Labor-Saving Machine.

TURIN, N. Y., Jan. 11, 1899.
The No. 5 Improved U. S. Separator works finely. It is the greatest labor-saving machine for making butter that was ever made. **We could not do without it.** Every farmer should have one. J. BIBBINS.

Remember that in order to have the best, the **TRIPLE CURRENT SEPARATOR,** you must buy the **IMPROVED UNITED STATES.**

Illustrated circulars free on application.

Ripening Cream in Winter.

ED. HOARD'S DAIRYMAN:—You ask for a plan for ripening cream in the dairy. Where the old-fashioned pans are used and skimmed when loppered, it is hard to ripen cream, but where the submerged cans or the modern separator is used, I think this plan works very nicely: Keep all the cream sweet until twenty-four hours before wanting to churn it; then warm it up to 62° or 65°, adding to every 10 gallons of cream about one quart of previously secured milk that has been kept from any outside taint. A nice way is, 48 hours before churning take some new milk, warm up to about 90°; place in a tight covered can in a warm place to sour; strain this into your previously warmed cream and stir thoroughly. By doing this you can always get cream into a nice condition for churning, in twenty-four hours. At churning time cool down to 62° if you churn by hand; if with a power, I would cool to 56° or 58°; then with cold water there will be no spotted butter. If I could not afford a Boyd tank, I would make me a box (large enough to hold the cream), of two thicknesses of inch boards, with an inch dead air space between. Then I would take it to the tinner and have it lined with the best heavy tin. I would make a cover to fit on in the same way; put it on legs to keep it from the floor. With such a box one can control the cream temperature more evenly. One of the difficulties with the ordinary tin can or jar, put behind the stove in kitchen or sitting room to sour, is one side of the cream is cooked, the other is cold, and off comes the cover and a stirring to mix the cooked cream with the other. You see, Mr. Editor, I know how it goes, for I have been there myself. But I learned by experience; it is a dear teacher, but sometimes it does knock a little knowledge into our heads. FARMER'S WIFE.

ED. HOARD'S DAIRYMAN:—We never had any trouble since we adopted the following way, which we had from the DAIRYMAN. We keep our cream cool (which is no job these days) till we have enough for a churning, then mix it all and warm it in warm water to 70°; for a starter put two teacupfuls of buttermilk in a five-gallon pail of cream. We do this about nine or ten o'clock in the morning and by keeping it about the same temperature all day, the cream is always thick at night and in the morning it has cooled off enough to churn. Cream from mornings milk is all right to churn next morning in this way, but we always cool it before warming it up. I should think it wrong to set the cream cans in boiling water. Put the boiler on the stove and when the water is warm, lay a stick on the bottom of the boiler, so the bottoms of your pails will not get too hot; set your pails or cans in and stir and it takes but a few minutes when your cream is warm. D. J. DE F.

Sioux, Co., Iowa.

ED. HOARD'S DAIRYMAN:—"How can the maker of dairy butter best ripen his cream in winter?" is a question in your valuable paper of last issue. I give here my method used in 18 years' experience in different countries.

Immediately after skimming, I cool the cream down to 40°, or even lower. This is very important for the quantity as well as quality of the butter. Sixteen hours ahead of churning time I put all cream together in a vessel to ripen. I have for that purpose used vessels of many kinds and material, but found none equal to one made of oak, three-fourths inch thick staves, in keg or barrel shape, galvanized iron hoops and handles, and of a size to correspond with churn. These vessels are non-conducting, and will keep the cream's temperature better than anything else I ever tried.

Having put the cream together, I now change the tactics. Before this time I have endeavored by a low temperature to keep the bacteria dormant. I now call those little friends to my aid and give them opportunity to work, by heating the cream. It is evident that the temperature to which the cream should be heated depends entirely upon temperature of room. As a rule, I heat to a temperature that, added to that of the room, will give 120° F., that is, if the temperature of room is 50° F., I heat cream to 70° F., if 40° F., I heat to 80° F., and so on. This gives a favorable temperature for the bacteria to perform their work, i. e., to form lactic acid, which in its turn precipitates the casein. I heat cream by placing a deep setting can of warm water in the barrel and gently stirring. Next I put in a "culture" or starter. Much has been said and written about starters. I have experimented with sour cream from previous ripening, buttermilk and lactic ferments supplied by the trade, but consider the best starter to be one made daily, by the dairyman. I use for that purpose an earthen vessel and fill it with skimmed milk that has been well cooled.

This milk I heat to 100°, cover with a piece of linen and put it in a warm place, on top of boiler or other suitable place. In 24 hours the milk has soured; the top I skim off and balance goes in cream as starter. Butter milk may be used, but has the objection that if there are any defects with previous ripening or churning, they are transplanted to the next, whereas, by using a fresh starter, I guard against that. The amount of starter to be used differs very much with temperature, but as a rule not over 6% should be used, and preferable to use as little as possible. Now I stir the cream and let it stand uncovered for ½ hour. Before retiring at night, I stir again, take the temperature and test to see that the ripening is progressing right; if too cold I heat again; if too warm I cool by ventilation of room; if no acid has generated, I put in more starter. Next morning when I come around, the cream is well ripened and has the churning temperature. I have successfully used this method in the northern part of Sweden, where the temperature goes to 30° and 40° below zero and the dairy was considerable below freezing point. Scrupulous cleanliness must be observed with the barrels, they must be scrubbed and steamed, and on a clear day have a sun bath.

A properly ripened cream has a thick, but even and smooth appearance, a ladle dipped into it, the cream will drop off without streaks, the casein is precipitated in minute particles, and to the taste it is mildly acid with a certain piquant aroma, which later is imparted to the butter, and which is—especially in the English market—highly appreciated.

To sum it up: Keep the cream sweet up to 16 or 20 hours before churning, never mix one churning with another until cooled to the same temperature; do the heating while cream is sweet. Sour cream does not stand heating without generating butyric acid; such a product to any extent present in butter, is very undesirable and yet so common. Butter churned from such cream has a greasy texture, often a sour taste, and will not "stand up."

In conclusion let me say that the successful cream-ripener is not he who occasionally has his cream right, but the man who, day by day, under great climatic changes, turns out a uniform product, and to do that requires a constant observation of every change in temperature, and a thorough cleanliness of place and utensils. E. O.

Cecilton, Md.

ED. HOARD'S DAIRYMAN:—Having been a constant reader of your valuable paper for years, having been in the dairy business for 25 years, I feel disposed never to give it up, as long as I can get enough to pay the subscription for it.

As I have seen a great many articles of late in regard to ripening cream, will give you my method at this time of the year, for what it is worth. Instead of cooling my cream down as I do in spring, summer and fall, when it comes from the separator, I run it directly into the same receptacle until enough for churning, which at the present time is three skimmings, being thoroughly stirred at each skimming; let it then stand for 24 hours when it is ready for churning, at the what I call the proper stage of ripeness. Churning at a temperature of 64° F. without any trouble; having sampled buttermilk and have failed to find any trace of butter fat remaining.

No doubt some may think, well his butter can not come up to the mark in quality, but will be glad to have it compared any where or by any competent judge with any butter made under different rules of ripening cream. The other three seasons of the year, I follow an entirely different plan.

Nashville, Tenn. W. D. W.

ED. HOARD'S DAIRYMAN:—Most dairy farmers, who patronize a cheese factory, have milk at home only a few weeks at most, and then usually during the most unfavorable time for successful butter making.

The result is that they put as little money as possible into conveniences for the work, and when they read of methods employed—where a separator, cream ripener, and modern churn, with perhaps motive power, other than a pair of hands are used—they fail to see wherein it applies to their particular needs.

To all such, this is humbly submitted.

We send milk to a cheese factory from the first of April to the first or middle of December, sometimes as late as the first of January, and make butter during the rest of the year

---

Exile of St. Lambert
13657.

70 per cent of the blood of this great sire of dairy cows. He now has 69 daughters that have made from 32 lbs. 6 oz. to 14 lbs. of butter in seven days—a greater record than any other bull, living or dead. Solid fawn color. Dropped July 26, 1898. His grandam made 16 lbs. 4¼ oz. of butter in seven days. **P. J. COGSWELL, Rochester, N. Y.**

THE Evergreen Farm Herd of A. J. C. C. Jerseys is now headed by St. Lambert of Brodhead, whose pedigree is unequaled in the northwest. We should be pleased to have anyone in want of Jerseys to write us for catalogue, stating just what is wanted. **N. N. PALMER & SON, Brodhead, Wis.**

(sometimes very little as the cows come fresh in March).

The milk is set in pans, two or three days, according to weather, and kept as cold as possible without freezing—also as free from all kitchen odors.

When enough cream has accumulated for a churning it is heated up to 65° or 70° and stirred constantly while heating, then set where it is cool for 24 hours.

It should then have a smooth, thoroughly mixed appearance, a glossy surface and a *slightly* acid taste, at least.

It is churned at about 62° and usually takes from 20 to 30 minutes.

The "separator" used is tin pans and a tin skimmer.

The "ripener" is a granite pan. The "churn" is an old-fashioned crock, known as a "dasher churn", and the "power" used is one of the family.

The butter made has a fine flavor, and is all around first-class dairy butter.

I might add that the cows are well fed and cared for, but no special work is done along these lines. L. G. J. R.

South Newberg, Ohio.

ED. HOARD'S DAIRYMAN:—Would say in answer to the inquiry in regard to ripening cream, that we formerely were troubled; but now have the matter under control. We think it not to be a good plan to keep cream longer than to gather a churning, and if the number of the cows is small, churn small churnings every day if possible. We warm the sweet cream to 70°, and add to five gallons of cream about two quarts of fresh buttermilk, set the can near the stove in the living room and stir occasionally. The cream will be ripened inside of twenty-four hours.

If for any reason the buttermilk is not good, we make a starter by warming a quart can of sweet skim milk, adding a teaspoonful of lactic acid starter, and when it becomes thick use it for a starter in a warmed churning. This has always been a success, since we learned it two or more years ago.

Kalamazo, Mich. J. K. M.

Questions from a Virginia Dairy.

ED. HOARD'S DAIRYMAN:—I have a herd of 28 cows and am shipping milk to a creamery four miles from my place, for which I receive 60 cents per 100 pounds during May, and months following to October 1st, for which month I get 70 cents, and for five months following to April 1st, I get 90 cents per 100 pounds, and for April, 70 cents.

What amount is it necessary for a cow to give during 12 months to pay at these prices, on following feeds: Clover hay at $6 per ton, corn ensilage $2 per ton, the whole ear left on stalk, making about 8 barrels of corn to the ton, corn meal $17 per ton, and a full supply of fodder is given them.

What I wish to know is, can a properly balanced ration be made from this food, which will produce a flow of milk sufficient to be remunerative at above figures? If the corn meal is not the proper kind of feed, will it pay to sell corn at 30 cents per bushel, and purchase some other food, which you can name to be used in its stead. We can graze for about six months in the year, and consequently have to feed six months.

Now, from the foregoing data, will it be best for cows to calve during grazing or feeding period?

Which will pay best, milk at above prices, cream at 60 cents per gallon, or butter at 15 cents per pound? If you advise cream or butter, I suppose it would be best to buy a hand separator, and if so, what make would you suggest, and which would be about the cost of one best suited to my wants?

I have recently subscribed to your valuable paper, and wish to derive the greatest benefit possible from your knowledge and experience.

It might be well for me to state that labor costs about $10 per month, board and lodging furnished by the employer. What number of cows can an average milker handle properly?

By answering above questions, you will greatly oblige B.

Orange Co., Va.

We estimate that it would require, at the prices named, about 4,000 pounds of milk per cow, to pay for her feed and care, but may say that we consider the price allowed for milk, if it tests 4 per cent fat or more, very low, more especially if the skim milk is not returned. One hundred pounds of 4 per cent milk should make 4½ pounds of butter, and very nearly 2 gallons of cream. Hence cream at 60 cents per gallon would be the most profitable.

With corn at 30 cents per bushel, corn chop, (not to say bolted meal) should not cost to exceed $12.50 per ton. This is relatively cheap, but it would not, by itself, make a satisfactory ration with the silage, clover hay and fodder. We suggest, as an indication of about what these cows should receive, as an average daily allowance, the following:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
25 lbs. silage	6.60	.33	3.50	.18
10 lbs. clover hay	8.47	.68	3.58	.17
10 lbs fodder	5.95	.17	3.24	.07
2 lbs. corn chop	1.78	.16	1.33	.09
2 lbs. bran	1.76	.25	.77	.06
2 lbs. cotton seed meal	1.84	.74	.34	.24
Totals	26.40	2.33	12.76	.81

In a herd of 28 cows we should aim to have about two-thirds of them freshen in September and October, and the others at different times throughout the year.

A separator would be a necessity, but we cannot pretend to advise which one of the several makes to purchase. In the circle of our intimate friends there are some four or five kinds in use, and each man is very confident that his particular machine is the best. If the fact was, therefore, that we had a personal preference for one, it would be unfair to the others for us to express that preference. Various tests made at the experiment stations have demonstrated that there is much less difference in separators than the promoters claim. And it may be said further, that while it is quite possible to operate one of these machines by hand, it is much better to have some sort of power. On the writer's farm a dog furnishes this power, and seems to enjoy the job. Write to the various advertisers in this paper for terms, etc.

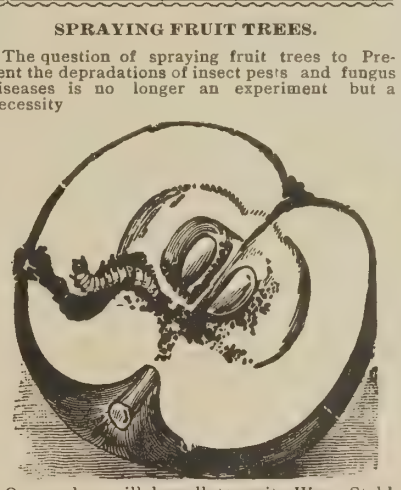
An average milker should easily "handle" 8 to 10 cows.

A City Milkman's Experience.

ED. HOARD'S DAIRYMAN:—I used to be a constant reader of the DAIRYMAN, and think it a good paper for the dairymen that makes butter or cheese, and, in fact, that produces milk in any way or for any purpose, and the only reason that I dropped it from my list of reading matter was because I did not have any, or, at least, not much correspondence on my particular business—that is, city delivery.

I have furnished my town of 2,500 inhabitants for the past five years in milk, and I am going to give you a history of my business.

In the first place, I had studied a long time, being a farmer, what a man on a farm could do to have a daily income, realizing the fact that there was a gradual outlay or expense every day on the farm, as well as any other business, so I concluded to start a city milk wagon. It had been tried several times by other parties and failed only for one reason, which I will discuss later on. But five years ago, on the 5th of December, I started on my route and there was a good deal of comment one way and another, but we went into the business not knowing the situation and how the town was already supplied so that we have had to contend with the one cow peddlers. The wealthy men of the town, doctors, lawyers, merchants and nearly all professional men, were peddling all but a pint of milk from their cow; but we continued our business, put milk down to a low figure, furnished nothing but first quality and when they found we were here to stay, then the talk was: "Well, you had better not patronize the milk wagon. He will be just like those other fellows, he won't stick to it." But we haven't missed a single day in those past five years—Sundays not excepted—and now these same one cow peddlers will go to the restaurants and hotels and say: "Here, we will trade this milk all out, if you will buy our milk."



Now, this is the worst thorn in the milkman's side, he has to contend with. I think that we ought to have a license on every cow in the town, or on every cow that the owner sells milk, and then if the lawyers and doctors want to pay a license, let him sell his milk, but I will say that until there is something of this kind, that no man can start a dairy, keep it up to date and compete with those fellows that will trade their milk for luxuries at the restaurants and lunch counters.

To the milkmen of small towns and cities: I know you all have this to contend with and I would like to correspond with all that are interested in this matter along this line of dairying. I have a hired man that is reading the DAIRYMAN, and if I can see better articles on my case and how to handle the milk to give satisfaction the year round, I will be glad to do so. U. A. TOWNS.

Harrison Co., Mo.

SPRAYING FRUIT TREES.

The question of spraying fruit trees to Prevent the depradations of insect pests and fungus diseases is no longer an experiment but a necessity

Our readers will do well to write Wm. Stahl, Quincy, Ill., and get his catalogue describing twenty-one styles of Spraying Outfits and full treaties on spraying the different fruit and vegetable crops, which contains much valuable information, and may be had for the asking

COMMON SENSE MILK BOTTLE.

Consumers of milk in every town and city demand their milk in bottles—the only safe method of milk delivery. **The COMMON SENSE BOTTLE** with the chemically prepared paper cap is the only practical bottle, and has superseded all others. All genuine caps have printed on them in ink, "Pat. Sept. 17, 1889."

CHAMPION HERD
AT NEW YORK STATE FAIR,
1898, in competition with the leading herds of the country, won eight firsts and sweepstakes. Young stock by **COMUS**, sire of most of the winners, for sale. Thoroughbred Poultry—the best egg-producing and general purpose varieties—Leghorns Wyandottes, Buff Ply. Rocks, Houdans. Send for circular. Stock for sale. J. FORSYTH,
Riverside Farm, Owego, Tioga Co., N. Y.

Florham Guernseys.
I offer at attractive prices **TEN BULL CALVES** from one to seven months old. Most of them were imported in dam and are of the best English and Island strains.
J. L. HOPE, Farm Supt., MADISON, N. J.

GUERNSEYS.
225 Pure Bred Guernseys,
Of the best American and Island breeding. Butter average, whole herd, 318 lbs. per head. No catalogue. Come and make your own selection.
ELLERSLIE STOCK FARM,
Rhinecliff, N. Y.

MILLWOOD FARM
Guernseys!
Guernseys of All Ages and Sexes For Sale.
Bred from Tested Dams. All animals have been tested with tuberculin and certificate of same is provided with each animal.
N. I. BOWDITCH, Framingham, Mass.

AYRSHIRES Finely Bred and from the very best families. Stock young and old for sale, bred for milk and butter qualities. Also fine herd Chester White Swine. Correspondence solicited. FRED TSCHUDY & SON, Monroe, Wis

New York State Dairymen's Association Meeting.

ED. HOARD'S DAIRYMAN:—The 22nd annual meeting of the New York State Dairymen's Association was held at Gouverneur, St. Lawrence County, Wednesday and Thursday, Jan. 25, 26, Mr. A. R. Eastman presiding as President. There were six sessions, and, never before in the history of the venerable association have so many noted speakers trod the boards at its annual meeting, nor the attendance nearly so large. Audiences varying from 500 to 800 in number, faced the speakers at every session; the number at the last one, despite the fact that a howling blizzard was in full swing outside, being fully as large as at any of the former ones; but not a man, woman or child left their seats until the curtain fell on the last act, Major Henry E. Alvord's paper, the reading of which did not conclude till 10 o'clock, Thursday evening.

The program, which, with one exception, was carried out as printed—Prof. I. P. Roberts, of Cornell, who was scheduled for an address at the Wednesday evening session, being changed to the second session—was as follows:

WEDNESDAY MORNING.

Address of welcome, Mr. Edwin Dodge, of Gouverneur. Response, Jared Van Wagenen, Jr., Lawyersville, Schoharie Co. The President next appointed the regular committees, after which he read his annual address, supplemented with a few general thoughts which were very appropriate, coming, as they did, by inspiration caused by the great audience that greeted him as well as by the immense number of exhibits of butter, cheese, and the dairy machinery in the two large halls under the Opera House.

The Committees were as follows: On Resolutions: Dr. L. L. Van Slyke, Geneva; C. M. Lamont, Owego; F. E. Dawley, Fayetteville. On Nominations: W. W. Hall, Gouverneur; H. E. Cook, Denmark; Geo. A. Smith, Frankfort; S. Brown Richardson, Lowville; and Jared Van Wagenen, Jr., Lawyersville.

AFTERNOON SESSION.

Music—Instrumental. Address, "Forage and Fertility',, Prof. I. P. Roberts, Cornell University, Ithaca.

Illustrated address, "Conformation of the Dairy Cow", ex-Governor W. D. Hoard, Fort Atkinson, Wisconsin.

EVENING SESSION.

Address, "Dairy Bacteriology", Prof. H. H. Harding, of the State Experiment Station, Geneva. It had been scheduled for the afternoon session but was changed to accommodate Prof. Roberts, who had an engagement with the Western New York Horticultural Society, Rochester, which was then in session. Dr. Van Slyke read an excellent and instructive paper, having for a text, "Food Adulteration". There was also an entertaining musical favor, consisting of a tenor solo with accompaniment of three violins and cello, artistically played.

WEDNESDAY MORNING.

Menu was as follows: Vocal selection. "The Cheesemakers"; paper, "The Patron's Relation to the Cheesemaker"; H. E. Cook, of the New York Farmer's Institute Force, Denmark; address, "The Construction of Curing Rooms, and the Curing of Cheese", H. H. Dean, of the Dairy Department of the Ontario Agricultural College, Guelph, Ontario, Canada. Discussion.

AFTERNOON SESSION.

Vocal quartette. Address, "The Experiment Station as a Factor in Dairy Progress", Prof. W. H. Jordan, Director of the New York State Experiment Station, Geneva; address, "Reducing the Cost of Production", ex-Governor Hoard.

LAST SESSION.

Vocal music. Address by Major H. E. Alvord, Chief of the Dairy Division of Agriculture, Washington, D. C.

Owing to the length of the various addresses and papers, the question box exercise and very much of the proposed discussion on the program was ommitted. "More discussions and less talk", said an old dairyman to me, "would have suited my purpose better." But, there is always more or less criticism, at such meetings, and, no doubt but some one would have kicked had the Savior been present and preached again his "Sermon on the Mount."

The program so extended, the subjects discussed so varied, the DAIRYMAN'S space and my time so limited, no attempt was made to report or condense any of the proceedings; but I am able, through the courtesy of the secretary, Mr. S. Brown Richardson, and Mr. Ellis Woodworth, superintendent of exhibits, to give you the resolutions adopted, the scores of butter and cheese, and the names of those exhibiting dairy machinery. The latter list was as follows:

Vermont Farm Machine Co, six sizes of separators, from 250 to 3,000 pounds of milk per hour; improved largest size cream vat; large square churn, 300-gallons capacity; latest improved "Ageas" milk tester; butter carriers, butter printers, dairy churns, butter workers, and Babcock testers, and Williams' improved sap evaporators; also dog or sheep tread powers. Mr. R. J. Sanford was the representative.

D. H. Burrell & Co., Little Falls: Five cream separators of the "Empire" model; capacities from 160 to 3,000 pounds. New patent gang cheese press adjusted for hoops from twelve to sixteen inches diameter, with continuous pressure blocks, operated by lever power, "Facil" Babcock testers for hand or steam power, and a full line of Hansen's extracts and colors.

St. Albans Foundry Co., represented by E. W. Hoyt, Stamford, N. Y., Baley Jr. tread powers and one horse tread powers, five lines, from dog to four horses. The firm also manufactures a full line of threshers, and drag and circular saws; also ensilage shredders and cutters. A sample of shredded ensilage sixteen months old, from Mr. Dawley's silo, and in perfect condition, was on exhibition, which was not acid to the taste nor gave off any offensive odor.

Mosely & Stoddard, dog powers, Stoddard pasteurizing vat, and Facil Babcock testers—both hand and steam power. Represented by E. J. Parker and F. E. Benedict.

Diamond Crystal Salt Co., St. Clair, Mich., by H. W. Dewey, Sidney Centre, N. Y.

Sharples Cream Separator Co., four machines, including their new tubular machine, just out; capacities 300 to 2,500 pounds milk. Russian Babcock testers. Elgin Babcock "No Tin" tester, with boiler and engine complete.

Thatcher Manufacturing Co., Potsdam, N. Y., represented by L. L. Barnhart, and G. G. Gilbert, full line of milk dealers' supplies and butter colors; samples of butter exhibited showing the difference in the effects between aniline and vegetable colors, the vegetable being of a light straw color; that colored by aniline having a pinkish color. There were five brands of butter color on exhibition, four of aniline and one of vegetable.

Worcester Salt Co., by E. L. Mills, eight different forms of packages.

Fuller's Curd Mill, Fred B. Fuller, both hand and power mills.

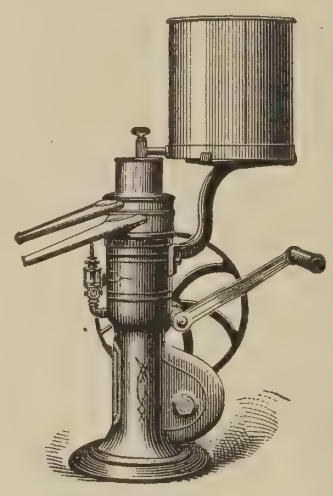
Genesee Salt Co., by E. B. Willey, thirty different forms of packages.

Wells, Richardson & Co., by D. F. Davis.

Indurated Fibre Ware Co., Cooley & Hays, N. Y., by F. W. Bosson, fibre butter packages, in one of which was an exhibition of butter made by A. M. Woodward, of Rodman, N. Y.

The Bennett & Millitt Co., pioneer clover meal, Gouverneur, ground clover for calves and chickens—an attractive and new feature at such exhibitions, and which occupied one-sixth of the floor space in one hall. This poultry food was highly endorsed by a number of chicken men present. Samples will be sent free to any applicant. The exhibit was represented by the members of the firm.

DeLaval Separator Co., N. Y., full line of Alpha and other machines, testers, etc. Represented by J. J. Berrigan.



Pohl's Automatic Curd Agitator, by J. Fred Schlappie, manufactured at Vernon, N. Y. only one size, but endorsed by all the expert cheese makers of New York. Gov. Hoard, upon examining the working model, expressed the opinion that it was an excellent device for agitating cheese curd.

Oaks & Burger, Cataraugus, New York, Jacketed cream cans, tinned steel, cheese hoops, etc., by E. G. Dretrect; E. G. Elliot & Co., parchment paper lining for butter packages; Champion Milk Cooler Co.,

All The Prize Winners at Sioux Falls Used "The Kind That Has No Mud."

Cortland, N. Y., two sizes of coolers shown; also Page Woven Wire Fence Co.'s goods. Door mats, fence wire, ornamented work for yards and cemeteries, gates, etc., by C. W. Waterman, Spring Lake, N. Y.; Alderney Butter Color by the Heller and Merz Co., N. Y., a large number of samples.

There were some other exhibits of minor things, but, the men having them in charge, had gone to the "show" leaving them to advertise themselves, and do their own blowing. Hence their omission. But Mr. E. J. Willey, representing the Smith Lee Co., of Canastota, showed a unique cap for milk bottles, which is cheap in price, being made of especially prepared paper. It seals the bottle perfectly, will not break when being taken from the neck of the bottle; may be withdrawn by the thumb and fingers; is easily cleaned and may be used several times before becoming useless.

In one of the exhibition halls was a novel and very beautiful exhibit of butter; being of highly artistic designs. It consisted of a house, its upright or main part being 18x12 inches, with an "L" 6x10 inches, with piazzas, chimneys, pillars, cellar walls, windows, blinds and doors, also door steps. In short, everything was complete, it being a perfect representation in miniature form, of Mr. L. W. Dryer's house, in Cumberland Centre, Maine.

The main portion of the house was of two stories, the "L" or wing part, one and a half stories. Another unique exhibit was a representation of the battle ship Maine, as she appeared with her smoke stacks, funnels, guns, and boats, before she was blown up There was also a bust, about half size, of Mr. Dryer, made from a photograph which stood beside it, that showed great artistic ability on the part of the sculptor, if he may be called a such, as it was as near perfect in form and feature as human hands could fashion it. Even the eyebrows, eyewinkers and mustache were worked out in hair lines to perfection.

A large eagle nearly half size, with a small American flag flying from a pole thrust into his head, stood near the bust, and beside him a mirror lying on the table on which were butter ducks and swans. Their position on the mirror gave a perfect representation of so many birds sitting at rest on some smooth glassy lake.

Another beautiful exhibit was a large group of yellow roses, full size and beautifully arranged, from the Hermitage farm, Providence, R. I. Miss C. E. Williams, of Bowdingham, Maine, was the artist who made the battle ship and roses.

This beautiful exhibit was sent at the request of our association, by the Maine Department of Agriculture, having been first exhibited at the Maine Dairymen's convention at Portland, last December. The color was that of light straw, and, notwithstanding its age and long shipment, there was not a defect in it. But one could see here and there, in the mouldings of the cornice and the door and window casings, a few fine particles of salt. That was all the effect of age to be discerned.

The whole exhibit ought to have been photographed and framed for use by the state association at its regular annual meetings.

In my next, I will send list of scores, together with the resolutions adopted.

Belleville, N. Y. C W. JENNINGS.

Building an Oval Silo.

ED. HOARD'S DAIRYMAN—Your correspondent, J. B. Early, asks respecting a silo he proposes to build, "Are there any such silos in use in the East?" I beg to say that I have built a similar one within a year. It is oval in shape, the extra length being about 24 feet and its width 13 feet; its height is 30 feet. It occupies one of the bays in my hay barn—though it projects outside the barn about 6 or 7 feet. I put in a substantial foundation of stone, on which a sill rests. The studding is 3×4 feet and spliced in places. The sheeting is of spruce ½×5, put on laterally. The sheeting is placed on both sides. After a few feet of sheeting had been nailed, I had three thicknesses of the best tarred paper put on, and then another course of the sheeting. The whole of the inside of the silo was carried up in this way, the joists, of course, being carefully broken in the laying of the second course. The bottom of the silo is of cement. The outside of the silo which projects from the barn, is sheeted in the same way, except that but one thickness of sheeting is used. The only object of this outside sheeting is appearance, and the protection of the studding. The silo is tight enough. without it. In the lower outside sheeting strips, I have occasional holes bored to let air pass up between the sheeting and studding, and so prevent decay. The silo was filled in September, and the ensilage is all I can desire. I do not remember ever to have seen a more satisfactory silo, and I hope Mr. Early will get as good a one, or even better, if that is possible.

C. L. HUTCHINS.

Punkatasset Farm, Middlesex Co., Mass.

Some Alfalfa Questions.

ED. HOARD'S DAIRYMAN: —1. Would you, or some of your readers, who have had experience in handling alfalfa or clover for ensilage purposes, state through the columns of your valued paper, what method of handling, from the standing crop to the ensilage cutter, they have found to work most satisfactory?

2. We sometimes are troubled with cows bloating on alfalfa pasture. Is there any similar trouble when alfalfa is fed as silage?

You may think these questions very trivial, but for one who has had no experience in handling silage, in fact having never seen but one silo, they are as pertinent as any that in my ignorance would seem to interest me most. YOUNG FARMER.

California.

Cupid's work is done when the baby comes. The soft, little, clinging, helpless mite is the crown of love. Its coming marks the completion of Cupid's object. Cupid brings two loving souls together—the baby holds them together.

A woman is never so womanly, so beautiful, so happy as when she is a mother. Yet motherhood is denied to some women and feared by others.

The fear of motherhood is rapidly passing away and nothing has done so much to drive it away as the record of Dr. Pierce's Favorite Prescription.

Dr. Pierce has held that danger and pain at the time of parturition were really unnecessary and unnatural, and that if every woman were healthy and strong as Nature meant her to be this function would be performed painlessly and safely. The abuse of centuries of corsets—of health destroying inactivity—of debilitating artificial life have made it impossible for some women to fully return to the perfect healthfulness of a natural state but every woman may be helped to a large degree. The organs directly involved may be strengthened, purified, invigorated for the time of trial and for this purpose Dr. Pierce's Favorite Prescription has been used with success by hundreds of thousands of women. It is the product of the skill and experience of a regularly graduated physician—a skilled specialist who for over thirty years has successfully treated the diseases of women.

Unlike many modern medicines Dr. Pierce's Favorite Prescription contains no whisky, alcohol, sugar, syrup, opium or narcotic of any kind and its use does not, therefore, create a craving for stimulants.

Mrs. Annie Blacker, of 629 Catherine St., Syracuse, N. Y., writes: "Your medicines have done wonders for me. For years my health was very poor; I had four miscarriages, but since taking Dr. Pierce's Golden Medical Discovery and 'Favorite Prescription' I have much better health, and I now have a fine healthy baby."

Six Tools in One.

Remove one bolt from the "PLANET JR." No. 4 Combined Drill, and in a minute you can have a perfect Wheel-hoe, a Cultivator, a Rake, or a Plow, as you please. The drill drops in hills at any distance apart, or sows perfectly in drills, as desired. SIX TOOLS IN ONE—and each the best tool of its kind made.

This quick adaptation to the work is the great feature of all the "PLANET JR." tools—hand-drills, wheel-hoes, horse-hoes, and two-horse tools. The swiftness and cheapness of their work are the secret of farming success.

The new "PLANET JR." Catalogue for 1899 not only describes all these wonderful tools, but includes also SIXTEEN FULL PAGES of fine photographic views—interesting field scenes in France, New Zealand, etc., showing the different crops and methods of cultivation with the "PLANET JR." tools at work. Write us for a copy; it's sent free.

"PURIFINE" A BOON TO THE GREAT DAIRY INTERESTS.

A POWERFUL Disinfectant That is ODORLESS, NON-POISONOUS. Used in Creameries, Cheese Factories, Dairies and Stables.

IT DOES NOT Create an Odor to Destroy One.

SAN FRANCISCO, SEPT. 22nd, 1896.
I have used "Purifine" in cleansing milk cans and bottles and find it will remove the bad odor left by old sour milk more effectually than anything I ever tried.
E. A. GREEN, Sec'y,
Millbrae Dairy Company, Mission & 9th.

Applied with large quantity of water, which makes it cheap and convenient of use. It is invaluable to the cleanly dairyman or factory operator. Once try, you'll never be without.

SEND $1.00 FOR SAMPLE GALLON by Freight.

This powerful disinfectant creates no odor of its own, but will keep creamery, cheese factory and dairy pure and sweet. TRY AT ONCE.

FITCH CHEMICAL COMPANY, Bay City, Michigan.

ILLUSTRATION.

This picture is a rough sketch taken from one of the full-page photographic views in the new "Planet Jr." catalogue for 1899. It shows how they raise onions by the ship load in Yankeeland; and it rather takes one's breath away to think of one onion grower investing in twenty drills just for sowing the seed.

The "Planet Jr." catalogue for 1899 is full of pictures like these: Farmers and farmer's sons, and farmers' wives, and "their sisters, and their cousins and their aunts," will all want to have a turn at this interesting pamphlet; for it shows views of farm scenes all over the world with the different crops and methods of cultivation, and the oxen and horses, and other kinds of motive power. Of course, it's an advertisement; that's what it's made for; but it's one of the best advertisements that we have ever seen, and one of the most interesting that any farmer is likely to get hold of. You can get a copy free by sending a postal to S. L. Allen & Co., Phi'adelphia.

Comments and Queries from Robinswood Farm.

Paper No. III.

ED. HOARD'S DAIRYMAN:—I observe that if one has patience, his quest for information, as a rule, is answered in HOARD'S DAIRYMAN, in time, without undergoing the trouble of formulating questions. Some one of its readers or the editor seem to know and anticipate one's queries. But in all the matter relating to silo coverings, no one, so far as I know, has brought forward the method we use at Robinswood farm. We cover the ensilage with a single layer of boards, then cover the boards with lapped layers of glazed (pitched) building paper, held down with a little loose hay. The result is that we have, practically, no loss of ensilage. When the ensilage is uncovered for use, the hay is fed out, the building paper is rolled up and saved for the next season, and the boards stored away on the timbers at the top of the silo. I don't know if any one else has used this method, but it seems about perfect. The building paper is not the tar smelling kind, but is impervious to air and moisture. We also use it in between the two layers of boards lining the silo, which is square and built in the barn bay.

We take care to see that the chopped ears, as they fall from the carrier, are shoveled equally over the surface of the ensilage, and that the sides and corners are trodden very firmly. We grow our ensilage corn in hills, planting about nine grains to the hill, and cultivating both ways. Taking everything into consideration we judge that this is the best way. The stalks are heavily eared, and there is probably about the greatest amount of concentrated digestible nutrients grown to the acre in this way. If grown in rows, with stalks about eight inches apart, there would be produced a larger total of food, but it would not be so concentrated; the labor of culture and cutting slightly more, while the extra cultivation shows in the corn and subsequent crops. We have found an early maturing local variety gives the best result. A neighbor evolved it by a process of selection, running back over a period of fifty years. It makes a rich feed, and in connection with clover hay and oat hay, little or no grain need be bought.

When I look at the smallness of the butter-fat checks received, and the bigness of grain bills, there are terrible doubts arise in my mind, and I appeal for light. I don't find it even in that remarkable compendium of information "Feeds and Feeding." The question that is of importance for me, and of vastly greater importance for the farmers who are sending in milk to the Gilmanton creamery, to settle, is as to the nature of the food we shall feed our cows. This is of more pressing importance than the question of the nature of the cows to be kept in the future.

Query 1st. Will it pay the New England farmer to buy, in hard cash, digestible nutrients at prices prevalent, when butter fat returns eighteen cents net per pound on an average?

Query 2nd. Will it pay to buy protein for ration balancing purposes, under the same conditions, and only considering the returns in cash from butter, skim milk products, as pork, veal, etc?

I take it for granted that if the fertilizing value of the nitrogenous foods can be utilized in auxiliary products, such as apples, potatos, beans, hay, etc., such purchases will pay; but how is it otherwise? If a man is turning his labor into cash through the agency of the dairy cow, it behooves him to grow those crops that will, so far as possible, give well balanced rations; but is it going to pay him to spend his money to secure the most perfect balance, and to increase the amounts of digestible nutrients?

Query 3rd. Where is the golden mean in supplying nutrients which can be converted into milk?

Query 4th. How far should the production of milk be pushed in breeding stock for the best good of progeny? It is certain that every ounce of digested nourishment absorbed results in a certain amount of wear and tear on the liver, kidneys, mammary glands and other organs of the cow. Any amount of nourishment absorbed over and above what is needed for the production of the anatomical structure of the cow, and its physiological functions, including respiration, milk production and other glandular work, must result in plethora, undue wear and tear on the organs of excretion, and induce disordered conditions of one or another kind. But we are to understand that it is good economy to supply nourishment in quantity up to the greatest milk production, but stopping short of plethora.

Query 5th. What is the nourishing constituents of the natural upland hay of the New England hill regions? Some redtop grows in moist spots; but the bulk of it is what the local farmers call white top. Is this a variety of redtop? I do not find any mention of whitetop in the books. There is quite a large amount of witch grass in cultivated lands; but this so called whitetop seems to be the natural grass of the region. It will go on growing and bearing moderate crops indefinately on our hill fields. Its elements must be the equivalent of the mineral decomposition of the granite rocks, and the nitrogen and ammonia washed out of the atmosphere by the rain and snow. There are probably not a dozen nitrifying microbes to the square acre of these old grass fields, from which all evidences of artificial manuring has disappeared. At all events the hay from this grass constitutes the bulk of the fodder of the Gilmanton farmer, and it is of importance to know what is needed as an addition to balance it for milk production. When land gets to be of enough value to remove more of the rocks from the soil, clover will take a larger part in the feed for cows in this region, in place of this fodder. Here and there we find examples of those who clear a piece of land of stones near the barn and grow silage corn on it every year.

Query 6th. To what extent ought the advocacy of dairying, as an industry in the United States be carried? What is going to be the outcome of all this creamery establishment and cheap scientific cow feeding? The price of fine butter is very low now. There are parts of the county, like our Gilmanton region, that are fitted for nothing else. But what is to become of such regions if the farmers of the flat, easily cultivated lands of the county, go into dairying? It would seem as if the sandy soils of the lower half of the state of New Jersey could cheaply produce all the corn ensilage and clover to make the butter for the whole world. Electricity and other locomotive power is steadily reducing the demand for horse fodder. Is all of this to go into butter and cheese? Ought not the owner of the more easily tilled soil be induced to adopt systems of culture, producing crops in which the agency of the cow is not to be considered as profitable? The cotton raiser certainly does not need the cow as a means of soil renovation; nor does the grain grower or fruit farmer. Crimson clover plowed under would probably be a cheaper means of bringing up land for many farmers, than corn and ordinary clover fed to cows. Whatever policy the farmer of other parts of the county may adopt, the New Hampshire hill farmer has got to milk cows or go to the wall. J. M. W. KITCHEN, M. D.

New Hampshire.

On page 980, of the last volume of the DAIRYMAN, our correspondent strongly advocated the use of the scrub cow for the scrub farmer and the dual-purpose cow for the man who was more advanced in dairying and claiming that such animals would be found more profitable for such men. Now our correspondent has doubts when he compares the smallness of the butter fat check and the size of the grain bill. The DAIRYMAN would suggest that such ratio will continue so long as the Gilmanton dairymen continue to feed expensive grain to dual or general-purpose animals.

A man will think twice before he will buy a stove that will waste fuel, but he will think nothing of wasting a ton of feed on an animal that can return but a small part of its value, consoling himself with the prospect of a few extra pounds of cow beef at the end of her usefulness as a dairy animal, losing meanwhile many times the value of the added beef in butter fat.

We would suggest to our correspondent to examine his cows first and see if there is not the cause of the adverse ratio between butter fat and feed.

VETERINARY.

Queries in this department answered by WM. HORNE, M. D. V. S., Janesville, Wis.

COW PHYSIC—Three-fourths to 1¼ pounds Epsom Salts (according to age and size of animals) and two ounces of best ground ginger. Pour over this three pints of boiling water. When at 105° F., give gradually as one dose.

MANGE.

My cows have a white scab on their neck and sides and shoulders, some as large as a half dollar, and about one-eighth inch in height. Can scratch them off with the hair then the skin looks bloody. It seems to be contagious. A. W.

Minn.

ANSWER.

Tar soap, one ounce, fish oil, one quart, thoroughly mix and gently rub in well three times a day.

It is to all intents contagious, so separate the affected at once, and thoroughly disinfect all and everything possible. Be careful of your hands, they may become infected, and others too.

CHRONIC CONSTIPATION.

I have a sick cow. She is constipated. I have given her salts several times, but in a day or so she is just as bad as ever. Her droppings are hard and coarse, almost like horse manure. She don't chew her cud. She is getting thinner every day. I tried to feed her bran with a little ground flax seed in it, but she would not eat it. Her milk has almost entirely dried up. She has been this way for over three weeks. J. F.

California.

ANSWER.

If large, give the cow six drams of podophyllum each morning and two drams of fluid extract of dandelion in six ounces of water. This is a direct, certain, and powerful hepatic. There is no doubt but the cow is afflicted with a torpid fever. Feed sloppy food continuously for awhile. Give the medicine for three mornings, then rest two days, then repeat two doses, then 4 drams a day until the bowels are free.

SPOTS ON PLACENTA.

I had a two-year-old heifer come fresh on the 12th inst. about eight days after date for calving. Calf came all right, the placenta to, both inside of an hour, but the placenta about one-third of it, the last third, was covered with spots of something like lean meat, soft and livery; some of them were 2in.x4in. in size, some one inch but dotted over with these on outside; placenta seemed extra thick where spots were. J. F.

Amery, Wis.

ANSWER.

I have nothing to explain. I expect the lean meat you speak of was, no doubt, the cotyledons, and the cow being fat they were larger and softer, etc. This is all I can explain.

PARALYSIS OF OPTIC NERVE.

I have a half blood Jersey cow, 8 or 9 years old; dropped calf in October 10th. Gave her usual amount of milk until in December, the first night, I had to stall them. Gave them

ROUND OR FLAT FINGERS. Which are Best?

NO GOOD JUDGE decides a case until BOTH sides have been heard. Neither should YOU. Read and BELIEVE all that other manufacturers say of the value of a GOOD weeder in the field, but before buying ANY weeder see what WE have to say about

BREED'S new "VICTOR" WEEDER with ROUND FINGERS,

then decide in favor of the one you think is best AND BUY IT.

Twelve years of PERFECT success with ROUND FINGERS enables us to

GUARANTEE that our "Victor" Weeder will do BETTER work in ALL crops and EVERY spot and place than any other shape or make, and that they will do GOOD work where others will not work at all. When one does not do so it may be returned and we will refund the entire cost to you.

Agents wanted everywhere. First Weeder in a town at special price, and you have the agency if you want it. Write TO-DAY for our circulars. THEY MAY SAVE YOU DOLLARS.

THE Z BREED WEEDER CO.,

265 Merchants Row, BOSTON, MASS.

sorghum cane. (This is my hay). Next morning she had scours and would not eat grain. At noon was blind and has been ever since; in two days she seemed to lose all use of her hind quarters. J. B. W.
Brownwood, Texas.

ANSWER.

Looks to me like paralysis of the optic nerve, but are not quite certain. You need a practical man to doctor the cow. As a faint hope of help, squeeze into the lower lid of the eyes, tincture of arnica and tincture of opium, equal parts. Pull the lid out a little, and gently squeeze a small part of sponge which has been soaked in the mixed tinctures, twice a day, for a while.

CANNOT GET WITH CALF.

I have a young cow that aborted last winter. She can't breed and is a very good cow. I would like to get her cured so I could get her with calf. G. S. W.
Whatcom Co., Wash.

ANSWER.

Read the ads. in the DAIRYMAN and select the best medicine you feel inclined to choose. There are several, all of which are especially prepared for failing to breed. Such is the best, simplest and easiest method to suit your purpose.

REMOVING WARTS.

How can I take the warts off a cow's teats?
McKeesport, Pa. W. J. R.

ANSWER.

Tie a piece of tow, sponge or cotton batten, to the end of a pencil-sized stick, dip this into butter of antimony, and touch each wart twice a day until not needed; alternate this with nitric acid. Be careful not to touch any other portion of the udder. Keep off your hands, clothing, etc., etc.

DIFFICULTY IN CALVING.

I had a grade heifer, 23 months old, due to calve. She was in fine condition and well formed. I saw she was having trouble and made an examination and found the calf completely turned around, with hind legs doubled under and the hocks interfered. I sent for a veterinary and he said he did all he could and it was impossible for him to turn the calf or to draw the hind legs back, and said the only recourse was to cut the calf's legs off, and in all probability the cow would die, and he advised killing her. What I want to know is what to do in future if anything happens like this. I did as surgeon advised and killed her. W. F. D.
Bellfontain, Mo.

AFSWER.

Can't tell you. You need a practical, skillful person always for such difficult operation. None other should make the attempt, as such is always a difficult business, requiring good judgement and experience.

WORMS IN MARE.

My mare has worms, or at least one occasionally passes her bowels. They are from two to four inches long and taper from head to tail. The mare rubs the hair off her rump each side of her tail, and bites the manger, wagon tongue, neckyoke, etc.
Corydon, Pa. R. H. D.

ANSWER.

Your worms are the Ascarides, called pin worms, needle worms, etc. They inhabit the rectum and are out of the reach of medicines by the stomach. Inject the following: Fish oil, one pint, common turpenpine, one oz. only. This is to be violently shaken at each time immediately before using and keep the stuff from spilling upon the outside, or it will cause unpleasant irritation to the horse. Use this one day, then upon the next day, a strong solution of aloes. You will need a long nozzled syringe so as to reach well into the rectum.

STALL FOR COW SERVICE.

In your last issue of the DAIRYMAN I saw in your veterinary columns something in regard to stocks in which to place cows for service. They are not used around here. Will you please give in your paper a description of them? A READER.
Thetford, Vt.

ANSWER.

A good, large crotch of a tree, three feet in the ground, and a ring beyond to tie to, whilst the cow is in the stock. Have two side pieces, five feet long of hard wood, perfectly rounded and smooth, and fixed to two 3½ foot posts at the hind end, to which the side pieces are to be halved, half mortised. I kept two bulls for town service for over twenty years and never allowed either bull to be worried and fatigued by a rampant cow.

FALLING OFF IN MILK.

One of my cows is all out of whack; was fresh four weeks ago and milking better than 40 pounds per day when I bought her, one week after she was fresh. She continued to milk good for one week. The flow reduced to about half in a few days and is since reducing.

I had a competent veterinary prescribe for her, but admits that he don't understand why she don't yield to his treatment. She eats what hay and bran, ground oats and oil meal I give her, but has no thirst to speak of, therefore drinks very little. She has no fever, but looks very empty and has a tired look. Her dung comes in layers; there is a coating on the layers or between, like fine glue. SUBSCRIBER.
Grand Forks, N. Dak.

ANSWER.

If large, 1½ pounds of Epsom salts, 2 ozs. of ginger, 4 pints of boiling water poured upon this, and when at 104° give gradually as one dose. Put half a dram of nux vomica in the physic. Give all the salt she will eat for awhile. In six days give one dose of the same physic with the nux vomica. Don't clog her by forcing food upon her.

ANTHRAX.

I have had some sheep, one year ago I had one calf with them, two sheep were taken sick. I killed the sheep and buried them, then the calf took sick and I sent for a veterinary to come to my place, he told me he thought it was anthrax, and said I should kill the calf and bury deep, which I did. He said it was necessary to vaccinate all my stock, and if any more get sick I should have to call on the state veterinarian. He vaccinated all my stock twice at intervals of ten days or two weeks. Would it be necessary to re-vaccinate again next spring, as I bought one quite valuable bull and several cows last summer? I tore mangers and everything up and burned them, and whitewashed that stable twice since. C. R.
Sheridan, Wis.

ANSWER.

I believe vaccination to be through with. Bad colds will produce almost any form of disease, but your cows had passed the stage, which usually indicates a bad cold only. I don't like to antagonize or find fault with the opinions given. I have little chance for a correct diognosis. I would advise you to get the state veterinary surgeon as your best course.

NOSE BLEED—MANGE.

I bave a full blood Jersey, thin in flesh, that I bought this winter. Took good care of her, but she got off her feed but was all right again and ate well and seemed to be all right. About ten days ago, she bled at the nose and we thought she would bleed to death. She got over it and has not bled since. She ate well and seemed all right otherways. A fine two-year-old cow standing beside her bled at the same time, and several times since, but not as much. She seems all right otherways.

I have a fine lot of young heifers from six months to two years old that have a few sores or ring worms, as I call them, coming around the eyes and nose. I have used sulphur and lard and a small amount of carbolic acid, but they still come. G. F.
Michigan.

ANSWER.

Don't know the cause. There are many for such conditions. A personal examination is really necessary to arrive at a fair, rational diagnosis. I am in fear you have an exciting cause somewhere, else two animals would not be at all likely to be afflicted at the same time, with such an unusual affection.

TORPID LIVER.

I have a grade Jersey three years old in March, and freshened Dec. 1. Was very promising. She is now drying up and getting very poor. Eats all kinds of roughage quite well, but refuses all heavy grain. Is costive. Have given three or four doses of your cow physic; also some of Fowler's solution of arsenic, recommended by a veterinarian as a tonic. She has never had a cough and seemed to do well for a month after freshening. W. I. K.
Wrights Co., N. Y.

ANSWER.

Let arsenic alone. I expect a torpid liver is to blame. Give her four—only—drams of podophyllum—mandrake—in two ounces of old whiskey and four ounces of water, daily up to three—only—doses. Rest two days; then give four drams of golden seal for three days, one dose each day, in the same amount of whiskey and water. Rest four days, then repeat the mandrake for two doses, then the golden seal for two doses. In one week repeat each—only once. Then stop.

CLOSED TEAT.

My cow has had a front teat that has never given a drop of milk for the last two years. Last Sunday she dropped a calf and she had a fine udder, well shaped and all teats looked full even the dry one. Well, I tried the bad teat, squeezed very hard and I got milk and have been milking it ever since but there seems to be a lump inside with a sort of a cord running up into the udder, and when milking this lump will at times stop the flow of milk but after working teat and lump I again succeed in getting milk. Cow is about five years old. F. C.
Principio, Md.

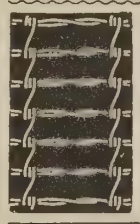
ANSWER.

You need the best, and easiest milk tube to be had, and above all, a good dilating plug. This will be more than likely to open the teat permanently.

SORE FEET.

I have 11 cows. Have good warm barn, good hay, ground feed and nice spring water. Plank floor laid on 2 x 4 imbedded in gravel. But two of my cows have raw sores around top of hoof, and some of the others are sore between the hoof. About six years ago had two cows troubled the same way in summer time. I have been using ⅓ carbolic acid and ⅔ oil of tar. C. H. B.
Tavera, Wis.

ANSWER.



Let so called carbolic acid alone. Wash thoroughly with tar soap and hottish water. Then keep wet with fish oil one quart, oil of tar one ounce, thoroughly mixed; between times apply a cloth saturated with compound tincture of myrrh and aloes. Remove from the hard floor for a while. You have some general exciting cause somewhere, find and remove it.

A Cure for Calf Scours.

ED. HOARD'S DAIRYMAN:—Would like to let you know what I have found to prevent calves from getting scours or diarrhœa.

Put about 1 pint of fresh water to about 4 quarts of milk, this is a cheap, simple remedy and have tried it almost a year, and since have not lost one; have made a practice of feeding all our calves with some water in the milk for about two weeks.

Last spring before I commenced using the above I had one calf that had the scours so bad she would not drink any more. My cheesemaker told me to try rennet; that is, take a calf's stomach and prepare it like you would if you would make cheese. I took a spoonful of rennet to about one quart of milk, and gave it to the calf, and by using that I saved the heifer calf. The rennet curdles the milk and keeps it in the stomach. It seems to be quite common among farmers to lose some calves having the scours; more so than it used to be. F. TSCHUDY.

Monroe, Green Co., Wis.

Special and Dual-Purpose Figures.

ED. HOARD'S DAIRYMAN—With the DAIRYMAN for a starter, here is a little example I have figured out, and what is true in New York state, I think will apply most any where.

The special-purpose dairyman gets per cow as follows:

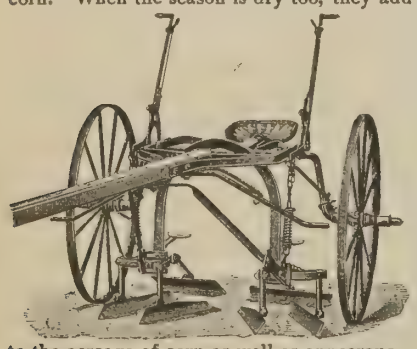
7,000 lbs. milk at 70c per hundred	$49
Calf and milk fed to hogs	12.50
Total	$61.50

The dual-purpose dairyman gets

3,000 lbs. at 70c	$21
Calf, if a good one	12.50
Total	$33.50
Bal. in favor of special-purpose dairyman	28.00

Three years ago I was a dual-purpose dairyman, and had to sell all the crops I could spare to make as much as I do now, from my cows alone.

You probably will ask how I made the change. I came to the conclusion that I couldn't stay in the milk business with the beef cow as a partner. By weeding out my poorest cows, I brought the average of my herd to 5,000 pounds. I traded my Durham calves for Holsteins, bought a full blooded bull, made my stable warmer, built a stave silo and a cement drop, and tried to do everything by new methods. Some of my Holsteins have calved since, and with the addition of ensilage to my ration, I have brought the average of my herd, including heifers to 7,000 pounds.



I always have something in the manger for my cows. A high strung animal as a good dairy cow, don't like to wait until after she is milked for her feed, any more than a hungry man likes to wait for his supper. You may say, "this is as a cow has been broken in." I don't think so. At least, it brings them to the stable at milking time, and when I open the door, I don't have to yell like an Apache to get them in. No whistling, singing, yelling or dogs are allowed in my stable.

I have set my standard at 10,000 pounds of 4% milk, and with HOARD'S DAIRYMAN as a partner, I expect to get there.

Chaut. Co., N. Y. W. H. PRITTIS.

ILLUSTRATION.

Tower's Surface Cultivators have been for many years noted for excellence in destroying weeds of all kinds infesting the growing corn. When the season is dry too, they add

to the acreage of corn as well as appearance. For a finish in cultivation all experts are agreed that such shallow tillage is desirable at all times. This, too, is in harmony with the experience of thousands of practical corn growers. An interesting treatise on corn culture will be mailed any one on writing J. D. Tower & Bros., Mendota, Ill. An illustration of the latest improved cultivator may be seen above.

CONSUMPTION

"THE GREAT WHITE PLAGUE."

Because of its striking resemblance in many respects to a heavy, destructive snow storm CONSUMPTION has been aptly called "The GREAT WHITE PLAGUE." It may be said also of CONSUMPTION that, as a rule, it comes on so gently and softly that its step—its earliest symptoms—is rarely heard Indeed, it's first presence or near approach is seldom suspected.

There is, perhaps, a slight cough, but little attention is paid to it. "Oh, it'll soon pass off," says the victim; "it doesn't amount to anything." But it perhaps does amount to a great deal. It may be the first danger signal that has been sounded. There has also been more or less "wasting away," a gradual loss of flesh and strength, that perhaps has attracted little or no attention.

As the disease progresses there may be slight raising of blood from the throat or chest, or a more or less persistent tickling in the throat, or there may be a shortness of breath, with or without pain in the chest; or there may be an increased tendency to "take cold," with a correspondingly diminished power to throw it off.

Or, again, the slow, quiet beginning may be indicated by a gradually increasing pallor or loss of color in the face, excepting, perhaps, a small bright red spot on each cheek, and in the female by diminution or cessation of menstrual discharge.

All of these conditions, especially when they show themselves prior to or during early adult life, are to be viewed with suspicion and regarded as sure indications that the unfortunate victim is nearing death's crater.

And it is at this stage that scientific medical treatment should begin. Cough, expectoration of a more or less thick, opaque substance of varying color, from whitish gray to green, sometimes of blood; increased shortness of breath, dull pains in the chest, advancing emaciation, with corresponding loss of weight and strength, profuse night sweats, feverishness and diarrhoea are prominent symptoms. Of course, not all of these symptoms are necessarily present in any one case, but some of them are, and any one should be a signal to be acted upon at once.

If CONSUMPTION be recognized in its early stages, the difficulty of curing it is greatly lessened, but that it can be cured, even when its victim is on the brink of death's crater, is an indisputable fact. It is a germ disease, and a system of treatment that will destroy these germs and restore such waste as has resulted from their presence will certainly and surely effect a permanent cure.

No ONE medicine combines in itself all the properties requisite for successfully curing consumption.

The Dr. Slocum Treatment embodies in its Four Preparations the most logical, advanced, scientific and successful cure.

When Dr. Slocum first published his theory, about twenty-five years ago, and asserted that CONSUMPTION was a contagious and curable disease, he was laughed at by his fellow-physicians. But he was not discouraged. He went on perfecting his System of Treatment, curing thousands of patients each year, and waiting patiently for the endorsement and approval of the medical world.

And he did not wait in vain. Strange to relate, the first open endorsement came from abroad—across the ocean. Dr. Sir William Broadbent, physician to Royal Family, at a recent meeting held in Marlborough House, presided over by the Prince of Wales, indorsed the principles upon which the Slocum System is founded. Now it is indorsed and approved by progressive, liberal-minded physicians everywhere.

The Dr. Slocum System of treatment embodies the healing powers of medicine, combined with the rebuilding and rejuvenating powers of food. It promptly allays the cough, relieves pain and other distressing symptoms, insures rest and sleep, and suspends or destroys the energies of the disease germs, while its food elements restore the waste tissues, increase the red corpuscles of the blood, steady the nerves and so invigorate and strengthen the whole body of the sufferer that it throws off and eliminates every element of the disease.

Elixirs, bitters, cordials and opium mixtures afford temporary relief in many cases, but they do not cure; they merely mask the symptoms and waste valuable time; they should be avoided studiously.

The Dr. Slocum System of Treatment not only removes the cause in CONSUMPTION, but it also prevents a recurrence of the disease by so enriching and purifying the blood that its powers of resistance become so great that the germs of the disease cannot again enter the lungs or find lodgment in the vital parts of the body. This proves its value as a preventive as well as a cure

Dr. Slocum has devoted more than twenty-five years to the study of Consumption in all its phases. He is familiar with its every stage and symptom. By means of the microscope he has studied its germs until he is perfectly familiar with their shape and form, their habits and the surest method of destroying them. You may therefore readily understand why the Dr. Slocum System of Treatment is an infallible cure for Consumption.

If you or anyone near and dear to you, or in whom you feel an interest, have any of the symptoms here described, do not delay, and thus waste valuable time, but begin the Dr. Slocum System of Treatment NOW. Every day of delay adds to the seriousness of your condition.

Consumption is an aggressive, merciless disease; it never relaxes its hold on its victim. On the contrary, both day and night it fights for the supremacy, and will always win if not checked by proper treatment.

The Dr. Slocum System of Treatment is not an experiment; it has cured thousands of cases, and it will cure you.

The FREE treatment is within the reach of all sufferers.

ACME PULVERIZING HARROW, CLOD CRUSHER AND LEVELER

For all soils, all work—crushes, cuts, lifts, pulverizes, turns and levels. *Cast steel* and wrought iron—therefore *indestructible.* Cheapest *riding* harrow and best pulverizer on earth. Sizes 3 to 13½ feet. Catalogue free.

SENT ON TRIAL to be returned at my expense if not Entirely Satisfactory.

I deliver free on board at New York, Chicago, Columbus, O., Louisville, Ky., Minneapolis, San Francisco and other points

Address DUANE H. NASH, Sole Mfr., MILLINGTON, N. J., or CHICAGO, ILL.

PLEASE MENTION THIS PAPER.

THE FAMOUS KEYSTONE LINE OF SEEDING, PLANTING AND CULTIVATING TOOLS.

Victor Disc Harrow —greatly improved for '99. Oil tubes to the bearings from top of frame—positively exclude all dust or dirt. Steel scrapers, double adjustment levers—easy to place gangs at any angle. Ball bearing—no side pressure and easy draft. Made 4, 5, 6, 7 and 8 ft. wide, with 18 or 20 in. discs. SEEDER ATTACHMENTS are made for 6, 7 and 8 ft. disc harrows.

Keystone Force Feed Broadcast Seeder are made 8½ or 11 ft. wide. Sows broadcast all small grains in any quantity in the best possible manner. Mounted on low steel wheels. Made with or without grass seed attachment. Equipped with CULTIVATOR ATTACHMENT if ordered. Made with end wheels or middle wheels. Has the best force feed we know. Send for special Seed Circulars.

Keystone Rotary Drop Corn Planter —it's a whole hill drop, each hole in seed plate holds enough grain for a hill. It never skips or misses. Equipped with Automatic Wire Reel. Has a drill attachment. Gear throws out automatically at end of row. Always drops at even depth because of the shoe gage on each runner.

Keystone Potato Planter —sprung quickly into popular favor because it is a simple and effective machine for the purpose at a reasonable price. Fits the needs of the man who grows an acre or two of potatoes, but who is not regularly in the business. Plants 10, 14, 17 or 20 inches apart in rows. Send for circulars.

Keystone Walking Cultivator. This is clearly a leader among the machines of its class. It is made entirely of steel and iron except tongue, singletrees and neck yoke. Strong and well braced in every way. Steel braces and four soft center steel shovels. Full line of Riding Cultivators also. Send for circulars.

KEYSTONE MANUFACTURING CO., 39 RIVER STREET, STERLING, ILLINOIS.

DON'T BURN FEED

Grind grain in the mill that does not heat up and damage it.

QUAKER CITY Grinding Mill

Perfect action, avoiding friction, and giving the best meal. Grinds corn and cob, and meal for feed and table. Catalogue free.

HISTORY.

But One Case of Scores of a Similar Character—A Recital of Practical Experience as against the Wild, Irresponsible Promises from a "Trick" Babcock Test Man.

ADAMS CENTER, N. Y., Dec. 27, 1898.

Dear Sir:—

As regards the trial test between the Sharples Tubular and the Alpha separator which we have been running at our factory.

Five thousand pounds of milk was all put into one vat. It was stirred continuously while two weigh cans were filled with milk until they both weighed alike, which was repeated until all the milk was weighed and run into two separate vats in the presence of the agent for the Alpha separator, the Sharples Separator having no representative there.

Each vat contained the same number of pounds. One vat was first separated with the Alpha, then the other with the Sharples Tubular machine. The cream was carefully cared for and churned the following day, each lot separately.

The Sharples "Tubular" cream churned out a little over seven pounds more butter than the Alpha.

Our buttermaker will make affidavit to the above results if it will be of any value to you. I think we must be convinced which is the best machine by this time.

Yours very truly,
HARRISON FULLER.

A Sharples Tubular will not only produce more butter from the same milk, but it will make a better quality of cream and butter than can be secured by any other means.

The "SQUEEZER"

COMBINED CHURN and BUTTER WORKER

Makes possible exhaustive churning at low temperature. It does not grind the butter, but squeezes it, thus avoiding "salvy" butter and always making that of perfect grain. It mixes the salt perfectly and leaves the butter of even color and even texture. It is easy to keep clean, as all parts may be reached easily with a scrub brush. It is

STRONG and DURABLY BUILT

will not break, and requires few or no repairs. Five sizes for creameries, 300 to 700 gals. Three sizes for dairies—50 to 150 gallons.

SEND FOR CATALOGUE NO. 40 giving Prices and Testimonials.

SUCCESS

This is the magic word that marks the limit of every man's aspiration. Men who have and men who will achieve success are those who take advantage of every faculty which the world affords in their particular line.

...The DISBROW

COMBINED CHURN and BUTTER WORKER.

IS ITSELF A SUCCESS,

And will promote the success of every man or institution which uses it.

It will make *more* and *better* butter than any separate machines. Nearly all the premium butter exhibited at fairs and conventions during last year was made in these machines.

KNOWLEDGE

Of the aggregate results from your herd ought not to satisfy you. Your aim should be to bring the average up to the best results from your best cow. This is up-to-date dairying. What you want is quality, not quantity. In order to intelligently weed out your herd you should have one of our

IDEAL HAND TESTERS.

You may be surprised to find that some of your cows which have been "filling the pail" have been filling it with water. Knowledge gives confidence. These are things that IT WILL PAY YOU TO KNOW. Our prices on these Testers are reasonable. Write for them.

A Grand Prize Winner.

ED. HOARD'S DAIRYMAN:—I send you a cut of my young bull, Vermont Pogis, 2nd, A. J. C. C. 45316, dropped February 19th, 1896. His sire, Vermont Pogis, was by Stoke Pogis 3rd and Joy of Prospecta, a daughter of Old Pedro. His dam was Pride's Ruth, she by Rioter's Pride, and he by Stoke Pogis 3rd.

This young bull has run the power all summer to separate and churn. He also headed my herd at the Franklin County Fair, that took the grand herd prize.

Enosburg Falls, Vt. E. M. KIMBALL.

Butter Fat and Feed.—Annatto.—Co-operative Creameries.

ED. HOARD'S DAIRYMAN:—As among your late subscribers, I presume we shall ask questions that you have often answered before, but we are anxious to establish the latest and best methods of dairying and butter making here, and many of our people must begin at the beginning.

1. As to butter fat from feeding, etc., Dairy Commissioner, W. W Baker, of this state says in *Oregonian* of January 16th, page 35, 'It is now a settled point that feed, while it improves the animal and increases the volume of milk, does not increase the percentage of butter fat in the milk" Is that an exact statement of the case? It does not seem to accord with experience here. The manager of a creamery at Rainier, Oregon, tells me that in the spring when white clover is very rank, the test of buttter fat sometimes shows but 2½%, while the average for the year is 3.8%, and a farmer near Albany, Oregon, obtains a per cent of five when feeding wheat hay. Some of us think we do not understand the relation of butter fat to feed, especially as you insist so much on good feed and balanced rations. Will you explain the doctrine for beginners?

2. What is annatto, and what are its physiological effects—nutrition, inert, irritating or injurious to the human system?

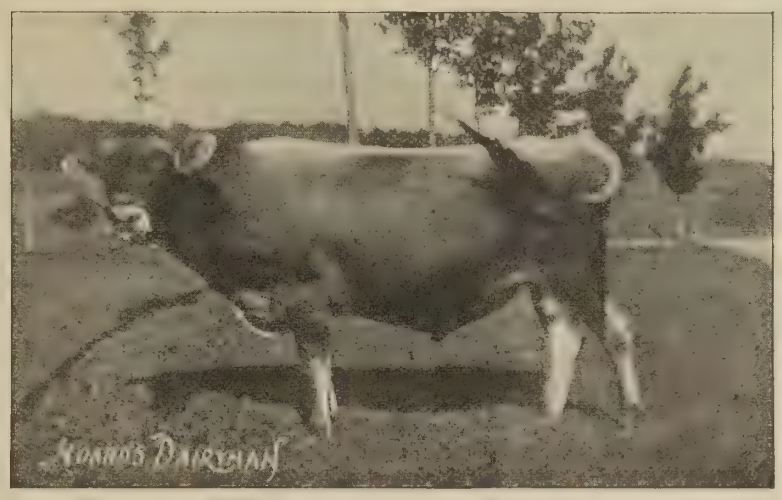
3 Can you tell me what proportion of creameries in Wisconsin and Minnesota are on the co-operative plan? Of the United States? Of Denmark or any European country? H. S Lyman, Sec.

Clatsop, Co., Oregon.

The statement made by Mr Baker is on the assumption that when a cow is well and properly fed and taken care of, she will give milk of a certain richness. Beyond that, we cannot, by changing the composition or amount of feed, increase the per cent of fat in the milk, although the total amount of fat produced can be largely increased. The statement of your butter maker does not at all disprove this, although he is probably correct in his claim. Young, rank clover sometimes contains not over 10% of dry matter. A cow on such feed would require 160 pounds of green clover to sustain the daily bodily waste, and 240 pounds to make up an average ration of 24 pounds of dry matter per day, not taking into consideration the probable lower feeding value of the solids in such young clover. It is easily seen that on such feed a cow cannot eat enough to support herself, and give rich milk at the same time; consequently, the milk suffers. Most of the uncertainty regarding the effect of food on the composition of milk, comes from the fact that so many herds are improperly or under fed. A return to full feeding will frequently show a marked increase, both in per cent and total amount of fat produced, but when once the cow is brought up to her normal yield, we cannot, by any change in the feed, go beyond this point. Every cow has a point beyond which she will not go. She may fall short of it by improper feeding, but cannot be forced beyond it by any combination of feeds known to the dairyman.

Annatto is a coloring matter obtained from the seeds of the Bixa orellana, a plant found in Brazil. It seems to be an entirely neutral coloring material, without any effect on the human system.

We cannot find any figures on the number of co-operative creameries in Wisconsin. In Minnesota about 65% are co-operative. The other figures we cannot give.



Calf Scours.

ED. HOARD'S DAIRYMAN:—I see a great deal written of how to cure sconrs in calves. I have raised from eight to ten calves every year for the last eighteen years and have never lost one from scours. Now I think an ounce of prevention is worth a pound of cure, so the time to begin to raise the calf is before it is dropped. While the mother is farrow I feed very little grain, but plenty of hay and fodder with free access to salt.

Two weeks before calving I increase the grain so that at parturition she is receiving one third of a ration, feeding bran or other laxative food, and by the judicious use of salts keep her bowels loose and temperature normal. A few days before delivery (and if you are a good student of cowology you can tell) I give her one half to three fourths of a pound of salts. After the calf is dropped I let it have free access to its mother for two days, after which, until it is five days old, it sucks twice a day. For the next few days I feed it twice a day one-half gallon of fresh milk at a feed and then put it gradually on sweet skim milk, warmed, until at two weeks old it is getting three quarts and at four, one gallon with a spoonful of middlings or bran; after which I increase the bran to one pint and induce it to eat a little whole oats or corn and plenty of hay or grass.

I do not increase the milk any until it is several months old, when, if we have plenty of milk, it will stand six quarts at a feed and less grain. If we are short of milk, give more bran—in fact, have raised some fine calves on one gallon of milk per day and lots of bran, and if at any time some one (I can't do it all myself) who is delegated to feed it, feeds too much, or too warm, or too cold, or at irregular times, and the calf gets off its feed, or gets the scours, I soon correct it by giving a gentle physic and then a raw egg at each meal, for a few days; and providing the case is stubborn and won't yield, I use a tea made by steeping blackberry roots in water As my calves are all Jerseys, and raised for cows, knock all bull calves on head immediately at birth, and boil for the chickens. Twenty-five cent butter and Jersey veal don't go together. I endeavor to induce the calf to eat all the bulky feed possible, so in after life it will have that fine taper, from the middle each way; and I might say incidentally, that I have never had a case of milk fever, hollow horn, or wolf in the tail. Mr. Editor, we have a few men and old women who still believe in the latter two ailments.

Wisconsin Cheesemakers' Association.

Report of Committee on Resolutions.

Resolved, That we tender our thanks to the mayor and citizens of Madison for their cordial welcome and interest in our deliberations.

Resolved, That we appreciate that the growth of this Association and the success of our meetings are largely due to the persistent and tireless efforts of our capable secretary, and we are glad to record this fact and to express to him our sincere thanks for his unselfish work, which has been given without recompense.

Resolved, That we hereby extend to the Wisconsin Dairymen's Association, which holds its annual meeting at Green Bay, February 16th, fraternal greeting. This Association is organized as a helper and not as a competitor of that Association. The Dairymen's Association has scattered a great wealth of dairy knowledge all over Wisconsin. As a child of that Association we honor our mother and will do the best we can to be an honor to her.

Resolved, That the Davidson Bill now pending in Congress, which places a government tax of ten cents per pound upon oleomargarine or imitation butter, has the hearty approval of this Association. We commend the action of Mr. Davidson in introducing the measure designed for the protection of consumers and producers of dairy products, and promise him our active support in securing the passage.

Resolved, That the thanks of this Association is hereby extended to our Dairy and Food Commissioner and his assistants for the prompt and efficient manner in enforcing the laws designed to suppress the sale of imitation dairy products in this state.

Resolved, That this Association heartily commends the efforts of the Hon. James Wilson, Secretary of Agriculture, to increase the foreign markets for American dairy products, and hopes that Wisconsin cheese will have a place in some of the trial shipments of cheese to England And that the department will send an agent to England who will see the retailers and consumers are made aware that the cheese are made in the United States.

Resolved, That this Association endorses the recommendation of the Secretary of Agriculture in his message to the President that steps be taken to protect the honest producers and shippers of dairy products from competition of fraudulent or imitation dairy products.

Resolved, That our thanks are hereby given to the Secretary of Agriculture for sending to this meeting representatives of the Dairy Division, R. A. Pearson, assistant chief, and Mr. J. H. Monrad, special agent, whose assistance in the meetings is fully appreciated. We believe that a permanent field agent of the Dairy Division in Wisconsin and neighboring states would be a material assistance to the dairy interests of this section.

WHEREAS, The Wisconsin Dairy School has never been able to accommodate all who have applied to take the courses there, and that this year the school is in a very crowded condition, and when we remember that the Swiss, Brick and Limburger industry needs recognition by proper courses of instruction, and that this instruction is not possible till the facilities for instruction are enlarged, be it

Resolved, That we petition our legislature to make such appropriation as the Regents of the University may deem necessary to procure the needed enlargement to the dairy school building, and provide for the increased expenses of the school under the increased instruction.

WHEREAS, The Wisconsin Cheesemakers' Association, now for six years, has shown the value of its work, we confidently hope a bill will be passed appropriating at least $600 to enable us to secure prominent speakers and to publish a stenographic resort of our proceedings, as well as to encourage a large exhibit.

WHEREAS, We highly appreciate the educational value of the assistance given by Mr. J. H. Monrad at all meetings during the past six years, we desire to express our appreciation of his aid, and

WHEREAS, The Hon D M. MacPherson, Lancaster, Ontario, has so kindly assisted us in making this the most successful meeting in the history of this Association, therefore, be it

Resolved, That we extend our most heartfelt thanks to him for the assistance he has so kindly rendered us and be it further

Resolved, That the thanks of this Association be extended to F. A. Tripp and C. A. White for their valuable and timely financial aid in times of need.

Feeding Cotton Seed Hulls—Dairy Babies—Butter milk from Skim milk.

ED. HOARD'S DAIRYMAN:—I am striving to manage my farm so as to make all the coarse feed for my cows, not sharing the general belief here that cotton seed hulls are good cow food.

In beginning anything, I always try to do what some other man did that succeeded, and the man that I imitated in the dairy business is a skilled veterinarian and dairyman, and he condemned cotton seed hulls, and told me to raise cow peas and other forage crops, and let the other fellows have the hulls.

It is needless to say we are both subscribers to HOARD'S DAIRYMAN, and agree with its teachings. We both have babies at our homes, yet I am only a single boy, but the "Babies" (No. 2) are the pride of our dairies and could not get along without them. My neighbors (except the man of whom I am an imitator) say it is a waste of money to pay a big price for said "Baby" when I could go on in the old ruts and lose 20% of my butter, and get 10 cents per pound less for my butter.

I see in this week's paper that our brother in South Carolina is not yet satisfied with his butter milk, as we are the parties at Atlanta of whom he heard, that made good butter milk, from separator skim milk, I will tell him how we do: First we separate at 85°, and as soon as separating is over, we add a starter which is the butter milk from the cream. The milk should not get cold, between 75° and 80° being best; it will clabber in about 12 hours, and will break up fine, and is as good as any butter milk; we furnish the Grady Hospital in Atlanta that is proof that it is all right.

East Atlanta, Ga. R. T. A.

TO THE MEN WHO DON'T TAKE HOARD'S DAIRYMAN.

Mr. J. Moldenhawer, of Washington, D. C., is a highly skilled dairyman. He is engaged in producing the finest of milk for the highest paying demand. Mr. J. C. Jurgensen, of Brooklyn, N. Y., in writing to us in the issue of Sept. 23, concerning a visit he paid Mr. Moldenhawer, says:

"Mr. Moldenhawer is himself picking out Hoard's Dairyman before any other of the many farm papers he keeps, and he frankly says that your great paper is of high value to him. When a man with his reputation says so, how can the farmers who expect to make money by keeping cows for dairying, get along without the Dairyman. Still it is a very trying job to try to convince farmers how much it would help them to keep an extra good dairy paper."

What is the lesson that the above teaches? This: That no man who is keeping cows for profit can afford NOT to have such a friend and adviser as Hoard's Dairyman at his elbow every day in the year. Simply put a dollar bill in a letter with your name, post office, county and state plainly written on a piece of paper, and mail it to us, and secure the paper to Jan. 1, 1900.

Mr. U. S. Baer, who has for several years past been assistant instructor at the University Dairy School, and traveling cheese instructor for the State Dairymen's Association, has been appointed cheese instructor at the Washington Agricultural College, Pullman, Washington, for the spring term beginning March 13th. As instructor at the dairy school, traveling instructor for the State Dairymen's Association, and secretary of the Wisconsin Cheese Makers' Association, Mr. Baer has always proved a man equal to his task, and he goes to Washington with the kindest wishes of thousands of Wisconsin friends, all of whom join in the hope that he will soon return to Wisconsin to continue his much needed labors in the great cheese-making state.

STARVATION RETURNS.

How things do look sometimes when the light is turned on. A community of farmers start a creamery. One man is about as well posted as another, and none of them have ever made a conscientious effort to know what should be known about dairying. They desire to do well, to make a profit, but do not know what must be done to secure that profit. The season goes by and they find they have made no money and naturally enough they are dissatisfied.

How fortunate if some kind friend comes along, like D. H. Otis in the case of the Meriden creamery in Kansas, and says: "Let us investigate. Let us look into the foundations of this question from the farm end of it, like business men."

Then, when they see the truth—how they have been keeping a lot of cows utterly unfit to do business with, and very likely handling the cows without adequate knowledge of dairy conditions any of the time—they can see just where the fault lies.

Mr. C. C. Macdonald, Dairy Commissioner of the Province of Manitoba, Canada, has been making an investigation of somewhat the same character. He finds plenty of herds of cows where only 90 pounds of butter was the product per cow for the year.

It is time that every creamery and cheese factory in the land instituted an investigation among the patrons to see what are the actual returns per cow. The patrons themselves should call for and aid such an inquiry, and that they should call for its publication to themselves.

Let A see how much B made per cow the past year and it will stir him up to inquire why and how this was done. Every patron should welcome such inquiry as much as he would a lighted lantern in a dark night.

LAND PLASTER IN STABLES.

The *Montreal Journal of Agriculture* of January 15th, contains a statement to the effect that two such dry substances as land plaster and dung in stables, were not likely to exercise much mutual action in arresting the escape of ammonia. The editor further misleads himself, by taking the opinion of a chemist.

In the first place we ask, who ever saw a stable full of cows that was dry? The gutters to the rear of the animals, at all times, are anything but dry. Second, the ammonia that it is desired to save is thrown off almost entirely by the urine. That certainly is not dry. The land plaster is dissolved by the abundant moisture of the stable, and takes up the volatile ammoniacal exhalation, and holds it in chemical union until taken up by the plants. Dry earth or muck is not a substitute for land plaster, because its absorbing power is entirely mechanical.

Why theorize? Why not make a practical experiment by sprinkling a stable with muck one night and land plaster the other? Do this at six o'clock at night and note in the morning if the land plaster does not show a purer atmosphere when the stable is opened. Such, at least, has been our experience.

OHIO STATE DAIRYMEN'S ASSOCIATION.

The Fifth Annual Convention of the Ohio State Dairymen's Association was held in Townshend Hall, Ohio State University, on Tuesday and Wednesday, February 14th and 15th. While the meeting was not credited with as large an attendance as the program merited, it was nevertheless a most successful one. The members who were present were of the most enthusiastic men in the state. They were there to get some good from the meeting and if what they knew would be of benefit to any one, he was sure to get it freely.

During the entire session the Dairy School was open to the inspection of all the visitors. It was a constant source of attraction. Three or four men could be seen standing around some one of the instructors or other person connected with the school and asking for what they came for—information. Everything was gone over and examined with the greatest care and interest, from the creamery and cheesemaking room down to the bottling and pasteurizing room and the boiler and engine room. A great many complimentary remarks concerning the interest the students seemed to take and the neatness and dispatch with which they completed their work, were heard. Everybody seemed glad that he had come to the convention and thought he would try to induce some of his neighbors to come with him next year, as it was decided to hold the meeting at the University again next year. It was felt that too few people know what they have in the University and this might be the means of bringing someone into closer touch with it.

The opening session began shortly after nine o'clock, with an address of welcome by President Canfield, of the University. The president turned things over to the use of the convention during their stay and in a few well chosen words made everyone feel at home.

President J. Fremont Hickman, of the Ohio Agricultural Experiment Station, Wooster, Ohio, responded to the address and then gave his annual address.

Professor Hickman, in the first part of his paper, pointed out some of the ways in which dairymen made their business unprofitable. The average dairyman cannot feed a cow much under thirty dollars and have her do her best. There is room to suspect therefore that some of us are feeding cows without profit. The cow that is compelled to stand in the barnyard with her back bowed up to keep warm, is not the one that pays dividends. The speaker ventured the assertion that two-thirds of the cows in the state did not pay profits and that only one-third could be classed as genuine profit makers. No man or any law compels any one to keep poor cows. It was the opinion of Professor Hickman that the cow power of the state could be increased fifty per cent without increasing the number of cows or adding anything to the expense side of feeding and caring for them.

Mr. Crowner, of Mentor, Ohio, read an excellent paper on "Method of Preparation, Use and Results of Starter." He showed how they could be prepared from cream, milk and buttermilk. He also took up the use of commercial cultures and gave the rules governing their use. Their action depends upon the same agents that the ordinary starters depend upon, that is, bacteria. Mr. Crowner urged the absolute necessity of perfect cleanliness about the creamery and cheese factory.

Major H. E. Alvord was to have presented a paper next on the program, but owing to excessive work was compelled to be absent. At this time the paper by Dr. White, of the College of Veterinary Medicine of the University, which was on the program for the next morning, was given. The subject of this paper was the "Prevention and Treatment of Injury and Diseases of the Udder." The diseases most common to the udder were classed under four heads which were as follows:

Oedema of the udder.

Catarrh of the milk cistern and ducts.

True garget.

Inflammation of the interstitial tissue of the gland.

Dr. White urged the necessity of great care in the prevention of infection. Garget was most often caused by infection. It was shown how great the liability to infection was when a strange cow was brought into the herd. She should be treated with suspicion until it was shown that she was perfectly sound.

The program was continued by a talk by Mr. B. B. Herrick, Wellington, Ohio, on "The Best Kind of Cheese for the Ohio Cheesemaker." Mr. Herrick seemed to have but one wish and desire and that was for the betterment of the cheesemakers of Ohio. He thought that we should have nothing but whole milk cheese. There might be different kinds of full cream cheese. For Ohio he thought he was warranted in saying that if the cheesemakers would stick to the cheddar process it would ultimately be for their advantage.

In a talk similar to Mr. Herrick's on "The Rennet and Curd Test Practically Demonstrated," Professor Noyes, of the Ohio Dairy School, entertained the association for a short time. The rennet test was used to determine the acidity of the cream and by means of it much time and labor was saved. We could know just how ripe our milk was and how long to cook it. By the use of this test you would be able to keep the quality of your cheese pretty even for the season. The curd test is effective in determining taint in the milk. A sample from each patron's milk is saved out and placed in a bottle for the purpose. The rennet is added and when in condition the curd is sampled and if any are found in which there is anything wrong, that patron's milk can be tested for the individual cow and when she is found the trouble can be easily gotten rid of.

The evening session opened with an address by Dr. Bleile, of the Department of Physiology of the University. His talk was on "Bacteria in the Creamery, Dairy and Cheese Factory." He gave an outline of how the students were taught bacteriology. They first found out that bacteria were vegetable organisms instead of "bugs" as many people suppose. A very few species came into prominence in the dairy. We could see their effects in gases in cheese, ropy or slimy milk, bitter milk, etc. The injurious forms are found wherever there is filth. Cleanliness and sunlight will drive them out.

Professor H. A. Weber, of the Department of Agricultural Chemistry of the University, followed Dr. Bleile with a paper on "Food Adulteration." He spoke first of the many ways in which foods were adulterated and then took up the subject of the different products adulterated. Milk was the most common victim for this work. It was pointed out how great the danger was from this source. When poor water was used in this adulteration there was always the menace of disease. Further than this the food supply of children who have to depend on milk for their sustenance was almost cut off in this way. It was the opinion of the professor that a thing which so nearly concerned us all every day as our food ought to be better looked after.

The second day's session was opened by a practical demonstration on judging dairy cattle. The meeting was called to order in the large live stock room in the basement of Townshend hall, after which four grade Holstein cows were brought in and Professor Hunt, of the College of Agriculture of the the University, took up the subject "Scoring Dairy Cattle Practically Demonstrated in Live Stock Lecture Room." He took the score card which is used to teach the students how to judge the cattle and went over it from beginning to end pointing out the most important points to be considered in the dairy cow.

Mr. E. F. Smith of the firm of W. B. Smith & Son, Columbus, Ohio, read a very interesting and practical paper on "Feeding Cows for the Dairy test, State and National." He said that the modern dairy cow was a product of education. To get her ready for the tests she was taken about two months before calving and gotten into the pink of condition by extra care and attention. Great care must be exercised in the feeding. A good feeder is a rare man; he must be a man who knows just when the cow has had enough. The official test is conducted by the Experiment Station which will send you a man for seven days to conduct the test, with no charge except for board and expenses. These tests can be relied upon for they are made by intelligent, honest and interested men.

The discussion of Mr. Smith's paper was opened by a paper by Mr. C. W. Horr of Wellington, Ohio. Mr. Horr showed how easy it was under the present way to discriminate in favor of one breed or another. For example, if the butter is valued at a low price, and hay, grain, etc, consumed, at a high price, then the small breeds would have an advantage, but if the by-products are valued fairly, the butter produced credited at top prices, and the feed charged on the basis of country prices, then the Holsteins certainly have the pole.

The afternoon session was opened by a paper by Mr. George E. Scott, Mount Pleasant, Ohio. His subject was "Dairy Stables." He said that while there were many important things connected with the handling of dairy cows, none were of more importance than good first-class stabling. This stabling should secure five things:

1st. Protection against cold.

2nd. Provide ventilation.

3rd. Construction of stalls that will secure cleanliness and give the animal her rightful share of comfort every hour that she may be confined to her habitation.

4th. A bountiful supply of light is more than essential.

5th. Good sanitation.

Mr. Bentley of Circleville, Ohio, gave a very entertaining paper on "Which is better for Ohio, the Whole Milk or Gathered Cream

The Winooska, Vermont, Journal says:

"The best dairy farm in Vermont is owned and run by Mrs. Carrie Nelson, a widow, who has managed her farm and educated her four children since she was left alone thirteen years ago." She has won first prizes on her butter at the Vermont Dairymen's. Meeting, at the Vermont State Fair, at the World's Food Fair, in Boston, and at the New Hampshire State Fair.

Mrs. Nelson has a dairy of 26 cows and makes them yield over 300 lbs. per cow. She writes: "I cannot afford to get along without HOARD'S DAIRYMAN while I continue to farm."

If others thought as Mrs Nelson does, they might have some of the same success. Dairy success is based on knowledge. It is the cheapest thing out (less than 2c a week) and only a few of the great mass of farmers who keep cows appreciate it.

One of the most successful dairymen in Wisconsin, Mr. Chas. Meyers, of Kewaunee County, in his address at a late Convention on "How to Become a Dairyman," said:

'My advice to the average farmer is to begin by subscribing for HOARD'S DAIRYMAN. Experience is a good teacher, but it is a much cheaper and quicker way to learn from the experience of others."

He has 120 acres, on which he carries a dairy of 20 to 27 cows, from which, in 1896, he sold $2,000 worth of butter, hay, etc,, leaving him, after paying for his grain, feed, etc., $1,600.

Is it not worth a dollar a year to help produce such results?

System." The subject was very ably discussed by Mr. Bentley and while he showed himself to be heartily in favor of the separator, he thought that under present conditions too much expense was involved in making the change and also that the people must come gradually to it, which they were fast doing. His ideal of a system was the farm separator system.

The last paper of the convention was one by Mr. Leon D. Smith, Mantua, Ohio.

The subject was "What can this Association do to Advance the Dairy Interests of Ohio?"

He advocated the general introduction of the Babcock test in the purchase of milk and the doing away with the pooling system. As an addition and extension of this he thought the Association ought to ask the legislature for an appropriation to hire instructors and send them throughout the state to give the cheese makers and creamery men instruction free of charge. This would tend to bring the products nearer to one quality and raise the average, wonderfully. This idea was taken from what is now being successfully carried out in Wisconsin and Quebec.

This closed what was probably the most successful meeting in the history of the Association. The officers selected for the next year were:

President, Mr. D. A. Crowner, Mentor, Ohio; Vice-President, F. M. Wilson, Selma, Ohio, Sec. and Treas, Mr. L. P. Bailey, Tacoma, Ohio.

The board of directors consisted of: Professor Hunt, Columbus, Ohio; Mr. C. W. Horr, Wellington, Ohio; Judge Bradbury, Columbus; J. A. Pringle, Columbus; and Professor J. Fremont Hickman, of the Experiment Station, Wooster, Ohio.

An Experience with Abortion.

ED. HOARD'S DAIRYMAN:—On looking over the DAIRYMAN of to-day, I find that some one has been having trouble with cows aborting.

Fourteen years ago I had twenty-five cows and heifers, mostly full blood Jerseys and Holsteins, both registered. Few were grades. In just eighteen months I had twenty-eight abortions. From sixteen cows two aborted three times, eight twice and six once. It is hardly necessary to tell that I was discouraged. Everybody had a cause, everybody had a remedy. I read everything I could find on the subject but this is what I did for more than twelve months before it stopped; sprinkled slacked lime all through the stables and barnyard and walks. Used carbolic acid freely, washing all the parts that were filthy, also sprinkled the stalls and gutters (used tablespoonful to pail hot water).

I kept the affected cows in different fields, but the last two that aborted were two very promising heifers. They had the most filthy and offensive smell of any before. I had them tied to keep them separate from the balance of the herd but the second day they jumped in with the herd, fourteen of which were in calf. I got mad and said to myself 'I'll let them go, I have done everything that could be done, my herd is ruined.' It is singular to say that I never had another abortion from that day to this and the herd since has been increased to as high as ninety head. J. F. W.

West Virginia.

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name, Post-office and state of writer. Condense the questions into plain specific inquiry. Be careful to note if your questions have not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

FEEDING STANDARDS FOR MILCH COWS.

Dry matter.	DIGESTIBLE NUTRIENTS Protein	Carbohydrates.	Ether extract.
lbs.	lbs.	lbs.	lbs.
23 to 28	2.0 to 2.5	12. to 15.0	0.5 to 0.8

A WISCONSIN FEEDING PROBLEM.

We have ten cows, Short-horns. We feed corn stalks and hay that you might call prairie hay. We feed a pan full, six quarts, wheat bran and shorts, equal parts. Will you please give me a balanced ration to go with the above fodder? G. F. E.

Rogersville, Wis.

One could scarcely expect a dairy cow to eat more than about ten pounds of this corn stover, (corn stalks) and say twelve pounds prairie hay. This would furnish, not to exceed, 6-10ths of a pound of digestible protein, and would require fully twelve pounds of the bran and shorts to supply the deficiency. Or better yet, get some gluten feed and substitute about five pounds of it for say six pounds of the bran and shorts. Advertisements of gluten feed will be found in this paper, and on application, prices will be quoted for delivery at your nearest railway station.

COTTON SEED MEAL ADVISED.

Please form me a ration for 1,000 to 1,200 lbs. cows, out of early cut timothy and clover hay, mixed, $5 per ton, cotton seed meal $22, corn and oats $20, bran $15. Have bought a car of mixed feed, bran and middlings $16 per ton. Sell my milk to N. Y. Condensed Milk Co. They require 4% milk the year around. I get $1.26½ per 100 lbs. for six months winter milk, and 92 cents for six months summer. I cannot feed ensilage, wet or dry barley sprouts, brewery or distilled grains, linseed meal, oil cake, or gluten meal.

Cows freshened in August and September, bred in December. I feed hay three times a day; water at spring twice a day, ten rods from warm barn. I am feeding 8 lbs mixed feed, 2 lbs. oats, 2 lbs. corn ground with cob. Average milk per cow, per day 21 lbs. I think I should get more milk from the amount fed.

Those cows averaged 28 lbs. of milk per day, during October, on pasture and four pounds of the mixed feed. Cows take on flesh. Cows are Holsteins and Short-horns.

Chenango Co., N. Y. L. G.

Get some cotton seed meal to mix with the "mixed feed" in place of the corn and oats, and feed 2 lbs. per day—commencing with half that quantity and increasing gradually up to the full amount. One pound of cotton seed meal contains more protein than 4 lbs. of oats and corn.

DEHORNING COWS.

I have not seen anything in reference to dehorning cows in your columns since taking your paper. Have seen what has been said in regard to bulls. I am like some of your subscribers, not a born farmer, but from the city, consequently have to get lots of information through reading your columns.

Gwynnbrook, Md. C. M. S

We doubt whether HOARD'S DAIRYMAN could give an entirely unprejudiced opinion in this matter, because its editors have never resorted to this practice. It believes that time will justify its contention that the dehorning of bulls will prove detrimental; and for reasons similar to those advanced in regard to them, it would not favor dehorning the females in a specific breeding herd. The dairy herd proper presents a proposition of a somewhat different character, and it is undoubtedly true that the weight of evidence at this time is in favor of removing the horns.

RATION FOR AN INDIANA MILK PRODUCER.

Please give me balanced ration of following feeds: corn at 30 cents per bushel, oats at 27 cents, bran at $13 per ton and oil meal at $1.40 per hundred. Will it pay to feed it at that price? For roughage, clover hay and timothy mixed, shredded corn fodder and plenty oat straw. Raise my own grain; add 7 cents for grinding sack of oats and corn, with or without cob. Will it pay to have corn with cob ground, costing just as much as a sack of shelled corn.

Have grade Holsteins, weighing from 1,000 to 1,400 pounds. Ship milk to Chicago. J. S.

Merrillville, Ind.

One thing is certain. No man can afford to feed oats worth 27 cents per bushel, when he can buy bran at $13 and gluten feed at $16 or thereabouts.

We suggest a trial of the following.

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients Protein.	Carbohydrates	Ether Extract
15 lbs. hay	12.87	.72	5.94	.24
10 lbs stover	5.95	.17	3.24	.07
3 lbs corn and cob meal	2.67	19	1.89	.11
3 lbs. bran	2.64	.38	1.16	.03
4 lbs. gluten feed	3.69	.82	1.94	.14
Totals	27.82	2 28	14.07	.65

This is a large ration, for large cows, but doubtless, most of them will eat some of the oat straw in addition. If not, cut down on the other roughage until they will.

KEROSENE AS A BOILER COMPOUND.—PRICES OF ELGIN BUTTER.

Will the use of kerosene in the place of a boiler compound in a boiler in a creamery taint the butter when the steam is used only to heat the water which is used to cleanse the utensils and to steam the churn and worker? Would you recommend the use of kerosene for this purpose, and if so how much at a time?

Could you please publish the weekly prices of butter of the Elgin Board for the year 1898? P. B.

Gratiot, O.

Should decidedly object to the use of kerosene in a creamery boiler. Even with the greatest care, the kerosene will be liable to get into the vessels and thus taint the butter.

If you must use a boiler compound "soda ash" is as good as any, and will not taint anything.

Send 25 cents to D.W. Willson, Elgin, Ill., for a little booklet giving the prices of butter on the Elgin Board of Trade for 1898 and previous years.

PASTEURIZING MILK—TUBERCULOSIS.

1. In one of your back numbers you made mention of a Russell vat for pasteurizing small quantities of milk. Have made inquiry from five different firms and none of them know anything about it. So I came to the conclusion to have one made if you would be kind enough to give a little advice in regards to its construction and operation, or give me the names of firms handling the vat.

2. Got it in my head that tuberculosis in the animal kindom was the same as consumption in the human race. Is this so?

Utah. C. J.

On a small scale you can pasteurize milk by setting a pail of milk in a boiler or vat of hot water. Stir the milk slowly, so that it will heat evenly until it is heated to 160° and keep at that temperature for twenty minutes. Then remove and set in cold water. Stir the milk so that it will cool rapidly.

A Russell vat is the same apparatus, only made on a larger scale, with provisions for stirring by machinery and heating by steam.

Tuberculosis and consumption are the same disease, whether in man or animal.

WHEN SHOULD A COW BE BRED?

An Indiana subscriber asks this question and the answer to it is: At such time as will bring her fresh at the time desired. If a cow freshens in September and one is satisfied with that month, let service be withheld until December; if in June or July, and it is desirable to have the next calf in the spring, let her be served at first opportunity.

A New Mexico reader submits some analagous questions, and to him we say: One service is better than more; if not fruitful, repeat in three weeks; there is no way known of controlling sex of offspring; aversion to the male is the best evidence that a cow is in calf.

WEIGHING HAY.

Please tell us through HOARD'S DAIRYMAN of a practical method of weighing hay fed to cows. With grain, silage, etc., it is easy enough, but with hay, different.

Would it not be all right to let them have whatever they will clean up all right, of hay and other roughage, such as corn stover?

Omaha, Neb. B. B. C.

It is not expected, in other than experimental work where absolute accuracy is demanded, that all, or even any of the feed is to be habitually weighed. The different measures full of the different kinds of feed may be weighed occasionally, so that one can be practically certain of the amount in pounds, is all that is necessary in ordinary farm practice.

The only difference with hay and other coarse fodder, is the one suggested. Each cow should have all she will clean up, be the same more or less If the feeder wants to know how much this is, let him weigh a few "forkfulls", and thus educate himself to estimate very closely. We specify a certain number of pounds of fodder in our formulas, but this is only our estimate of the probable average amount required by the herd, and is given in order that the totals may appear.

TOO LATE NOW TO STOP MILKING.

I have a grade Jersey heifer three years old, and her second calf is due the 17th of March. She is now giving 7½ pounds milk per day. I am feeding at present, 20 pounds mixed hay and 5 pounds grain (bran with ⅙ oil meal) per day. Is the ration all right? Shall I continue to milk her right up to calving? How long before and how long after calving is the milk not fit for butter making, etc? W. L. R.

Newport, Me.

The above inquiry bears date of February 22nd, which is less than four weeks before the second calf is due. If a cow cannot go dry fully four weeks, it is better to continue milking without interruption. Twenty days before and five days after calving are the periods usually assigned for rejecting milk. The feed is as good as can be determined without special observation of results. If any change is necessary, it would be to in increase rather than decrease the grain.

FOUR OHIO QUESTIONS.—CRIMSON CLOVER.

1. How much seed is sown per acre? Is it sown with wheat or oat crop or is it sown alone? Does it make good hay or is it used for grazing only?

2. Should grain rations be reduced as a

cow declines in milk flow or should they be fed the same at all times?

3. Is it best to feed, say six pounds ground feed twice a day or to feed four pounds three times a day?

4. Are all your tabulated feed rations based on the amount for each feed or the amount to feed for the day?

Ohio. J. W. E.

1. Crimson clover may be sown at the rate of 6 to 12 lbs. per acre. It is an annual and is usually sown in the late summer or early fall and under favorable conditions lives over winter, starts early in the spring, and may be either plowed under as a fertilizer for corn or a little later cut for hay. It must be cut very early, before any of the heads begin to ripen, as otherwise certain saw-like, hairy protuberances develop which become a source of danger, especially to horses. It probably could be sown in the spring with wheat or oats and furnish fall grazing, but in that event would not live over winter. An excellent plan is to sow the clover at the last cultivation of the corn.

2. The grain part of the ration should be reduced as the cow begins to shrink. The true test is to watch the cow and apportion the feed according to her condition. When she commences to fatten unduly, it is evident she is receiving more feed than she can make profitable use of.

3. We think the better plan is to feed only twice a day, thus giving time for rumination and full digestion.

4. A ration is calculated to suffice for twenty-four hours.

WHICH BREED?

I am anxious to begin to improve my dairy by breeding it up to a better standard, but am at a loss to know just what breed to tie to.

I have a dairy of thirty-five cows; ship the milk to Philadelphia, where I wholesale it. Can you suggest a breed that would be most likely to give satisfaction where a large flow of good quality milk is desired, combined with a strong constitution?

Are the Ayrshires considered good dairy cows, and does their milk test well?

Norristown, Pa. R. C.

During the last few months our correspondents have frequently asked us the above question, and we have as frequently stated the impossibility of deciding, more especially as we cannot tell the manner of animal our correspondent prefers. "A large flow of good quality of milk is desired," our correspondent says. A well selected, carefully fed herd of natives will do that. And if he places at the head of his herd a bull of either one of the four dairy breeds, he will make no mistake, provided his bull is prepotent in dairy qualities. It is noticeable that the advanced dairymen who are successful in their work, look more to the individual cow than they do to breed, and depend on the test and scales rather than on pedigree. They take a good cow wherever they can find her and the kind of bull she is bred to depends more on the individual preference of the dairyman than any other factor.

The Ayrshires are a pronounced dairy breed, the milk ranking in richness between the Jerseys and Holsteins.

COTTAGE CHEESE.

Could you give us any information as to how to make cottage cheese? We want to make it out of both skim milk and butter milk. S. BROS.

La Porte Co., Ind.

Put the sour skim milk and butter milk in a pan or pail and set it in a kettle of water, and slowly warm it to not over 140° F. The temperature will depend on the quality of cheese wished. The higher the temperature the dryer and harder the cheese will be. The degree of sourness of the skim milk will also affect the product, so it is not possible to give exact temperatures. After the curd has separated, put it in a clean sack and hang up to drain, a little pressure will hasten things. It is usually salted and put up in small prints, wrapped in tin foil.

COLOR OF MILK.

Is the color of winter milk affected by the feed given the cows? I have a winter dairy of registered Jerseys giving 5% milk, which is shipped and sold in a distant city. We have complaints that our milk is whiter than 3% milk taken at the same dairy. Contrasting the condition and care given these herds with ours, I am at a loss to understand the reason for this.

Our cows are fed well eared silage, in perfect condition, timothy and clover hay, with balanced ration of bran, gluten and oil meal. They have water in their stalls, and are cared for according to the best ideas advocated in HOARD'S DAIRYMAN. The cows are well and the greater proportion fresh the past autumn and early winter. L.

Moravia, N. Y.

The color of milk depends partly on the feed and partly on the breed, and to some extent on the amount of sunshine given to the cows. Different animals also vary widely in this respect. In the summer when the cows are on green, succulent feed, the color is deepest, but in the winter, the milk is almost white. Guernsey milk is the only exception, but even that is not pronounced in color, during the winter months.

Contrary to common belief, the color is no indication of the richness. A highly colored milk may contain less fat than a pure white milk.

FISHY BUTTER.

Will you please give us your opinion as to the cause of butter turning "fishy" after being held a time? A. McC.

Montreal.

The so-called fishy flavor has been charged to a variety of causes. Neglecting to aerate the milk when strong tasting weeds are abundant; accepting milk for separation that is just on the edge of sourness; churning at too high a temperature; working and salting at high temperature, sometimes 80° to 90° F.

Anything in fact that will affect the keeping quality of the butter and cause it to change in quality rapidly, but more than anything else, any method of handling the milk, cream or butter that will cause it to become soft and slushy, during working and packing.

PLAIN TALKS ON BACTERIA AS APPLIED TO FARM PROBLEMS.

[By PROF. H. L. RUSSELL.]

Second Series, VI.

GLANDERS.

One of the most dreaded diseases that affect our domesticated animals, is glanders. This disease is highly contagious, affecting, under normal conditions, the solid hoofed animals, horse, ass and mule. Occasionally it attacks other species, man included. The disease is widely spread over almost the whole world, but is particularly severe in the warmer climates.

The disease manifests itself in two phases, phases that are so distinct in many ways, that they have been given separate names. One is the cutaneous, or skin affection, known as farcy; the other the derangement of the mucous surfaces of the air passages, to which is given the name glanders. The characteristic symptoms of the latter phase of the disease are the ulcers that are produced in the nasal and other mucous surfaces. These break and discharge, the disease germ being thus disseminated. The internal organs are also frequently involved. When the lymphatic system beneath the skin becomes involved, as it is very apt to do when the disease is spread throughout the system, inflammation sets in, which later gives rise to the suppurating tumors that end in the so called "farcy buds."

The disease may assume either a chronic or an acute phase. In fact, it is because of its presence in chronic cases that the percentage of affected animals is as large as it is, for the trouble in these cases is frequently not recognized until infection in other animals has occurred. In chronic cases the disease may sometimes be held in check for considerable periods, only to break out again at a later date. This is particularly noticeable in horses grown on western ranches. These animals may do well during the summer season, but with the advent of unfavorable weather, the disease frequently breaks out afresh.

CAUSE OF GLANDERS.

The inciting cause of glanders and farcy, is the glanders bacillus, *B. mallei*, an organism that develops luxuriantly in the animal body, but not outside under ordinary conditions. The germ is spread from animal to animal through the discharges from the mouth and nose.

The material containing the disease germ may be deposited on the surface of stalls and mangers, on hitching posts, or in watering troughs, or parts of the harness as bridles, bits, etc., and so in a variety of ways find its way into another herd. The organism producing the disease can retain its vitality in a dried condition for a considerable period, but not nearly as long as in a moist state. This fact is of material importance in explaining the distribution of the disease, for it is a recognized fact that the disease is apt to be spread more by means of polluted watering troughs, pails, etc., when the disease germ remains moist, than where it is dried. The danger from hitching posts is lessened from the fact that the disinfecting action of sunlight is added to that of drying, but even under these conditions, infectious material is not infrequently transmitted to other animals.

Sometimes the virus of the disease is transferred directly from one animal to another. This is possible where horses are herded or pastured together, as is often done in the western states. Under these conditions, a glandered animal may spread the disease much more rapidly than would be possible where the stock is kept separate, as in individual stalls.

DIAGNOSIS OF THE DISEASE.

In the early stages of the disease, it is often very difficult to accurately diagnose the disease by physical examination. This is especially true with the chronic type of the trouble. The nasal discharges, or enlarged glands, from which the disease derives its name, may often be wanting. In farcy, the symptoms of the disease may be more apparent, but it more frequently happens than not, that the malady cannot be recognized by simply the clinical appearance. Sometimes it is confounded with non-infectious inflammatory and ulcerative affections that may occur on the mucous surfaces.

Within recent years a method of diagnosis has been devised that does for glanders what tuberculin does for tuberculosis. This is the *mallein test*, so called because mallein is a product from the growth of bacillus mallei, the glanders microbe.

While mallein is made from the glanders bacilli and their growth products in cultures, still it does not contain any of the living germs, and therefore can not produce the disease. This substance is used in a similar way to tuberculin, being injected beneath the skin. In a horse that is free from any trace of glanders, no material change in condition is noted where mallein is used. In a horse affected with the disease, even in the earlier stages, or in the latent, chronic form, there is a marked reaction.

Three different conditions may be noted in varying degree:

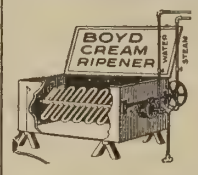
1. *Temperature reaction.*—A rise in temperature from 1.5°-2.5° F. will occur from eight to fifteen hours after the injection of mallein.

2. *Local reaction.*—At the point where the material is introduced, a swelling generally occurs that indicates a reaction in the tissues. This may persist for several days.

Food Caused Pain

Catarrh of the Stomach Cured by Hood's Sarsaparilla.

"I was taken sick about a year ago with catarrh of the stomach. At times I would have a ravenous appetite and at other times could not eat. My food caused me excruciating pain. I was running down so fast I had to stop work. My friends urged me to take Hood's Sarsaparilla. I did so and soon began to feel better. The disagreeable symptoms of disease gradually passed away and flesh and strength returned. I owe it all to Hood's Sarsaparilla." MARY L. CUMMINGS, North Brookfield, Mass. Remember



Hood's Sarsaparilla

Is the best—in fact the One True Blood Purifier. Sold by all druggists. $1; six for $5.

Hood's Pills cure Liver Ills; easy to take, easy to operate.

THE MILK MAN wants an Aerator, but he wants something more, he wants a cooler as well—aeration improves the flavor, but doesn't add to the keeping qualities of milk—it's the cooling that does that The CHAMPION Milk Cooler and Aerator does both; it's cheap, too. Get our book "Milk."

CHAMPION MILK COOLER CO.,
67 Main Street, - - CORTLAND, N. Y.

In addition to these, certain lymphatic glands in the proximity to the jaw are frequently enlarged.

3. *Constitutional reaction.*—A glanderous animal will generally show signs of marked constitutional disturbance, appearing dejected, and thoroughly sick. The pulse is usually rapid.

The use of this agent greatly facilitates the detection of the disease, especially in those cases that could not be recognized clinically. By using this test, it is thus possible to eradicate the disease from stock, whereas the old clinical methods of examination frequently left one or more animals in the herd to propagate the disease and so continue its spread. In many of the European states, the use of mallein is made compulsory.

The disease of glanders, unlike many others of a communicable character, does not protect an animal from a second attack. Not infrequently the disease may apparently heal itself, only to break out at a later date if the predisposing factors of climate and other conditions facilitate a development of the disease germ.

Concerning treatment of the disease but little can be said. It sometimes happens that the animal appears to gain the mastery over the disease as a result of natural causes, but not often is this permanent. In most states, animals that are proven to be glanderous are condemned and shot.

Cleanliness Essential to Good Butter Making.

[Paper read at the Sioux Falls Meeting by MRS J. L. STEWART, of Janesville, Minn.]

Creamery work to me is but another phase of housekeeping, and I would rather eat food cooked in a dirty kitchen by an unclean cook, than eat the butter or use the cream and milk from a dirty creamery or dairy operated by a dirty creameryman or dairyman.

Under ordinary conditions, milk always reveals bacterial life when examined in the proper manner, says Russell. If, however, it were possible to serve the milk in exactly the same condition as it is secreted, no microbes would be found in the milk from a healthy cow. In the process of withdrawing it from the udder it usually becomes contaminated.

The sources to which the bacterial contamination of milk may be ascribed vary greatly in different cases. From the time the milk is drawn until it is consumed, in one form or another, it is continually subjected to contamination from external sources. Milk is so admirably adapted for bacterial growth, that the organisms that gain an entrance into the dairy are usually those that preponderate in the fluid.

Of first importance are the vessels that are used during milking, and also all storage cans and other dairy utensils that come in contact with the milk after it is drawn.

As the usual by-products of the factory, skim milk and whey, are invariably rich in bacteria, owing to the high temperature at which they are separated, they should not be returned in the factory set of cans. It often happens that they are improperly cleaned, and, if so, the milk is richly seeded with these organisms from the whey or milk. A large proportion of the taints and troubles that bother factories are due to this direct cause.

Butter and cheese making both require the presence of bacteria, but the germ life must be of the right sort to be beneficial in its action. For this reason, the maker wishes the milk to be free as possible from all contaminating influences. If the milk is intelligently and properly handled on the farm, the raw material will be turned over to the factory in prime condition; but the rational treatment must be continued in the creamery if the best of products is to be expected. Numerous influences are at work in the factory that add their mite to the milk in different stages of its manufacture, and ultimately affect in a serious way the final product.

The cardinal precept in the factory, as well as in the farm dairy, should be cleanliness. Cleanliness here must not be taken to mean a mere absence of dirt and filth, but all utensils that come in actual contact with the milk should be rendered as germ free as possible. From the time the milk enters the weigh can, until the butter is in the tub, it should be remembered that many opportunities for infection are always present.

The germ content of milk, says Prof. Russel, varies so greatly that unless the conditions are all known, it is impossible to foretell what may be found therein. It is therefore highly important not only for the milk handler, but for the buttermaker that the germ life in milk should be reduced to the lowest possible number.

If for certain purposes more bacteria are needed in the milk, it is far better for the maker to add the desired forms himself as in a starter than to have the raw material infected through slovenly methods of handling.

The good qualities are dependent upon the relation of bacteria to cream. The germ content and the quality of ripened cream butter varies materially, depending upon the way the cream is handled.

The modern method of delivering the whole milk at the creamery and separating the cream from the milk by centrifugal force give the maker better control of the ripening process. Control of the ripening process exerts a profound influence on the character of the fermentation that takes place, and naturally modifies the product.

Thus we see that cleanliness is the one essential thing necessary for the production of good butter. Wherever we find dirt and filth, the false bacteria are sure to abound and affect the product in one stage or another of manufacture.

Let us then have for our watchword "Cleanliness," and in so doing improve the quality of our butter as well as improving the sanitary conditions of the creameries and farm dairies.

Gasoline Engine in the Dairy.

ED. HOARD'S DAIRYMAN:—In your issue of December 30th, "Buff Jersey" asks for experience of those who have used steam and gasoline engines for dairy purposes.

We have used a gasoline engine in connection with our dairy for the past two years, and in our estimation there is nothing that will equal it for dairy purposes. We use the power for separating our milk, churning our butter, grinding our corn, shelled corn, oats, barley, rye and other feed, also cutting our ensilage.

It takes from 30 to 60 minutes each morning and evening to separate our milk. After the milk has been taken to the basement of our dairy building, and the separator is put in readiness, our engine can be at full speed in two minutes; we then go to the basement, and no more attention is given it until our separating is finished, when we turn the switch and the engine stops (as does also our expense).

When everything is ready for churning, the engine is started, and we return to the basement and attend to our duties there, until such time as no more power is needed, when we touch the button and the engine and expense stops. The power from the engine is transmitted to a shaft in the engine room, from this shaft it is transmitted to our feed grinder in an adjoining room, also to another shaft in the basement, and from the basement shaft it is transmitted to the separator and churn.

Our ensilage cutter is located about 50 feet north of the dairy building. The shaft in the engine room extends through the north wall of the building sufficient to admit of a 12-inch pulley, from here it is transmitted to a tumbling rod 50 feet in length, which is attached to our ensilage cutter.

When cutting ensilage, we start our engine in the morning, and the engineer goes out and feeds the cutter. We are not troubled with heat, cobs, coal, wood, engineer, steam going down, no water, etc. Our engine is 10-horse power, and is supplied from a 50-gallon tank, encased in the ground about 20 feet from the engine room. We have small steam boiler in the wash room in the basement from which we get steam to wash our cans, pails, separator bowl, etc., etc.

It costs us ten cents per hour for gasoline, when we are cutting ensilage. Our cutter is an eight-horse power machine. For our work, we need the power one hour in the morning, one hour in the evening, and one or two hours during the day for grinding, churning, etc., etc. We think there is no power we could get equal to the gasoline engine. We touch the button and it does the rest. MORRILL & SON.

The Dual-Purpose Cow.

No. 3.

ED. HOARD'S DAIRYMAN:—If I have rightly understood the position of HOARD'S DAIRYMAN it claims that the dual-purpose cow cannot be bred with any certainty, that she is a product of accidental variation, that is to say, a sport. If this view is not correct I would like to be put right. My contention is that she is not necessarily a sport, but that in judicious hands she can be bred with as much certainty as a straight dairy cow or a straight beef cow. There is no recognized principal of breeding that is at variance with such a view. In this connection, however, I will admit two things, first, that in a great many instances in our country she has not been bred on any systematic plan, and second, that because of this some time must elapse before the average man would be as sure of results as he would be at a later period of systematic breeding. That so little attention has been given to the systematic breeding of this cow, at least in the United States, makes it all the more evident that when she is bred by system, as she may be, she will be a vastly superior animal to what she is now.

That the dual-purpose cow may be bred with as much certainty as any other kind of cow is demonstrated by the success which has attended the breeding of dairy Short-horns in England, by the high attainment reached by the Red Polls in England in the production of both meat and milk, and by the high attaiment of the Devons in the same country. Figures and facts may be given in support of this contention.

But in the meantime I realize that I am limited to only a certain amount of space. High attainment in both lines of production in a single herd would suffice to sustain the correctness of the contention that dual-purpose cattle can be bred with as much certainty as any other class of cattle. But, it is not necessary so to rest the proof on a single herd, since the breeds named can furnish herd after herd with such attainment. And the same is also measurably true of the Brown Swiss.

There is nothing in the recognized laws of breeding against such attainments. If it is true that some herds within a breed of cattle will milk much better than other herds in another breed, and will then fatten readily when dry, and if the same is true of an entire breed as is the case with the Red Polls, it is evident that the laws of breeding are not at variance with such attainment. If such attainment is possible in one instance, why is it not possible in ten thousand instances? I concede, however, that on the average farm, the farmer who brings together a herd of dual-purpose cows gathered promiscuously, and therefore of various blood elements, would not attain results from systematic breeding for dual-purpose cattle at the first, as he would at a later period. Until time enough elapsed to establish dominant characters, there would be less of certainty in the outcome, but ere long such uncertainty would be no more frequent in the herd than in a straight dairy herd. But this concession in no way lessens the force of the contention, that dual-purpose cattle may be bred with as much certainty as straight dairy cattle. So self-evident is this view to the writer, that I do not hesitate to say, that the man who affirms that dual-purpose cattle cannot be so bred, only holds up before the world his utter ignorance of the laws of breeding when he makes such an affirmation. And he deliberately shuts his eyes to attainment that has been achieved with the various classes of cattle named above.

That the returns from dairy cattle and their progeny are greater than from dual-purpose cattle and their progeny, has not been proved. At the outset of this controversy I threw down the challenge asking for such proof. No one, so far as I know, has taken up the gauntlet. It is not for me to furnish such proof. I am acting on the defensive. I am fighting for the existence of the dual-purpose cow, who has been denied the right to live. My contention is that the arable farmer who wants to grow beef and to sell his cream cannot do so without her, and that the man who tries to persuade him not to keep such a cow is not his friend.

Dairymen have tried to meet my challenge by quoting very large profits made from the sale of the milk of selected dairy herds. Such citations only support my view. I have always held that a selected dairy herd will bring a higher return in milk to the owner than a selected dual-purpose herd. But that only tells half the story. The other half has never yet been told, and until it is no one is justified in claiming that the all round profit from an average dairy herd is greater than the all round profit from an average dual-purpose herd. But suppose it were demonstrated that the net profit from a straight dairy herd is in the meantime greater, what would be gained by dairymen? Why, breeders of dual-purpose cattle would go straight into dairying, or at least many of them would, and what would this mean to the markets of dairy products? Then, the pendulum would begin to swing back again in the direction of beef growing.

I leave this question in the hands of the fair-minded reader. If my logic is defective, I will publicly thank any reader of HOARD'S DAIRYMAN who will conclusively show me that it is so. Is not that fair? But if it is not defective, then I claim that no man has any right to hold me up as an enemy of progress in dairying. I have not answered any of the many references made to me by the writers in the DAIRYMAN during recent months, for without exception they were based on a misapprehension of my position. Beyond all question the American public will soon ascertain where the truth lies in this controversy. If the experiment stations and the farmers find that the dual-purpose cow is a myth, a delusion and a snare, then all the worse for Shaw; but if they find that she is none of these, then all the worse for Hoard. THOS. SHAW.

University of Minnesota.

Guernsey Cattle.

ED. HOARD'S DAIRYMAN:—Please give a discription of the Guernseys, giving size, color, etc. Also, give the address of some one, or more than one, who advertises pure bred Guernseys for sale. Give those living nearest in the state.

Which would be the better cross with the Holstein, the Jersey or the Guernsey?

Will you also give the name and address of men having Short-horn (Durham) cattle for sale, giving those who have the best breeds for milk and beef. J. F. B.

South Dakota.

The Guernsey cattle are a sister breed to the Jerseys in many respects. Their original home, like the Jersey, is one of the Islands in the English channel near the coast of France. Like the Jersey, they have been specifically bred for a hundred years or more, to give milk rich in butter fat. They will average a little heavier in weight than the Jersey, and are different, somewhat, in outline and color. They are a very gentle and companionable breed of cattle, and excel all other breeds in the high yellow color of their milk and butter.

They are greatly liked by dairy farmers when they are fed and treated as dairy cattle should be.

We fear our correspondent is not a close reader of the DAIRYMAN, or he would see the names of a number of breeders of Guernsey cattle who advertise in its columns. They are all "good men and true", and we advise him to write them if he desires to purchase a bull. We would very gladly give the names of any Short-horn breeder who has cattle of *real profit* for the dairy, combined with beef, if we knew of any.

Filling the Silo.

ED. HOARD'S DAIRYMAN:—We think the trouble A. H. A., Blue Mound, Ill., is having with mouldy silage, is because he filled his silo too fast, and did not let each day's cutting heat before fresh corn was put in. We had the same trouble at first, but now have none. Fill your silo slow; keep it well packed, and let each day's cutting heat way through, (if it will not, cut every other day) and you will have no mouldy silage. The idea that the spots are where the man stands, is all bosh. Cut fine, one-half inch. Fill slow and pack well, and he will have no trouble. L.

New York.

Gluten Feed is used by nearly all successful dairymen, and has become a necessary article for any dairyman farmer who wishes to keep pace with the successful men in his line of business.

Gluten Feed increases the flow of milk, improves the quality, keeps the cattle in the best possible condition—in fact, helps you make more money out of your dairy. This is not cheap talk. We mean business. Gluten Feed is all and more than we claim for it, and, best of all, a trial proves it.

Sample of Gluten Feed, Milk Talk Pamphlet, and circular illustrating "Value of Butter Fat in Milk," all FREE if you address

Our Special Elgin Letter.

ED. HOARD'S DAIRYMAN:—The entire offering of butter on Monday's Elgin Board of Trade, aggregating 4,740 pounds was sold at 21 cents, all bids being at that figure. After the close of the call four lots of 1,500 lbs. each were sold on the floor at 20 cents. The Quotation Committee announced the market steady at 21 cents.

The following were the sales reported:

Factory.	*Pounds.*	*Price.*
Red Clover	1,800	21c.
McConnell	840	21c.
Cold Spring	2,100	21c.
FLOOR SALES.		
County Line	1,500	20c.
North Aurora	1,500	20c.
Bald Mound	1,500	20c.
Oswego	1,500	20c.
Total	10,740	

The sales for the corresponding week of the three preceding years were as follows:

Feb. 28, 1898, 6,600 lbs. of butter sold at 20c.
March 1, 1897, 34,860 lbs. of butter sold at 18c.
March 2, 1896, 59,280 lbs. of butter sold at 21@21c.

Elgin, Ill., Feb. 27 1899. H. C. B.

DAIRY MARKETS.

ELGIN, Ill., Feb. 27—Butter—Offerings 179 tubs. Sales, 100 tubs at 20c, 79 tubs at 21c. Official market steady. 21c.

CHICAGO, Ill., Feb. 27—Butter—Creamery, extra 20½@21c; firsts creamery, 19@20c; seconds 14@15c; dairies, selections, 17c; No. 1, 15@16c; No 2, 13c; extra, laules, 14c.

Eggs—At mark, cases included, 23½@27c, closed at 24@25c.

Cheese—Full cream, Twins, good to choice, 10 @10¼c; Cheddars, 9¾@ 0¼c; Young Americas, 10 @10½c; Swiss, 10@12c; Limburger, 8@10¼c; Bricks, 8½@10½c

Cattle—Trade was active and prices ruled strong to 10c higher. Receipts about reached expectations, but the quality was only fair. Strictly prime beeves would sell around $5.90@6. The highest price reported was $5 70 for some fed westerns. The corresponding Monday a year ago some cattle sold at $5 85, the highest during the first eight months of 1898. Native steers averaging 940@1,610 lbs. sold at $3.90@5.65, bulk, $4.60@5.30; straight Texas steers, 840@1,147 lbs, $3.90@4 60; native cows, $2@4.40 heifers, $2.85@4 65, bulls, $2.75@4 60; stags, $3 25@5; calves. $4@7; and feeding cattle, $3.50@4.60.

MILWAUKEE, Wis, Feb. 27—Butter—Creamery extras, per lb. 20@20½c; firsts, 18@19c seconds, 16@17c; imitations, 15@16c; fresh dairy, good to choice selections, 16@17c. Market unchanged and fairly active.

Cheese—Full cream Twins per lb. new, 10½@ 11c; Brick, 10@10½c; winter made, 9@9½c; Limburger, 9½@10c; winter made, 9c; Swiss block, 10½c; drum 12@13c.

Eggs—Fresh per dozen, 20c. Market weak 3@ 4c lower and unsettled, owing to a slow demand and steadily increasing receipts.

NEW YORK, Feb. 27—Butter 21c for western creamery; 20c for state dairy, half firkin tubs finest.

Cheese—10¾c for state large full cream.

Eggs—34c for western.

BALTIMORE, Md., Feb 27—Butter—Steady, fancy creamery, 22@23c; ladle, 15@16c; good ladle, 13@14c; store packed, 11@13c; rolls, 12@ 13c.

Eggs—Firm at 30c.

Cheese—Steady fancy New York large, 11@ 11¾c; medium, 11¼@11½c; small, 11½@11¾c.

KANSAS CITY, Mo., Feb 27—Butter—Active firm; Creamery, 16@20c; Dairy, 17c.

Eggs—Prices quoted 8c lower than Saturday. Fresh candled Missouri and Kansas stock, 20c cases returned; 20½c in new white wood cases, cases included. Receipts larger and the prospects of continued milder weather give reasons to expect abundant supplies and lower prices. The demand localy is very small.

ST. LOUIS, Mo, Feb. 27—Butter—Steady; creamery 19@23c; dairy, 14@17½c.

Eggs—Lower 23c.

PHILADELPHIA, Pa., Feb. 27 Butter—Solid packed separator creamery, extra, 22½c; creamery, firsts, 22c; creamery, seconds, 19@20c; imitation creamery, extra, 8c; imitation firsts, 17c; imitation seconds, 15c; ladle packed, extra, 15c; firsts, 14c; seconds, 13c; print butter, creamery, extra, 23c; firsts, 22c; seconds, 20c.

Eggs—Pennsylvania and near-by, 33c; Western, 34c; Southwestern, 33c.

CINCINNATI, O., Feb. 27—Butter—Easy.

Eggs—Demoralized, 22c.

Cheese—Strong; good to prime Ohio flats, 11 @11½c.

Latest quotations for fancy creamery: Newark, N. J., 21c; Buffalo, 23c; St. Paul, 20c; Minneapolis, 19½@20c.

NEW ORLEANS, Feb.27—Butter market quiet, 22@23c.

BOSTON, Mass, Feb. 27—Butter market very weak, 22c. Weather mild.

Cheese—Steady, 11@11¼c.

Eggs—Market demoralized.

DETROIT, Mich., Feb. 27—Butter—Elgin extras, 22c; Michigan. 2 c; dairy, fancy, 17c.

Eggs—Weak, 25c.

PITTSBURG, Pa., Feb. 27—Butter—Slow and lower. Creamery, 20@22c; country roll, 17@18.

Cheese—Scarce and higher. N. Y. creamery, 11½@12c; Ohios, 11@11½c.

Eggs—Market wild, 35@40c; sold up to 43@45 last week, but these prices will not hold.

NEW YORK MARKET.

NEW YORK, Feb. 28—Butter receipts for the week, 35,915 packages. Exports for the week 5,283 packages. The market has been steady all the week, with sales of extra creamery at 22c; good to fine selling at 20@21c; under grades moving at 17@19c. Best fresh imitations are enquired for at 16@18c; and we note sales of fine fresh ladle goods to exporters at 13@14c. Finest selections of new Dairy make from this state sold at 20@21c, but most of the tubs arriving however are lacking in quality over colored, mixed in color or bad flavor, and sold at lower and irregular prices. A June colored butter in March is unreasonable, hence if any coloring matter at all is used at this season of the year, it should be only a little to change the butter from a blank white. Summer make butter shows no improvement in price There were light sales of June freezer stock at 15@17c; small dairies of firkins and tubs at 14@15c; and we note sales of 100 packages odds and ends on New York State Dairy butter at 13c. We quote:

Creameries, extras, 22c; medium, 19@21c; poor, 16@18c. Dairies, extras, 20@21c; medium, 16@18c; poor, 12@14c.

Cheese—Receipts for the week, 11,219 boxes, exports for the week, 11,809 boxes.

There was more business done this week both for export and home trade. Buyers claim they were able to buy at less price than last week, while the receivers report a firm market at full prices and stocks clearing up to their satisfaction We quote: Full cream, small, extra, 11@ 11¼c; medium, 10@10½c; poor, 7@9c. Full cream large, 10¼@10½c; medium, 9@9½c: poor, 6@8c.

Eggs—Receipts for the week: 28,834 cases.

Prices have advanced 2 and 3 cents per dozen every day since our last and winds up to day (Saturday) at 35 cents asked and market bare of stock. Any increase in receipts would drop prices very materially. We quote: New York & Pennsylvania, 35c per dozen; Western, 35c per dozen. DAVID D. LEWIS & CO.

177 Chambers St.

BALTIMORE MARKET.

BALTIMORE, Md, Feb. 23—Butter—The embargo laid upon trade the previous week by the heavy snow was removed, and receipts of delayed shipments increased the regular supplies of creamery, as well as other grades, to such an extent that all wants have been fully met, and receivers have had their stocks that were depleted fully replenished, and the anxiety that prevailed as to the near future has vanished with the return of moderate weather. The proportion of the grade that goes for extras in the lines of separator creamery is still very small and the skill of the salesman is taxed to the utmost to persuade the buyers to take the selections at quotations; of course, the inferior and very faulty parcels have to be worked out by making liberal concessions in price. Gathered cream makes are in fair supply; and show more effects of the severe winter weather; some of the heretofore favorite and attractive marks have been rejected by the regular takers, and have had to compete for favor with the best ladles. Imitation creamery is scarce, the receipts falling far short of the demand although the quality is below the average for this time of the year. Ladles also are scarce, especially the high grades; there is no accumulation of any kind. Trading in Junes showed some little increase the early part of the week, but at the close sellers show some uneasiness about the final disposition of the holdings Blocks and prints again are in fair receipt, and the prices are easing off. Rolls are in fair receipt; the wire edge seems to be off; the demand continues good for all good to choice lots.

Creamery separator, extras, per pound, 22@23; firsts, 20@21; seconds, 18@19; gathered cream, extras, 19 firsts, 18; seconds, 17; Ohio, extras, 20@21; firsts, 19@20; seconds, 17@18. Roll, extras, 14@15; firsts, 13; seconds, 12. W. Va. Roll, extras, 13@14; firsts, 12; seconds, 11. Creamery Blocks, (2 lbs.) extras, 23@24; firsts, 21@22; seconds, 19@ 20; prints, (½ lb.), extras, 23@24; firsts, 20@21; seconds, 18@20. Md., Va. and Penna Prints, extras, 20; firsts, 18; seconds, 15@16

Cheese—Our cheese market is in good shape and firm with moderate offerings, and a good demand for desirable grades.

N. Y State Cheddars, fine, 11@11¼; choice, 10¾@10¾; fair, 7@8; Flats, fine, 11¼@11½; choice, 10½@10¾; fair, 7½@8½; small, fine, 11½ @11¾; choice, 10¾@11; fair, 8½@9. Ohio Flats, fine, 10@10½; choice, 9@9½; fair, 8@8½; Picnic, fine, 10½@10¾; choice, 9½@10; fair, 8½@8¾. Swiss cheese, fine, 11@12; choice, 9@10; fair, 8@ 8½c.

Eggs—Oh, my, did you hear the drop from the blizzard prices of last week? The break in prices took place on last Friday and Saturday, owing to the heavy receipts on those two days. Eggs were sold as low as 22 cents, but so far this week the receipts from all sections have been very light, and with our market quite bare of stock, prices have re-acted. We do not know how long these prices will hold; it will depend upon the receipts The demand to-day is active on all fine stock at outside quotations. Duck eggs—There is a good demand for all large clean stock; small and dirty eggs will not bring top prices. The market is active at 26 cents.

301 Exchange Place. G. M. LAMB & BRO.

FOREIGN MARKETS.

BOSTON, Mass, Feb. 25—Cable advices of this date from the principal markets of Great Britain to Geo. A. Cochrane, give butter markets as depressed, the weather being decidedly against the article. The arrivals of American this week are quite liberal, and being in so many hands, some of whom are pressing sale, causes a wide range of prices. Most holders, however, are looking for an improved state of things, with diminished receipts from America and gradual falling off of receipts from the antipodes, the weather will have more to do with future markets than anything else. Some very nice American creameries in boxes have sold close up to Canadians, say, 21@22c, but equal quality in tubs can be had at 19@20c. Medium grades of creamery are entirely neglected, margarine mixtures taking their place. The demand for finest fresh imitations is not so good this week as last, and it takes something very fine to command 16@17c. Ladles are a dragging sale at the moment at 15c downwards.

Cheese markets are not at all satisfactory to importers; to move quantity, concessions would have to be made that they do not feel like entertaining at the moment. Buyers continue most aggravating in their small purchases. Finest Septembers are nominally 10¾@11c, Canadian bringing ½c more.

LIVERPOOL, Feb. 27—Butter—Finest United States, 94s; good, 65s.

Cheese—American finest white and colored, 49s.

READING NOTICES.

For Sale—Two creamery outfits for sale, in whole or by the single article. Address C. E. NAPIER, Agent, Franklinville, Catt. Co., N. Y.

Improve Your Separators.

HAVE YOUR MACHINES REMODELED AND REPAIRED.

This is the best time for users of "Alpha" DeLaval separators to have their machines repaired, remodeled and brought up-to-date. The beginning of another season is at hand and our Shops can now do such work without the delay unavoidable a month or two later.

Separator users should understand the importance of both keeping their machines in good running shape at all times and of availing of later improvements as far as possible. It makes a great deal of difference in results when your machine is running roughly and out of order. Repairs should be very small and your machine always run smoothly with proper care, but when from any reason repairs are necessary remember that they very soon pay for themselves in better work, and that you are only going from bad to worse in putting them off.

Few users of older machines appreciate the extent and importance of later improvements and the degree to which such improvements are applicable to their machines. The capacities of all older machines can be materially increased. Increasing capacity not only largely increases their usefulness but also the thoroughness of skimming. The improved interior bowl construction is stronger and more stable and adds greatly to the durability of the machine. Any DeLaval machine of to-day is intrinsically worth double the same style of machine made two years or more ago. Many of the improvements can be incorporated into the older machines at reasonable cost.

In older "Alpha" No. 2 machines the capacity can be increased to 4,000 lbs. per hour, improved discs, stronger shaft, and disc strengthening ribs put in bowl, and bowl thoroughly repaired at a cost of $125. If the oil cups stand high they may be lowered. Sight-feed ones should be used. If running parts are overhauled at same time the machine will then be worth twice what it was before.

In "Alpha" No. 1 machines the capacity can be increased to 2,500 lbs., and the same bowl improvements and repairs made at a cost of $100. The bowl construction improvements can be made in ealier 2,500 lbs. bowls at reasonable expense. Every small bowl spindle machine can and should be remodeled in frame for present standard size of spindle. High setting oil cups may be lowered. Sight-feed ones should be used.

In "Baby" No. 3 machines earlier bowls can be remodeled and increased in capacity to 750 lbs., including thorough bowl repair, at a cost of $35 This makes new larger capacity covers necessary, costing $7. Sight-feed lubricators can and should be used. Many other little improvements can be made if machines are sent in to Shops, at reasonable cost.

In "Baby" No. 2 machines earlier bowls can be remodeled and increased in capacity to 375 lbs., including thorough bowl repair, at cost of $25. This makes new larger capacity covers necessary, costing $5. Sight-feed lubricators can and should be used. Larger supply cans may be had. Many other little improvements can be made if machines are sent in to Shops, at reasonable cost.

Write to New York or Chicago Offices, give the serial bowl number of your machine, and find how it can be improved and the probable cost. Do this either directly or through the nearest regular agent. Loan bowls can be had whenever wanted while bowls go to Shops. Loan machines, however, cannot be supplied.

Wanted—Position in dairy, 50 to 75 cows—buttermaker. H. MILLS, Highland, Mich.

Public Sale—Thursday, March 9th, ten registered Jerseys, lot of grade Guernsey cows and heifers. Fine 2-year-old Hood Farm bull at private sale or exchange. E. H. SMITH, Salem, N. J.

For Sale—A desirable farm of 120 acres, at Deronda Station, Polk Co., Wis. For particulars, write LOCK BOX 18, Deronda Station, Wis.

Position Wanted In a creamery by an experienced butter-maker. Have had 4 years experience and good success. Student of Wis. Dairy School. Good references. LEHNHERR, New Glarus, Wis

Wanted—A single man to work on dairy farm. Must be an expert milker, steady and of good habits. Also married man, same as above, for tenement house. State wages and give references. F. C. LAUER, Rochester, N. Y.

Dairymen, Attention! Excellent Opportunity—Established dairy business of eight years standing. Farm consists of 175 acres. Will sell all or part at very low figure, considering income from the dairy It is situated one half mile from main street of Milford, which has a population of 2,000, where all milk is delivered. Full information cheerfully given. Address T. J. CURDY, Milford, Mich.

Wanted—A first class butter maker. Live alone and milk 12 cows Wages $40.00 per month. Also a good milker wages $30 00 per month. F. E. ADAMS, Telluride, Colo.

Wanted—Position as butter maker, in Northern Iowa. Best of references furnished. Am capable of running any machine. Can do my own plumbing Wages reasonable. Address RICHARD KAUNZNER Fairfield, Rock Co., Wis. 3-2

Wanted—Industrious man with family who understands dairy farming. Good offer to the right party. J. C. RAY, Tampico, Mexico.

Wanted—To buy stock sheep. Some high grade or thoroughbred Shropshire ewes that will lamb this spring. Also wanted, a few Tamworth sows. FRANK O. CHESNEY, 302 Hall Bldg., Kansas City, Mo.

If you want to receive any one dollar book or a year's subscription to any one dollar magazine for 25 cents, address ELTON G. RICE & CO., Berwyn, Ill.

A Bargain—Full blood Jersey cows not registered, 2 and 3 years old, 8 head. Excellent breeding. H. M. EBBOTT,, Fort Atkinson, Wis. 3 tf

For Sale—Several DeLaval farm separators, or will exchange for cows or calves. Address P. M., Four Corners, Iowa.

Wanted—Location for creamery or cheese factory. I will build, buy or rent, or work by the month. Have ten years experience in butter making, and five years in cheese making. Address E. G. HODGES, Calhoun, Wis.

Creamery for Sale or Rent—The California creamery with first class outfit and all modern improvements. For particulars, address JOHN KELLER, G. W. BENNETT, Flat, Ohio

For Sale, Cheap—Dairy farm 116 acres near fine college. 2 houses, 3 barns, 3 silos. F. M. SWIFT, Olivet, Mich. 3-2

Position Wanted by a first-class and temperate butter-maker. Address L., care Hoard's Dairyman. 3-2

Wanted—A good working dairyman to take charge of 100 head of milch cows. Applicant must be thoroughly competent and not afraid of hard work. Address BONNE TERRE FARMING & CATLLE CO., Bonne Terre, Mo. 3-2

Position wanted in a cheese factory by an experienced cheese-maker. Have had 12 years experience and can give good references. Address P. O. BOX 96, Flat Rock, Ind.

For Sale—A first-class creamery 25 miles from Sioux City. Write for particulars and terms. DEWITT GOODRICH, Climbing Hill, Ia. 3-3

For Sale—8 can Champ. cabinet creamery, $15.00; 60 gal. "Ideal" bbl. churn, roller bearings, $6.00; 50 gal. cream vat, copper bottom, metal lined, ice or steam, $10.00; Eureka butter worker, $4.00; 20 cases of 5 lb. spruce Bradley butter boxes, 40c. case. J. T. CLARK, Clinton, Mich 2-2

Dairy school graduate wants work in creamery or dairy. Address "HOLT", Andover, Mass. 2-2

A Complete creamery outfit for sale cheap that has been used but very little. Address HABIGHORST BROS., Sheboygan Falls, Wis. 11f

Iowa Farms For Sale—$2 per acre cash, balance ½ crop until paid. J. MULHALL, Sioux City, Ia. 1-3

Hermanville Tamworths, Cross-heds, etc. J. A. MACDONALD, Hermanville Farm, P.E.I., Can. 32-52

For Sale—One first-class creamery and skimming station. DOWNING MFG. CO., Downing, Wis. 35-tf

An Entire Carload—Of high graded Jersey cows and heifers are in my hands for sale immediatley. F. H. MERRELL, Portage, Wis. 52-tf

For Sale—A very desirable and good paying dairy, consisting of 20 head, or more of Holstein graded cows; average milk sales of two hundred dollars per month. C. H. ELLIS, Waxahachie, Texas. 52-tf

Wanted—To trade a 43-acre farm, good six room cottage, and barn. Land rolling, and nearly surrounded by oil wells, producing from 10 to 400 bbls. per day, ½ to 3 miles away. Situated 10 miles from Parkersburg, 4 miles from railroad. Will be sold for high grade or full-blood Jerseys or $1,500.00 cash. This is cheap outside of the prospect for oil. Don't write unless you have first-class individuals. Also will sell or trade 416 acres of fine coal land in Kanawha county, 6 miles south of Charleston, Davis' Creek. R. R. runs through property. 95% of land underlaid with three seams of coal, one seam, 40 in., is free from any slate and with a bare trace of sulphur. There is no finer bituminous coal in West Va. Will take $5,000.00 worth of full-blood Jerseys and $5,000.00 in notes of one, two and three years. Titles guaranteed, J. F. WOODYARD, Parkersburg, West Virginia. 2-4

Lands in Wisconsin Cheap—The Chicago, St. Paul, Minneapolis & Omaha Railway Company has upwards of 400,000 acres for sale in northwestern part of the state at low prices and on long time. These lands are most desirable because of their proximity to the markets of Minneapolis, St. Paul, Ashland, Eau Claire, Duluth and Superior. If you wish to visit these lands homeseekers cheap excursion tickets can be secured at C. & N. W. ticket offices in Chicago, Milwaukee, Janesville, Beloit, Elgin, Aurora, St. Charles and Dixon March 7th and 21st. Maps and information furnished on application to G. W. BELL, Land Commissioner, Hudson, Wis. 8-4

Mr. Wheaton's Canadian Dairy Notes.

ED. HOARD'S DAIRYMAN:—Our last two letters contained summaries of the January Dairymen's Meetings. There is still another gathering of this kind to account for, and that not the least important one either. During the meeting of the western dairymen at London, in January, 1898, the cheese and butter makers of Western Ontario decided to form an organization for their own special benefit. The preliminary arrangements entered into at that time were confirmed, and the organization completed at a subsequent meeting held at Woodstock, in Feb., 1898.

This new organization, which has just recently celebrated its first birthday, is known as the Cheese and Buttermakers' Association of Western Ontario. It exists primarily for the makers, as only persons actively engaged in the making of butter or cheese are eligible for membership. So far, the association has had a rapid growth, and the bulk of the makers in the west have become members, and subscribed to the rules and regulations governing it. Though, practically, a maker's organization, its object is to foster the dairy industry as a whole, by elevating the position of the maker, and by bringing them in touch with each other, endeavor to remove some of the grievances under which they have labored, during the past few years.

A section of the dairy community may feel that makers, as such, have no grievances, and that from May 1st to Nov. 1st, or while the factories are in operation, it is all smooth sailing. But every one who has had anything to do with the management of a factory knows that many makers have very serious grievances at times. One of the things that has made the maker's lot a more or less hard one, is that too much responsibility has been saddled upon him. He is held responsible, at most factories, for the quality of the cheese, no matter what kind of milk is delivered by the patrons. In the light of the more recent investigations into the cause of bad flavors in milk this does not seem fair. To remedy this grievance, this new association has drawn up a new form of agreement for use between makers and cheese companies whereby the former is not held to be altogether responsible for the flavor of the cheese. It has also provided inspectors, who may be called in when there is a dispute as to how far the maker is responsible where inferior cheese are produced. The object of this is to place upon the patrons any loss which may result from cheese made from an inferior quality of milk.

Another grievance which the majority of our makers are suffering from is that of being underpaid for the work they do and the responsibilities they assume. This results, in many cases, in the maker not making enough to enable him to employ sufficient help to do his work properly. This the association will endeavor to remedy by granting certificates of workmanship to its members, and making an organized effort to educate factorymen in the way of paying a fair wage for good work. These objects should not antagonize the patrons, but on the other hand, cause them to rejoice in that there is in existence a new factor, pledged to do everything in its power to aid cheese and buttermaking in this country.

THE FIRST ANNUAL CONVENTION.

The first annual convention of this new organization took place at Listowel, Ont, on Feb. 1st and 2d, and was in every way a successful gathering. Mr. T. B. Millar, Kincardine, Ont., president of the association, in his annual address, outlined the work connected with its organization. In spite of the many drawbacks and discouragements, during the past season, cheese and buttermakers have not much to fear for the future. We cannot raise the price of cheese and butter, but we can improve the quality, and thus increase the demand. To make the finest butter and cheese, we must have men and women, who are desirous of attaining to the highest standard, a first-class quality of milk, and better buildings for making and curing the cheese in.

THE CARE OF MILK.

Mr. W. A. Bathwell, an Oxford county maker, read an excellent paper on this subject. He emphasized cleanliness, and that immediately after milking the milk should be well stirred and aerated until the animal heat was out. It should then be put in a sheltered, airy place, free from bad odors, to keep till taken to the factory. It should not be kept in large quantities over night, and should not be put in cold water till all the animal heat was out; and not then, unless in very hot weather, or when it is to be kept over Sunday. The fault for bad flavor lies, as a rule, with the patron who has control of the milk till it reaches the factory. He urged makers to reject milk which was not in a good condition for cheese making.

In the discussion which followed, the use of perforated tin vessels was recommended for straining the milk, rather than a cloth which was often conducive to uncleanliness. The cheese makers were fairly well posted, and if patrons would only do their duty thoroughly, there would be little danger of bad cheese. The people were not suffering so much from lack of knowledge, as from not doing what they knew.

SUMMER BUTTER MAKING.

In taking up this subject, Mr. Fred Dean, St. Marys, pointed out that there were no fixed rules for summer butter making. Cleanliness was the key note, and it ought to be observed all the way through. He advised pasteurizing the milk. In the discussion which followed, the ripening of the cream was emphasized as being a most important point. He who knew this, understood the most difficult part of butter making.

WINTER BUTTER MAKING.

Mr. J. F. Millar, St. George, in his address on this subject, showed that cream should be ripened at a temperature of from 70 to 75° F., or have the cream started to thicken in six hours from the time it had seperated. Quick ripening will improve the flavor of the butter. When cream is ripe it should be cooled to 60° F. in about an hour's time, then gradually down to 50 or 52° F, and should remain at that temperature for three or four hours before churning, in order to harden the globules of fat properly. Cream should be ripened ten or twelve hours before it is churned. Cream should be rich enough to churn 50° to 54° F., time to churn varying from fifty minutes to one hour. Churn until granules are as large as wheat grains. When butter is properly washed it should be allowed to stand for thirty minutes, at least, before working, and should be well worked, whether worked once or twice.

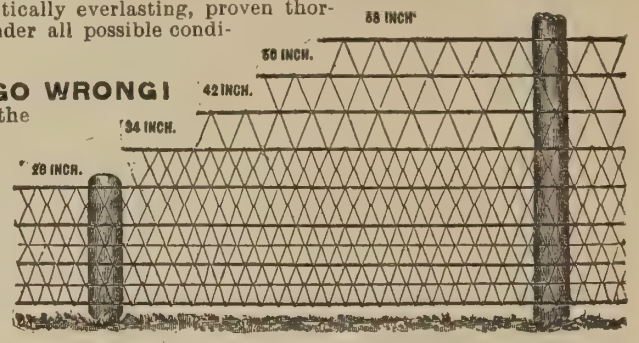
CHEESE MAKING.

This was one of the chief subjects for discussion at the meeting, which was led off by a very practical address by Mr. G. C. Publow, Instructor in cheese making at the Kingston Dairy School. It has been said that the limit of cheese making had been reached. This meant that the makers must make their cheese so fine that when the consumer tastes it he will want more. The chief faults were bad flavor and acid cut cheese, which was weak in body, and with a bitter flavor, the result of the condition of the milk and curing. In curing it was better to have two rooms and lower the temperature gradually. What the trade demanded to-day was a cheese with a sweet, nutty flavor and a silky texture. In the manufacture of such a cheese it was necessary to have a good factory to make it in, a good factory to cure it in, good milk to make it from, and an intelligent and skilled man to make it.

Practical addresses on other phases of dairying, were delivered by Professor Dean, Mark Sprague, T. J. Dillon, E. Agur, I. W. Steinhoff T. C. Rogers, and Geo. McDonald.

The following are the officers for 1899:—President, T. B. Millar, Kincardine; Vice-President, G. H. Barr, Sebringville. Directors, Geo. E. Goodhand, Milverton; John Brodie, Mapleton; E. Agur, Brownsville; T. E. Nimmo, Pine River; James Morrison, Stratford; T. O. Barry, Ingersoll; W. W. Brown, Atte cliffe Station. Inspectors, J. B. Millar and Jas. Morrison. Dairy Supt., W. W Harris, Brussels. Sec. and Treas., W. W. Brown, Attercliffe Station.

A new feature in connection with dairy conventions in this country, was a dairy exhibit. There were quite a number of entries in the cheese and butter classes. After the awards were made, one or two of the best lots were cut up and their good qualities pointed out to the members present. This



IF YOUR PASTURES AND FIELDS ARE INCLOSED WITH THE

ELLWOOD ALL STEEL WOVEN WIRE FENCE

you have secured absolute efficiency at least expense, in a practical fence that will positively turn cattle, horses, hogs and pigs. A fence that is strong, practically everlasting, proven thoroughly efficient under all possible conditions.

proved to be a most instructive feature of the proceedings.

INSTRUCTORS APPOINTED.

The directors of the Cheese and Butter Association, of Western Ontario, met recently and appointed four instructors to visit the cheese and butter factories under its jurisdiction. It was decided to appropriate $3,400 of the funds of the Association for this work, and visits will be made to factories making application for the instructor's services. It is the intention to have these instructors, as far as possible, reach the patrons of the factories, and instruct them in the care of the milk.

AGRICULTURIST AT THE EXPERIMENTAL FARM, OTTAWA.

This position, which has been vacant for a couple of years, has been filled by the appointment of Mr. J H. Grisdale. Mr. Grisdale is a Canadian, but has spent the past year at the Iowa Agricultural College, fitting himself for higher work in agriculture. When a student there last fall, he won first place in the live stock judging contest at Omaha. He has received a wide training during his agricultural studies, and should do good work in this new field. J. W. WHEATON.

Toronto, Canada.

The Milk Trust from a Farmer's Standpoint.

ED. HOARD'S DAIRYMAN: First of all, the producer and milk shipper would have nothing to lose but all to gain, judging from all the trouble that he has had for the last fifteen years or more. There are in Chicago hundreds of dealers in milk who make it a business to impose upon the milk producers in various ways, principally in not paying his bills. They are an irresponsible set who not only impose upon the farmer, but also on the consumer by giving milk of a very inferior quality, and in many cases they do not take proper care of it after receiving it from the farmers. Of course I take it for granted that the much talked of milk trust, headed by Mr. Joseph Leiter would be composed of the largest and best dealers in Chicago, or in other words the present talent of the business. They, together with Mr. Leiter's capital to buy out such retail routes as were desirable, and run them all under one management, which in this particular line of business would be very great, especially in the stopping of running many delivery wagons, and closing up of many of the smaller places of business of those the combination saw fit to buy out.

All of this great saving of expense would make it possible for them to pay liberally to all of such producers who would be up-to-date men in their line of business, and would be willing to take the greatest care of their milk possible, and bind themselves to feeding restrictions, State Veterinary Inspection, extra care of barns and stables, and in fact, run their dairies on modern dairy principles. He would feel that such a combination would pay their bills promptly and care for his cans while in the city as they should be. In fact, in my opinion, it would give new life to many of the now much abused milk shippers. And for this particular reason, since the source of supply is the all-important part of the business, the consumers would derive a direct benefit because their product would be handled by those who had the reputation and ability to run a clean, straight-forward retail and wholesale milk and cream business.

I say, as an old shipper of milk and farmer, let the trust come along. I can see nothing but elevation and betterment over the present state of affairs in our line.

I hereby extend a hand of welcome to Mr. Leiter and his milk trust. A FARMER.

Milwaukee County, Wis.

Richness of Cream—Dividing Returns Among Patrons.

ED. HOARD'S DAIRYMAN:—I am running a small creamery in Washington Co., Oregon, and receive both milk and cream, some of my patrons preferring to skim their own milk, using the deep setting gravity process. I use the Babcock test for testing the quality of both milk and cream and made an average of five pounds of butter to the 100 pounds of milk, received the month of January, and 21 9-10 pounds to the 100 pounds cream for the same month. One of my patrons thinks his cream don't test high enough; says he churned some himself and got a pound of butter from 3 ounces less cream than his average at creamery. I take composite tests and think cream is liable to vary even with the most careful skimming, while he thinks it should be the same every time. I use a bottle with large stem graduated to 25%, for testing cream, and small ones, graduated to 10% for milk. Now, I may not understand how to test properly, for all I know about it I learned from the party I bought creamery from, and count milk and cream on the same scale per 100 pounds, according to test. Would like to have you tell us through the DAIRYMAN if cream skimmed by gravity process, deep setting, is not liable to vary in quality even with most careful skimming?

2. The proper way to count amount of butter made from milk of different tests, Babcock testing machine being used.

J. J. HARTLEY.

Washington, Co., Oregon.

The richness of cream will vary widely according to the time and temperature of setting. It may contain anywhere from 10 to 40 per cent of fat, according to the above conditions. This variation was the main factor in causing the Babcock test to be invented and adopted in creamery work. Your patron might easily have found a variation of several pounds in testing two samples, instead of ounces, with no cause for surprise.

The *average* overrun is 15 per cent, but in practice it may be either above or below this amount. The fairest way is to divide the proceeds of the butter sold according to the per cent of fat brought by each man. Thus: If a patron brings 100 pounds of fat, by test, and the total amount of fat brought was 1,000 pounds, he would have brought 10 per cent of the total fat and is entitled to 10 per cent of the proceeds of the butter, after all expenses of manufacture have been taken out. The other patrons can be paid in the same way, according to the per cent of butter fat furnished.

WHEN YOU BUY A TESTER

you want one that will do absolutely correct work very rapidly, The

RUSSIAN BABCOCK TESTER

which is almost entirely automatic in every respect and has a speed indicator which will show you at a glance the proper speed, will fulfill all requirements. It is made entirely of cast iron, steel and brass, wearing parts are easily replaced when worn, and it has special glassware which is very easily cleaned and filled. HOT WATER IS ADDED WHEN THE MACHINE IS AT FULL SPEED. Exhaust steam from the motor keeps the bottles hot. All glassware guaranteed correct.

An Ontario Herd Record.

ED. HOARD'S DAIRYMAN:—I have just lately made up my milk record for the past ten months, of all my cows that have gone dry up to the 1st of February, since last year's record was made, on the 10th of last March. I cannot make up the full herd of 55 cows before the 1st of April, as they will not all have milked their full season before that time, but as this is the time of year when the Dairy Conventions and Farmers' Institutes are being held, I was often asked how my cows were doing this year, and a number of parties wished me to send them a record, so I have made up the record of 40 cows, taking them in regular course as they have gone dry, which I think is a fair average of the herd. The average, last year, of the entire herd of 55 cows, was 10,242 pounds; average time of milking, 11 months, 23 days; butter fat, 3½, and 418 pounds butter. This year they are doing considerably better, owing to having been better cared for and better fed during the summer months. Fed a half winter's ration of both ensilage and grain all summer, and we tried to protect them from the severe heat and flies during July and August, and continued to weed out all the poorer cows, and replace them with good heifers coming in, so that our milk record this year is showing a considerable improvement over last year, and we have been trying to improve every year since we started in to weigh each cow's milk once a week. Test the quality with Babcock tester once a month and keep a yearly record of every cow and weed out twelve to fifteen of the poorest milkers every year and replace them with good heifers, which we have coming in every year, as we raise all our best calves, and turn them either into beef or cows.

We commenced working on this system four years ago, also of providing green feed for the cows during a drought or very dry time during the mid-summer months, but last summer we made another great improvement by feeding our cows ensilage and grain all through the summer, when on either good or bad pasture; fed half a regular winter ration of both ensilage and grain. Cows like ensilage in hot as well as cold weather, even when on good pasture. We also added another improvement last year. In very hot weather we kept our cows in stable during the day and out in pasture at night, also washed them with a mixture called "Shoo-Fly," manufactured, I think, in Philadelphia. We put it on either with a brush or a spray pump, made for that purpose, applied it twice a week, which drove the horn-flies all off the cows. All of these improvements have had a good effect, in largely increasing the flow of milk, so that this season our cows have averaged 11,660 pounds of milk each, testing 3½% fat, making 476 pounds butter. Average time of milking, twelve months.

The average time of milking, twelve months, seems long, but that is caused by our milking our two-year-old heifer with first calf longer than we do the older cows, viz.: twelve to sixteen months. Cows weeded out for beef are also milked a longer period, which lengthens the average time on the whole herd. My best cow, number 56, is a cross. A Holstein bull crossed with a Shorthorn cow, being a half Holstein, half Shorthorn. She is now six years old. She gave first year, as a two-year-old, 10,100 pounds of milk in eleven months. Next year she gave 15,000 pounds in eleven months. Next year 17,740 pounds in ten months, twenty-one days, and this year, so far in ten months up to 1st Feb., 18,000 pounds of milk. Now giving 33 pounds per day, we intend milking her two and a half months longer, making twenty times her weight in milk in one year. The quality of her milk has averaged during the whole four years about 3 6-10%, running 12½ months. We expect she will give in the 12½ months, 20,000 pounds milk, nearly from 3 4-10 to 4% fat, which made into butter for the first year would be 424 pounds, second year, 630 pounds, third year, 745 pounds, and the fourth, this year, (the phenomenal), 840 pounds of butter from one cow in one year. In the four years she has given 62,840 pounds milk, making 2,639 pounds butter. You will not find many cows in America that have beaten this record. Now, this wonderful record has been brought about by good breeding, extra care and good feeding. Have a good, warm, well lighted, well ventilated, comfortable stable; roomy, single stalls, fresh, running, spring water and salt always before them; fastened with chain around neck, giving them freedom, allowed to run out for an hour or two twice a week on fine days, but kept in on stromy and bad or cold days.

We believe in feeding well, and find it pays to do so. We feed as follows: First thing in the morning, before milking, clover hay; after milking, feed 20 lbs. ensilage with 6 lbs. of grain feed put on top of it in the manger; at noon they are fed a little wheat or oat straw, for a change; at 4 p. m., just before milking, they are fed ensilage and grain, same as in the morning; and in the evening, after milking, fed clover hay. Grain feed, most generally consists of 6 lbs. bran, 3 lbs. pea meal, 2 lbs. cotton seed meal, average from 11 to 12 lbs. per day. Feed some cows more and some less, according to the amount of milk they are giving. Feed our best cow No 56, from 16 to 20 lbs. per day, according to amount of milk she is giving, same proportions and mixtures as the other cows. I may say, the different kinds of grain feed are well mixed before feeding, weigh out and mix up two days' ration at a time.

We sometimes feed oil cake meal in place of the cotton seed, and corn meal in place of pea meal, but prefer the cotton seed and pea meal, particularly in the summer season, as cotton seed fed in summer improves the quality of butter, makes it firmer. Now feeding corn meal in place of pea meal, for the reason that peas are so high in price this winter, costing from $7 to $8 per ton more than corn meal. Feed 2½ lbs. corn meal, 2½ lbs. cotton seed meal, with 6 lbs. bran per day. Our clover hay is good, well-saved, cut early on the green side, well cured in cocks covered with cotton hay caps, protecting hay from rain or dew whilst curing. Our daily winter ration is 40 lbs. ensilage and 10 to 12 lbs. of grain feed mixture per day. If cotton seed and oil cake were both the same price, we would feed both, half the quantity of each, but just now oil cake costs $7 to $8 per ton more than cotton seed meal, so that we are not feeding any oil cake to our cows this winter. We are greatly in favor of corn ensilage, both for winter and summer feed; find it to be the best, cheapest and most convenient for feeding, both for the summer, as well as winter. Last summer, we fed a half winter's ration of both ensilage and grain feed all summer, and the result was that our cows averaged 1,220 lbs. more milk this year than last. Milk worth $1 per 100 lbs. would net $12.20, the extra cost would be 20 lbs. ensilage at 10 cents per 100 lbs., 2 cents; 5 lbs. grain feed at 60 cents per 100 lbs. equals 3 cents, making the extra cost for summer feeding 5 cents per day per cow, and for the 150 days would be $7 50, deduct extra cost of feed $7 50 from the extra quantity of milk worth $12.20 would leave a net balance of $4.70 per cow, and for the 55 cows would be $258 50, net gain for the season, as the extra manure saved would more than pay for the extra labor in feeding.

In making the above estimate, I have left out my best cow, No. 56, which if included, would make still better showing of profits on summer feeding. You will see that I have not included my best cow, No. 56, in making up this year's record. By putting her in with the 40 would bring the yearly average up to 11,800 lbs. for this season, but as there are 14 cows yet to come into this year's record, which are still milking, we may find it necessary to put our best cow in with them in order to keep up the average of the herd of 55 cows to the 11,660 lbs. average as above stated.

We are greatly in favor of alfalfa clover for green summer feed, both for cows and pigs, which we have been growing for four years experimentally. We now have four acres. It produces wonderful crops. We cut four times a year and feed it green to our 300 hogs, once a day, and feed it to our cows once a day, alternately with ensilage once a day. Cows, like ourselves, like a change, and a variety of food.

I might add that we weighed each milking daily from our best cow for three months after she came in fresh on 4 h of April, 1898, and for the first month she averaged 88 lbs. milk, per day, testing 3.4 lbs. butter fat—3 lbs. fat or 3½ lbs. butter per day, or 21 lbs. butter fat, 24½ lbs. butter in 7 days. I see in the report of the dairy test at the International Exposition, at Omaha, last summer, the best record in the 7 days' test was 13½ lbs. butter fat, so you see I am a half better. Unfortunately my cow is not a pure-bred Holstein, and not allowed to compete for prize money. I forgot to mention that my herd of cows are mostly Holstein. One quarter of them pure-bred, the remainder ¾ to ⅞ Holstein blood, having used a pure-bred Holstein bull 15 years, first cross with Short horn cows. E. D. TILLSON

Ontario.

70 per cent of the blood of this great sire of dairy cows. He now has 69 daughters that have made from 32 lbs. 6 oz. to 14 lbs. of butter in seven days—a greater record than any other bull, living or dead. Solid fawn color. Dropped July 26, 1898. His grandam made 16 lbs. 4¼ oz. of butter in seven days. P. J. COGSWELL,
Rochester, N. Y.

THE Evergreen Farm Herd of A. J. C. C. Jerseys is now headed by St. Lambert of Brodhead, whose pedigree is unequaled in the northwest. We should be pleased to have anyone in want of Jerseys to write us for catalogue, stating just what is wanted. N. N. PALMER & SON, Brodhead, Wis.

A Maryland Herd Record.

ED HOARD'S DAIRYMAN:—I am very fond of your paper, it is worth more than its cost to a man, if he only keeps one cow.

I would like to tell the readers of your valuable paper what my cows have done the past year. But the last time I wrote, which was last March, I failed to see it in print. I thought you was looking for higher briers and better berries. Yet I have concluded to try again. I suppose the right name for my cows is scrubs; judging by the look of them, they belong to the 150 or 200-lb. class. May the Lord have mercy on the cow when her owner brings her down so low as that. I had four cows the whole year, and three part of the year, thus making it equal to 5 5-6 cows for the year. We make and sell butter. Have a DeLaval separator and think it can't be beat. Have no silo, wish I had one. Have no milk tester but contemplate getting one. Cow No. 1 was fresh Dec. 1, 1897, was two years old March 1, 1898. Cow No. 2 was fresh Nov. 3, 1897, milked her until Oct. 27, 1898, then sold her. No. 3, fresh March 10, 1898, milked whole year. No. 4, fresh April 28, 1898, milked all the year. No. 5, fresh April 16, 1898, milked all the year. No. 6, fresh June 1, 1898, bought her June 4th, used her milk from June 6. No. 7, fresh July 2, 1898, was two years old the following August. No. 4 and 5 have only been fresh twice. The calves we sell for veal, they have the whole milk for three or four weeks. We raise the heifer calves from some of the best cows. We have some heifers that look very promising.

The year ending Dec. 31st, 1898, we sold 1,875¾ lbs. butter, besides what was used in a family of three besides some hired help which, I think, made another 100 lbs. Mr. Editor, two years ago I was looking up some heifers, priced one in Michigan, the price asked was $50 for one two-year-old not bred. I thought her cheap enough but had no $50 then. I went and bought a black heifer, a bunch of bones that was springing, for $20, best of course. When she was three not four years old, from 255 lbs. milk churned 12½ lbs. butter in seven days. Then a friend said his neighbor had a heifer which he would sell for $18 when fresh if she came out all right. I bought her. When she was three not four years old gave 213 lbs. milk churned 13¼ lbs. butter in 7 days. Can you tell me how I could make more out of a $50 heifer? One cow we raised churned 12¾ lbs. butter in 7 days. One old cow after being fresh 6 months gave 169⅜ lbs. milk churned 9⅛ lbs. butter in 7 days, it was no force test, just fed and milked as usual only the milk separated separately. Our breeding has been, breed to the first male we come to, but at present have a grade Jersey. I am feeding 20 lbs. clover hay, 5 lbs. wheat bran, 3 lbs. corn and cob meal, some little corn stover, and all the wheat straw they want to eat. I have had a hard time getting three of my cows dry in the last 30 days.

CHARLES S. CONAWAY.

Carroll Co., Md.

A Michigan Cow Barn.

ED. HOARD'S DAIRYMAN:—Noticing in your paper a request for further description of our cow barn, the same is given herewith. I have tried to make it plain but it is not so easy to get a clear impression from a written description as by seeing the object described.

The length of building may be according to number of stalls required, but its width must be 30 feet. Central alley four feet wide, extends its entire length. Roller doors are at either end, one opening upon floor of main barn, the other outside the building.

The cows stand upon plank platforms at either side of central alley, facing it. At one end, next the main barn, is a roomy box stall and just across the alley from this is the feed room where ground grain and bran are stored. A driven well with pump is at one side the door of this room, conveniently located for use both in mixing feed and in watering stock.

The platform upon which the cows stand measures 7 feet 6 inches from the alley to manure trench at rear of stalls. Two feet of this is partitioned off for mangers, leaving five feet six inches where they stand. This proves to be about the right length for good sized Jerseys. When standing naturally in the stalls the hind feet come just to rear edge of platform. For smaller cows or heifers we arranged movable mangers, the animals standing back in the proper position and mangers adjusted to suit each one's length of body. We have never used a 2×4 or any thing of the kind across rear of stalls to keep them in desired position as it seemed to us that arrangement of this kind must be a source of inconvenience to the animals in lying down. The dividing partitions are from alley way back four feet and ten inches. This divides the mangers as well as the stalls so that each cow has her food entirely to herself.

The width of stalls and mangers is 3 feet 6 inches, thus allowing plenty of room for feed as well as for the cow. The alley is boarded up on each side four feet high to form back of mangers. On the side next the cows the center of manger is but eight inches deep for a space of ten inches, each side of that it is boarded up to a height 16 inches from the floor.

On each side the center of manger (next the cow) are upright pieces rising from the floor five feet to a two by four passing cross wise of stalls to which they are fastened. These are nailed flat against inside of manger for the cow to put her head between. They are oak boards 6 inches wide, one inch thick. They are ten inches apart at center front of manger and spread to 20 inches where they are fastened to the girt.

They also slant a little (as they rise) toward the rear of platform. To the inside of the upright at left of each animal, is fastened an iron rod one-half inch in diameter and 20 inches long, bent at the ends (which are flattened) so that when screwed fast to the upright the ring in the end of neck chain which is used in tying, will slip up and down thereon. This gives more liberty to the head when in the stalls.

The manure trench is 16 inches wide and 10 inches deep. It is made of oak planks and although in constant use for a period of eight years, shows no sign of decay.

Back of manure trench, next outer wall is a space three feet wide, filled in with coal cinders, and used as a passage way behind the cows. There are good sized windows every eight feet on either side the building (north and south) and sliding doors open into the barn yard.

All lumber used in the construction of this stable was taken from the farm and sawed at a neighboring mill. It is mostly oak. The exact cost it would be difficult to state under these conditions.

No separate grain boxes are provided with the mangers, as it has always been our practice to cut the rough feed and moisten it, adding the grain (which is ground) and mixing all together 12 to 24 hours before feeding. In this way it is put into the mangers together.

This stable is entirely satisfactory to the owner, and were we to build again no changes would be made, at least none of any importance.

We prefer a platform made for the cows to stand on of plank rather than cement. Plenty of straw is employed for bedding. Although the animals remain inside most of the time in cold weather, we have never had a case of injury to udders or to knees as is frequently reported as a result of accident.

Our stable is eight feet to floor above and has provision made for ventilation, although in this respect it is not quite so perfect as we would like. W. C. ROCKWOOD.

Good Returns from a Small Herd.

ED. HOARD'S DAIRYMAN:—I take great interest in the DAIRYMAN and have found it to be of much help to me in the work I have undertaken, a little over a year ago, and its valuable contents have done a great deal toward making my new enterprise an undoubted success.

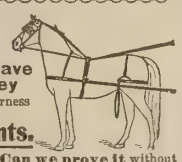
I am a mail carrier, and spend my spare time with my little dairy, consisting of six cows, and find it very interesting work.

I am inclined to think that when I first started my dairy that my cows were of the "dual-purpose" class, but I have changed them around to such an extent that for the past six months my dairy has consisted of, what I consider, through the valuable aid which I have obtained in information through the DAIRYMAN, all of the "special-purpose" class, and comparing the two classes, I will state that it would take several more cows such as I had the first six months of my experiment to give me the excellent results which has been attained by the splendid dairy which I now have.

The following figures will give an idea of the good results received from my little dairy in the past six months: I sell the milk all through the year, 22 quarts for $1.00. The smallest receipts for one month, in the past six months, was $79, and the largest receipts for one month were $86.54, so that you can see that I am being well repaid for the spare time which I give to the care of, what I consider, one of the nicest little dairies in the district.

I again wish to thank you for the valuable information gained through the DAIRYMAN, and wishing you success, I remain,

Chittenden Co., Vt. G. A. W.



Two Wagons at One Price.

It is a matter of great convenience and a saving of labor for a farmer to have a low, handy wagon. They save more than half the labor of loading in hauling manure, hay, grain, corn fodder, wood, stones, etc. The man who already has a wagon may have one of these low handy wagons at the small additional cost for a set of wheels. These Electric Steel Wheels, with either direct or stagger spokes, with broad faced tire, are made to fit any axle. You can convert your old wagon to a low, handy wagon in a few moments time. You thus virtually have two wagons at one price. Write to the Electric Wheel Co. Box 130 Quincy, Ill. for their catalogue; which fully explains about these and their Electric Handy Wagons, Electric Feed Cookers, etc.

WHY Can we Save You Money on a saddle, harness or vehicle!

Because we have no agents.

Can we really do it? **We say yes. Can we prove it** without cost to you? We can. **How?** We will ship you a harness, saddle, or vehicle, without you sending a single cent, and let you look it over at your freight house and if you don't find we have given you the **biggest bargain** you ever saw or heard of return the goods to us at our expense. **We give with each vehicle a 2-years iron-clad guarantee** protecting you against poor material and workmanship. Our vehicle catalogue describes the largest line of **buggies, road wagons, phaetons, surries, spring and farm wagons, carts, harnesses and saddles** ever shown in one book. **It's free. Send for it.**

Official Quotations for Elgin Butter.

In response to an inquiry, Mr. G. H. Gurler, Chairman of the Quotation Committee, of the Elgin Board, has sent the following letter:

ED. HOARD'S DAIRYMAN:—Your esteemed favor of the 14th received. Will say there is a Quotation Committee of five members to make official price each week at the close of the Call Board. This committee receive telegrams from the different markets at one o'clock p. m. of that day, and they make the price as they consider right, in comparison with the other markets. Their price don't always correspond with the sales made on the Board.

There are times when it may be to the advantage of some particular individual to boom that market for his personal benefit or lack of knowledge as to the conditions of the other markets. Such things have been done there, and could not be avoided. The Quotation Committee are to do away with that kind of element that used to make some bad breaks on the Board. We have found it much more sa isfactory.

Hope I have made it plain enough so you will understand the intention of the Committee. G. H. GURLER.

More Agricultural Improvement in Maryland.

ED. HOARD'S DAIRYMAN:—While we see much to deplore in the field of agriculture, and evidences of want of light and knowledge in so many places in farm management, the great possibilities that may be realized in most any branch of farm production, are frequently met with where intelligence is put into the methods that are used

In the southern portion of Maryland, in St. Mary's county, where many acres of land have been greatly depleted and run down by continuous years of tobacco growing, is a farm of 170 acres, that is an object lesson in soil improvement, that should carry conviction to every owner of land in that community, and in the state. Capt. R. W. Sylvester, president of the Maryland Agricultural College, bought this farm, a few years ago, and while he is teaching the boys at the college the science of agriculture, he is applying its beneficient principles to this poor farm, and his practice is as successful as is his teaching

The price paid for the farm was $900, or a little over $5.00 per acre. At the time this farm was purchased, its highest yield of corn was but two and one-half bushels per acre, while the highest yield of tobacco was 150 pounds per acre.

CRIMSON CLOVER AND PEAS.

The improvement of the soil began by sowing crimson clover early in the sp ing, upon which was turned sows with their pigs, and later one cow per acre, to be turned into beef. Later the clover was plowed down and peas drilled in, one bushel to the acre. When these were well grown, the pigs and cows were turned in to graze upon them, and in this way very cheaply and rapidly fattened. Under this system the land has been greatly improved. From twenty to twenty-five cows are now annually fattened, mainly on the clover and peas, while 6,000 p unds of pork are annually produced, with only a little grain finishing, the entire cost of food for hogs not exceeding $60.

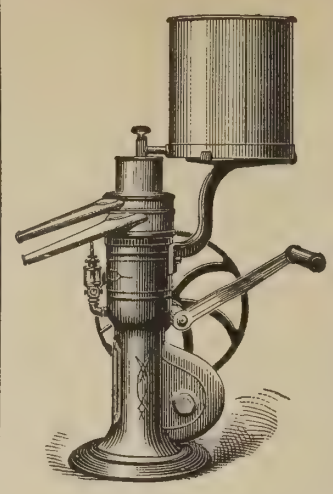
For seven successive years tobacco has been grown on the same land with crimson clover as an after cover crop. From 150 pounds, the yield has been brought up to 600 pounds per acre with no other fertilizer than the crimson clover, and an application of eight bushels of lime per acre. In seven years this farm has increased in value four times the original price paid for it, and it has been accomplished in a very inexpensive manner, with clover, peas, hogs and beef.

A few miles out from Baltimore is the farm of Samuel Shoemaker of 400 acres. Upon this farm, by far the finest dairy work in the state is done. The object here is to produce milk of the finest quality and of the greatest possible purity. The health of the cows is as carefully guarded, as that of members of the family. On every pleasant day they are turned out into a field, protected by a grove, and are kept in the sunshine as much as possible.

This is done to give them full opportunity to take pure air into their lungs, to give them strong vitality and active digestive power. There is no evidence of, or fear from tuberculosis in this herd of over fifty cows, made up of high grades, Short-horns, Jerseys and Guernseys, with some pure breds among them.

When the cows are outside, the stables are flushed with water, also the sides and ceilings, that the purest atmosphere may be had for the cows when they are again put in them.

The same care is extended to the food of the cows. The grass is cut when at its best, and secured in the best possible condition.



Bran is examined for adulteration, and only the best quality of oats and corn used. The men who work about horses, hogs, drawing out manure and the general farm work, are not allowed to enter the cow stable and milk in their working clothes, but have to put on a clean suit and wash their hands, before they are allowed to handle this milk.

The milk is handled with equal care, thoroughly aerated, and every utensil, bottle and can scalded and re-scalded until absolute cleanliness is secured. This may seem like unnecessary care, labor and expense, in the production of milk, but there are many consumers in cities who when they are assured that the milk they use is pure and free from all contagion from filth, from bad odors about stables, and impure air where the milk is handled, who are more than willing to pay ten to twelve cents a quart, as they do, for this milk, and use it abundantly, especially for children.

One of the best ways to increase the consumption of a food, is to establish a good degree of confidence in its wholesomeness and purity, and with its increased use will often come some enhancement in its value.

AN INTERESTING COMMUNITY OF FARMERS.

At Sandy Spring, Montgomery Co., seventeen miles from Washington, is a community of farmers representing the highest ideal in farm life. It is a settlement made up almost

entirely of those known as Friends or Quakers.

Over fifty years ago a number of families took up a large tract of land at this place, and they were attracted to it by the very fine growth of hard wood timber. The soil proved, however, very disappointing, and when cleared and put to growing crops, the yield was not above five bushels of wheat and ten bushels of corn to the acre. A farmers club was organized, and means were carefully discussed and considered how best to improve the soil, which was so much less productive than they expected to find it. This club is now fifty years old.

A woman's club was also organized, probably the first in the country, older than Sorosis, and the women very intelligently studied their part to be taken in the building up of that community.

THE RESULTS OBTAINED.

There is a community of prosperous, intelligent, highly cultivated and educated farmers' families, rarely to be met. Clover was used and fertilizers were studied and intelligently applied, until the soil has been made highly productive, yielding for many years 35 to 45 bushels of wheat, and corn 60 to 75 bushels per acre. From this improvement of the soil, these families have educated their children, and graduates from Swarthmore College are frequently met with in the sons and daughters. They have a public library, in addition to private libraries, while upon their tables will be found daily papers and magazines.

Their houses are connected by telephone, and they can converse with each other daily without leaving their homes. Many of their houses are furnished with bath rooms and closets and the modern improvements of city houses. They have stone roads, so that they can go to Washington with their produce, two to three tons to the load, at any season, while it is with expedition and comfort that they can go to each other's homes, their religious meetings, lectures, club meetings and post-office.

Here is a very marked illustration of what the soil will do for an individual, or for a community, if they will study its needs, and intelligently co-operate with it.

When will more of our farmers learn this all important lesson, to use the soil aright, and not abuse it; to so develop its possibilities as to get from it better living in every sense and the higher thinking that naturally results from better living.

A nation of farmers like these, who put their faith in the soil and show it by their works, who believe in industrial improvement, who would turn "swords into plough shares and spears into pruning hooks," would place agriculture before the world in its true position, and bring to such nation greater power, growth and wealth than countless ages of war and conquest, with all of its attendant destructive forces and influences.

GEO. T. POWELL.

Utilizing the Straw Product of the Farm.

ED. HOARD'S DAIRYMAN:—An item in Mr. Jennings' "New York Institute Echoes" in the DAIRYMAN for January 27, is worthy of "Note and Comment". It relates to what Mr. Smith saw while passing on the road and is as follows:

"Yesterday I saw men hauling baled straw a distance of five miles, over almost impassable roads, where they were to sell it for $3 00 per ton. It cost $1 00 to bale the straw and was worth $1 00 to haul it—twice tha. I should say—leaving $1.00 for the straw that contained $2.00 worth of fertilizers.

Such business methods will not make any money for the man who persists in pursuing them," says Mr. Smith.

Should think not, certainly.

It hardly seems possible that men—not a man—should pursue any such method as this, when so much better use could be made of the straw on the farm. It cannot be that such men read up-to-date farm literature, else they would pursue a different course.

Permit me to give a little experience on this point. Since keeping a winter dairy, we find no use for straw as a feed, but it is otherwise profitably disposed of.

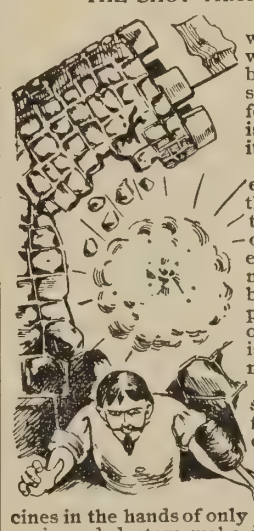
A part of the oat crop is made into hay, being cut quite green for the purpose. One feed a day is given, following that of ensilage in the morning, and it is eaten with a relish by the cows and without waste. Are just getting through with this kind of fodder and could use more to advantage if we had it. We consider this a profitable use to make of a portion of the oat crop and it prevents the over-accumulation of straw.

The rest of the straw—oat and barley—is used for bedding. That for the cows is run through a fodder cutter. In an hour enough to last a twenty cow stable can be cut. With it the cows are bedded twice a day and in this way are kept clean. We consider it better for this purpose than whole straw, both as bedding and an absorbent, besides being superior to handle in the manure.

Pigs and calves are kept to utilize the skim milk, butter-milk, etc. These are kept in roomy pens and we find it necessary and profitable to keep them well supplied with whole straw for bedding, and to absorb the liquids, of which there will be considerable, from animals fed on milk.

It requires quite an amount for this purpose and as a result the supply of manure is largely increased.

The horse stable is filled with horses for use on the farm and for other work, and these are liberally bedded with straw. This, with the manure, goes to another building used for swine, where it furnishes them with a comfortable bed, without extra cost, and is by them in turn worked over and comes out the best of fertilizers.



This is our method for disposing of straw, and as one object of stock keeping is the making of manure for the improvement of the farm and the production of more and better crops, it is found to be a profitable one, much better than selling it for a very small price, or undertaking to feed it to milch cows or young growing animals.

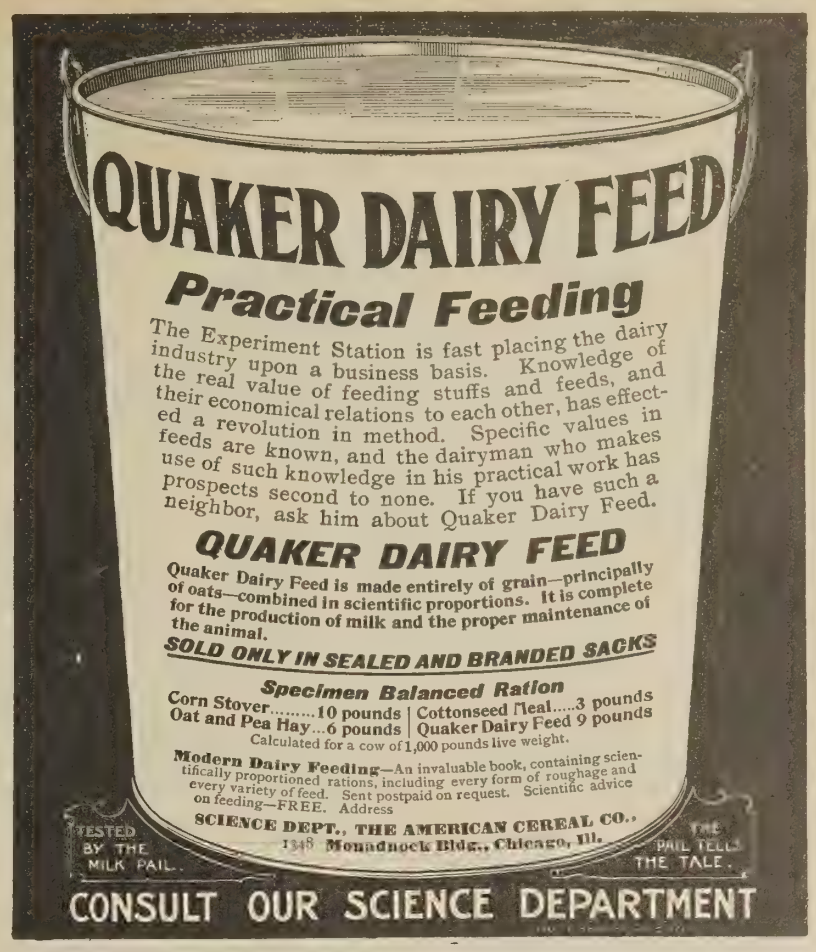
Sometimes we do not have straw enough for bedding and then sawdust is used instead for the cows. This makes nice clean bedding, fully as good as the cut straw, but, of course, is not as valuable in the manure, only so far as it can be used as an absorbent. When dry it will be found excellent for this purpose.

E. R. TOWLE.

Vermont.

THE SHOT THAT TELLS.

Do you know what happens when one of our big thirteen-inch shells strikes a fortification? It is fairly *lifted* off its foundations.



This is the modern way of doing things: concentrating every ounce of power and energy into one tremendous irresistible blow that simply annihilates opposition. This is the method that means success.

It is just the same in the warfare against disease. While all sorts of half-way compromising medicines in the hands of only partially experienced doctors make a feeble, "small-calibre" sort of resistance to the enemy, Dr. Pierce's magnificent "Golden Medical Discovery," with its splendid blood-purifying, liver-toning, strength-creating power, hurls the fortress of disease from its very foundations, and searches and drives out the lurking symptoms of weakness and debility from every secret hiding place in the entire physical system of mankind.

The work of this grand "Discovery" is thorough; it gives the health that is all health; the strength that is solid and substantial and lasting; not flabby fat; not false stimulus; but genuine, complete, renewed vitality and life-force.

"I had been a sufferer for fifteen years nearly all the time," says Mrs. Sarah E. Taylor, of Eureka, Greenwood Co., Kans., in a friendly letter to Dr. Pierce. "In August, 1896, was taken with severe cramping pain in my stomach. The doctor here said it was due to gall-stones. He relieved me for a short time, and then there was a hard lump about the size of a goose egg formed in my right side. It became so sore I could scarcely walk about the house, and I had no appetite. I consulted the best doctors in town and they said medicine would do me no good. I gave up all hope of ever getting well again.

"You advised me to take your 'Golden Medical Discovery' and 'Pleasant Pellets,' which I did according to directions. I began to feel better and my appetite came back. Now it is a little over a year since I began to do my own work. I am stronger than I have been for five years."

Spring Litters of Pigs...

Do you expect them? If you feed the sow *Wilbur's Stock Food* her delivery will be surer and safer and the pigs healthier. The food then fed will keep sow and pigs from disease and mixed with grain will fatten them for market better than anything else. F. B. Henry of Culbertson, Md., says:

"It is the best Food for hogs to be found. We are not able to recognize them as the same after two weeks' feeding."

If your feed dealer, harness maker, grocer or druggist doesn't keep it send 50 cents for a package containing 40 feeds and sample of White Rock Hoof Packing. Our booklet, "Pasture in Packages," tells how you can give your animal the benefit of pasture and at the same time keep him working or in the stable, tells how to keep up the cow's flow of milk, fatten the steers or hogs and save grain in feeding the animal.

Wilbur Stock Food Co.

SEEDS

THE ALBERT DICKINSON CO.
Timothy, Clover, Flax, Hungarian, Millet, Red Top, Blue Grass, Lawn Grass, Orchard Grass, Bird Seeds, Ensilage Corn, Pop Corn, Buckwheat, Field Peas, Etc.
Offices, Cor. Clark & Sixteenth Sts., CHICAGO, ILL.

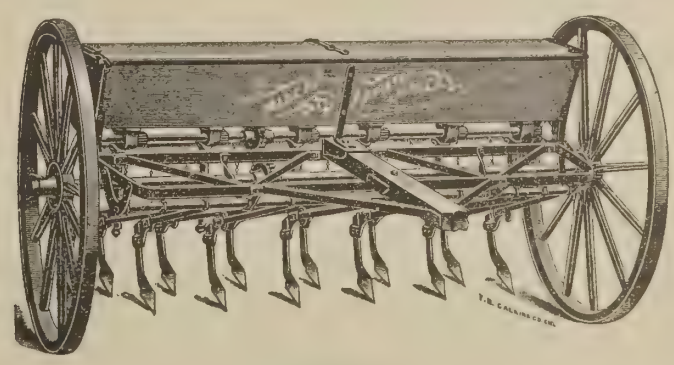

ILLUSTRATION.

The above cut illustrates the Badger Seeder, manufactured by the Appleton Mfg. Co. of Batavia, Illinois. The following are a few of its points of advantage, as claimed by the manufacturers:

It has Spring Hoes which automatically adjust themselves to rough and uneven ground. It has a continuous steel frame. It has steel drag bars. It is simple in construction, and easy to operate. It is strong and durable. "Badger" Seeders sold twenty years ago are still in use doing good work. In fact it has every advantage which can be claimed for any other seeder, and many which are exclusively its own. A complete description can be had by addressing, for circulars, the manufacturers at address given.

Sterilizing Skim Milk.

ED. HOARD'S DAIRYMAN:—Can you give me the address of one or more creameries using a home-made skim milk sterilizer, or can you publish a description of one for a large creamery. W. A. CHIPMAN.

Kossuth Co., Ia.

Will some of our subscribers, who have used such an apparatus, give us their experience.

Ripening Cream.

ED. HOARD'S DAIRYMAN:—I see there are many inquiries concerning the ripening of cream in winter, in the average farm dairy. I will give my method, which I have followed successfully for three years:

I use a tin can with a close cover; never use stone jars if you desire to make fine flavored butter. I keep the cream sweet until the evening before churning; then place the cream can in a vessel containing hot water, add the starter to the cream and stir the cream frequently until the temperature is raised to 75 degrees. Then set the cream in a warm corner by the kitchen stove, and in 12 to 15 hours it will be ripened. Churn at 60 or 62 degrees. V. D. R.

Johnson Co., Ind.

Premium List of Pennsylvania State Dairymen's Association.

PREMIUM LIST OF BUTTER.

Class A.—One package of creamery butter made in the state from milk of not less than five individual dairymen. Not less than 30 pounds. First prize, $5 00; second, highly commended.

Class B.—One package of dairy butter, not less than 10 pounds in prints, made in private dairy. First prize, $5.00; second, highly commended.

SPECIAL PRIZES.

Through the kindness of the manufactures of dairy supplies and apparatus, we are able to offer the following special prizes:

No. 1.—Offered by P M. Sharples, West Chester, Pa., a No. 1 Sharples Hand Separator for the highest scoring butter made from cream separated by Sharples separator in the craamery class.

No 2.—Offered by P. M. Sharples, West Chester, Pa. a No. 1 Sharples Hand Separator for the highest scoring butter made from cream separated by Sharples separator in the dairy class.

No. 3 —Offered by P. M Sharples, West Chester, Pa., a "No Tin" Babcock Tester for butter scoring the second highest made from cream separated with Sharples separator in creamery class.

No. 4.—Offered by P. M. Sharples, West Chester, Pa , a "No Tin" Babcock Tester, for butter scoring second highest made from cream separated with Sharples separator in butter class.

No. 5.—$10.00. if butter scoring the highest number of points in any and all classes is made from cream separated by the Improved United States Creamery Separator.

No. 6.—$5 00, if butter scoring the second highest number of points under same conditions, offered by the Vermont Farm Machine Co., of Bellows Falls, Vt.

No. 7.—Offered by Diamond Crystal Salt Co., $15.00 in cash for the highest scoring butter exhibited, providing the same is salted with Diamond Crystal Salt.

No. 8.—Offered by D. H. Burrell & Co., Little Falls, N Y., a "Facile" 8-Bottle Hand Tester for butter scoring highest colored with Hansen's Danish or Columbia butter color.

No. 9.—Offered by Wells, Richardson & Co. Creamery butter. To butter maker scoring highest, colored with Wells, Richardson & Co's., improved butter color, a solid gold medal, with name of winner engraved thereon.

No. 10.—To butter maker scoring second highest colored with Wells, Richardson & Co's., improved butter color. $5 00 in cash.

No. 11.—Dairy butter. To the highest scoring dairy butter colored with Wells, Richardson & Co's., improved butter color, $5'00 in cash.

No. 12—To second highest scoring dairy butter colored with Wells, Richardson & Co's., improved butter color, $1.00 in cash.

No 13.—Offered by the Thatcher Manufacturing Co., $10.00 in cash for the highest scoring creamery butter colored with Thatcher's Orange Butter Color.

RULES GOVERNING CONTEST.

1st.—Butter showing marks of tryer will not be allowed to compete for prizes.

2nd.—There shall be no marks or brands on the packages or cases that will indicate who is the manufacturer.

3rd.—No prizes shall be awarded butter scoring less than 90 points

4th.—No entry fee shall be charged, but every exhibitor must be a member of the Pennsylvania State Dairymen's Association in full standing.

5th.—The standard of perfection by which butter will be judged is as follows: Flavor, 45; texture, 25; color, 15; salting 10; packing, 5; finish, 5.

6th.—All scores are the property of the Pennsylvania State Dairymen's Association, to be pub lished as it sees fit.

Intending exhibitors may send their application for membership and their annual membership fee of one dollar to the secretary, who will furnish them with entry blanks.

Let all butter makers enter this contest, and receive the benefit of knowing how his goods stand in competion. Address all communication to Meadville, Pa. J. C. MCCLINTOCK, Sec.

CONCERNING OUR ADVERTISERS.

TEST OF HOLYOKE LEDA 2ND, 98893.

ED. HOARD'S DAIRYMAN:—Holyoke Leda 2nd, 98893, dropped April 5, 1893. Dropped her last calf August 11, 1898 For the seven days ending September 7, 1898, she gave 232 lbs., 4 oz. of milk that churned 14 lbs., 15 oz. of butter, salted 1 oz. to 1 lb., and worked ready for market. Holyoke Leda 2nd 98893 is a model dairy cow. She was sired by David of Glynllyn, 26760. She is out of Holyoke Leda, 52812, test 18 lbs.. 11½ oz. Owned by C. A. Sweet. A. J. KINDBERG, Tester.

Lone Tree Stock Farm, Greensburg, Indiana.

That reliable firm of seedsmen, Northrup, King & Co., of Minneapolis, Minn., have issued a catalogue for 1899 that is artistic in design and remarkably strong in its offers of farm, vegetable and flower seeds.

Their series of Primers on questions of interest to farmers is compi ed by the best authorities and are furnished free of charge, a feature which is greatly appreciated by their old customers, and will be by those who become their customers duriug the present year.

One of the many interesting features of their book is their flower seed mixture in connection with which liberal cash prizes are offered. Seven prizes for the greatest number of species produced from single package, three prizes for the best photographs of the gardens, three prizes for the best essays on how to grow the School Garden Flower mixture, etc. Their advertisement appears in another column.

HIGH GRADE WORK.

There is a great deal of kicking in the average creamery at the work done with the Babcock tester, and not without reason. As soon as the farmer gets keen enough to demand a tester in the creamery, he also wants to be credited with the last one-tenth of one per cent of butter fat that is in his milk, for he realizes that the one-tenth saved means several dollars in the course of the year. To meet the demand for a higher grade of work, the Elgin Manufacturing Co., of Elgin, Ill., has put on the market a Russian tester. It does work that can be relied on under all circumstances. This machine is run by the direct action of a jet of steam that also heats the bottles. It is so arranged that it does not need to be stopped when filling the bottles with water, and it requires only one-half the acid and half the milk in order to make a test. The tester is enameled and is fitted with a speed indicator, so that the operator knows exactly what he is doing.

The Lamb Wire Fence Co., of Adrain, Mich. make a fabric which possesses all the cardinal points of excellence in a fence, efficiency, durability, simplicity and a handsome appearance when erected

Efficient, in that it will turn all stock, horses, cattle, sheep or hogs without injury to either animals or fence; having a straight, heavy, upright frequent enough to prevent the spreading of laterals and rigid enough to prevent a hog nosing under the base wire and crowding through.

Durable, in that it is made from the best quality of galvanized hard steel wire in large sizes, not weakened by being bent, warped and twisted before it gets into service in the field.

Simple, in that it is complete in the roll, ready to stretch and staple as soon as the posts are set, 80 rods or more at a single pull, requiring but few posts to make a perfectly servicable fence, capable of bearing removal and re-erection in another locality, perfectly adaptable to hilly ground without cutting, bulging or drawing uprights out of perpendicular. An absolute equality of length in the laterals insuring an even pull, and a perfectly uniform tension when the fence is under strain.

VETERINARY.

Queries in this department answered by WM. HORNE, M. D. V. S., Janesville, Wis.

COW PHYSIC—Three-fourths to 1¼ pounds Epsom Salts (according to age and size of animals) and two ounces of best ground ginger. Pour over this three pints of boiling water. When at 105° F., give gradually as one dose.

VERMINOUS BRONCHITIS —NYMPHOMANIA.

Our calves seemed very well until about three weeks ago. They were taken sick with diarrhœa, and then it changed to a cold, or I would say pneumonia, which began with a slight cough, and then stuffed up in the lungs. The first calf was given laudanum for the bowel trouble, but did not seem to give much relief. The last calf did not have bowel trouble so bad, seemed to have the cold, which we doctored with a Blair's liniment, the same as we give a person, to break up a cold, but seemed to give little relief.

I have a four-year-old half Jersey heifer which had a calf last spring, and has been in heat at the regular times since, but do not get her in calf, although with a bull.

Ayrshire, Iowa. J. C.

ANSWER.

You have, in my opinion, verminous bronchitis. The diarrhœa was the affect of this disease, and not pneumonia. This is termed hoose, husk, etc. You do not give to me as good an account of the symptoms as you ought to do. Your pneumonia is the stuffing up of the air passage, etc. The Stringylus micurius is a parasite which affects calves, and is very fatal. Damp pastures and poor food are among the chief causes. Remove to a high, dry, airy location. Feed any of the oil cakes, in change from one to another, roots, ground feed, oats, corn, equal parts of sulphate of iron, gentian and ginger, well mixed, and given to ten calves of two to three months old, and less if younger, according to age and size. Each morning, give one tablespoonful of salt, at above age, etc. Disinfect and fumigate with burning sulphur and pitch. Confine in a room suitable for the purpose, but be careful not to make the fumes too strong. The person in charge must not leave the fumigation, but stay and watch closely from 20 to 30 minutes. Destroy by fire or bury all the excrements, and disinfect all and everything.

2. Your best and cheapest way will be to use some of the advertised cures for nymphomania, or give four dram doses of black haw, or two dram doses of false unicorn each morning for a few days, then rest 4 to 6 days, then repeat.

FAILURE TO BREED.

We are having a great deal of trouble in this particular vicinity to get cows to breed again after calving. They come in heat regularly, take bull all right, but do not seem to catch. We have examined two of these cases, and find the womb contracted and the mouth closed down tightly, and in both cases pointing down. We succeeded by the aid of a veterinarian in opening one cow, but the other we could not open only enough to get one finger into the neck of the womb.

Liberty, Ind. S. C. T. & SON.

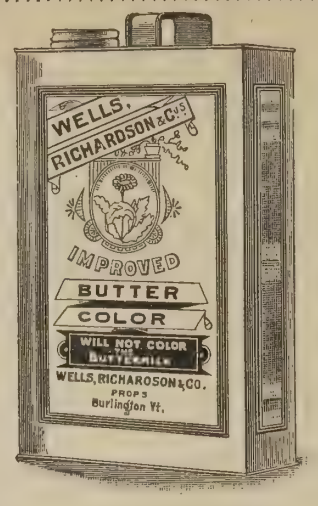
ANSWER.

The country is full of such cases. The os ought to be closed, except at particular times. No true veterinarian used mechanical force. Give same as above to stop coming in heat for several seasons, four to six, then stop the medicine, and serve the cow on the second day only once. Then keep from smell, sight or hearing of a bull, or a cow in heat.

TUMOR ON CHEEK.

Bull, five years old, has an enlargement on side of head below the eye, seemingly between the teeth and cheek, about the size of walnut.

I might say that last November I had a 4-year old that had the same enlargement, but on the other side of face, remained a few weeks and went away or disappeared quickly and nothing was done for it. The one affected now, otherwise is all right; bothers him perhaps some while eating small ears of corn. SUBSCRIBER.



Leaderville, O.

ANSWER.

Try the same remedy and if it does not go away, apply again. There may be a carious tooth or teeth. Let some one make a close examination and ascertain the fact and then act accordingly.

EFFECT OF ACONITE.

I had a valuable cow taken sick last Friday, during the night. When I came out to milk, Friday morning, she seemed weak and sick; she was lying down, but got up on her

PRACTICALLY

EVERYBODY USES IT.

At the Western Dairy meetings for season of 1898 and 1899, all the prize winners were users of WELLS, RICHARDSON & CO.'S IMPROVED BUTTER COLOR. With an era of better goods and better prices, why should not all buttermakers use the best color.

Send for FREE 320-page Agricultural Catalogue.

Marvin Smith Co., 55-57-59 N. Jefferson St. Y 18, Chicago.

feet when requested, but staggered some. After we got through milking she could not stand. I gave her 35 drops of aconite and sent f r a layman; he said milk fever, and recommended one-half pint of whiskey to warm her up, and 40 cr 50 drops of aconite every two hours, which treatment I followed all day Friday and Saturday forenoon; thinking she might be bound up, as there had nothing passed her bowels, I gave her ¾ of a pound of Epsom salts and two of ginger. In less than an hour she was worse, and never recovered; died Saturday night. I think the salts killed her, but can t make anybody else think so. I opened her and found her heart full of clotted blood, and lungs looked black and blood shot; her bowels were not packed, seemed in a healthy condition. A. D. C.

Dryden, N. Y.

ANSWER.

You gave aconite enough to kill four cows. The salts had nothing to do with her death, not the slightest. Thus another victim to malpractice.

INVERSION OF WOMB.

A neighbor of mine had a cow that dropped her calf the other night. (Her time was up) Everything went all right and they left her alone for about an hour and a half; when returning to attend to her, they found that her womb had inverted and filled with the involves, with the placenta hanging onto it. The cow was in good condition.

Amherst, Wis L S.

ANSWER.

Impossible to tell you the cause. There are many—usually straining in calving. Injuries from many causes. The only remedy I know of is to prevent the injuries. Inversion of the womb, termed among the laity, casting of the wethers, is a bad condition, and requires the presence of a practical man. I think not, though such might have happened.

NYMPHOMANIA.—CALF SCOURS.

I have a Jersev heifer that is fifteen months old. She came in heat and was served, went six weeks and was in heat again and was served and now has come in heat again for the third time, having run the six weeks the same as before.

I have seen several remedies in your valuable paper for scours in calf and have tried several of them without any benefit, now I have a new remedy and with me it's a sure cure.

When you prepare the skim milk for the calves, reduce the amount so that you can add one-third or a little more of new milk fresh from a cow, feed a few times this way and gradually diminish until they are entirely on the skim milk again, it works like magic. C. E. B.

Silver Springs, N. Y.

ANSWER.

You have a nymphomaniac animal. Select one of the best remedies you see advertised in the D IRYMAN, or give 4 drams of black haw and 2 drams of false unicorn, this is for a full grown cow, reduce for younger animals. To this add half a dram of gelsemium, 3 to 6 doses, three days between first and the last. Stop bulling.

CONSTIPATION.

I have a thoroughbred Jersey heifer 11 months old, that is habitually constipated, and for the last month she has been worse than usual. For six months, when on milk, I kept her in condition by adding to the milk scalded oil meal, but now oil meal fed up to ½ lb. a day with 2 qts. of bran, has no effect. She is get ing ½ peck of roots, and all the clover hay she will eat beside the grain. She has always had an abnormal desire to eat anything she can pick up, such as bits of paper and shavings, and will gnaw wood, and lick dirt and gravel. What is the proper dose of Epsom salts for an animal of this heifer's age, ½ lb. has no effect on her whatever. A. A.

Elizabeth, N. J.

ANSWER.

When a remedy in full dose does not act as a physic it is logically correct to increase the quantity. Give two drams of podophyllum—mandrake—each morning for three mornings. Then rest two days, then give the same dose for two mornings, then wait 3 days and give one dose. Then one dram every other day for a period of two weeks, or so. Put half a dram of nux vomica in every other dose, this is the best hepatic in the materia medica.

ACTINOMYCOSIS.—RUPTURED UDDER.

I have a thoroughbred Jersey heifer which has all the symptoms of big jaw, i. e., a large swelling under the jaw.

My neighbor has a valuable brood mare, which was not properly attended to when her last colt was weaned, and the result is that she has a burst udder from which milk, matter and corruption generally, are issuing.

La Conner, Wash. W. J. C.

ANSWER.

1 Get a competent person to examine the case. If it is actinomycosis there is no remedy, and if there was a cure, no sane man would attempt to propagate stock from such a contaminated animal.

2 Here again you need a practical man to examine the condition and act accordingly. Not knowing the conditions, I can't prescribe. Keep clean. All such cases as these need, and must have a personal attendant, who knows just what to do.

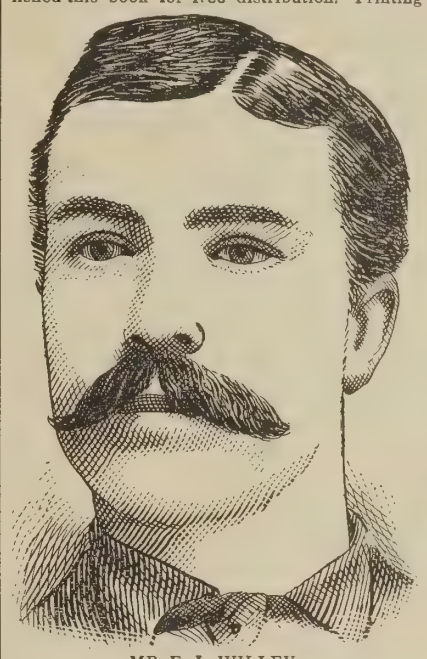
RETENTION OF PLACENTA. INSTRUCTIONS FOR REMOVING WANTED.

Have a thoroughbred Holstein heifer 21 months old. She gave birth to a deformed calf in December, that died the same day. She has not been in heat since, but has been discharging, the first month, quite a lot of pus, and it has not quit entirely yet, as she had a very hard and stubborn bag the first three weeks. I have given her some physic. She gives nearly 30 pounds good, rich milk a dav. Another cow gave birth to a calf only 8 months on her way; the calf lives, but the cow did not clean; had it taken away by a veterinarian. He did not get what it seemed to me half what he should, and, although four weeks have passed, she is discharging much light colored, and sometimes bloody matter. Does not come up to her full flow of milk yet. Could Dr. Horne not tell us how to take away the placenta? So many farmers live way off from where able veterinarians live, and they cannot always be had when wanted. I should think by a little advice, what we should loosen and how, a farmer ought to be able to do such a job.

Boyden, Ia. D. J DE T.

ANSWER.

There is never danger in giving physic to a strong cow. There is always a great chance for improvement when an alterative is needed. Physic her several times, good.



2 I would have to say as the musician said when asked by a friend to tell him how to play: Learn. It is a delicate thing to remove all the placenta when attached or otherwise abnormal. None but the ignorant believe removing the afterbirth to be simple. I can't tell you how to do this. It can be learned only by witnessing the operation performed by one experienced in such cases.

Rupture Book Free.

Home Method That Restores No Matter How Bad The Case.

Welcom Advice From A Well Known New York Specialist.

A prominent specialist in the cure of rupture has writen a book on the subject and tells how any sufferer can cure himself at home at slight expense. And the best of it is that he has published this book for free distribution. Printing

MR. F. L. WILLEY.

is, nowadays, such a rapid art that it doesn't cost a great deal to get out a neat book and give it away. The book is writen by Dr W. S Rice, 353 W. Main St., Adams, N. Y., and by merely send ng your name and address he will mail you a copy f ee of all cost. The portrait above is that of Mr F. L. Willey, Shelton, Wash., who was cured of rupture by Dr. Rice. Mr. Willey says:—"I sent to Dr. Rice for one of his books on rupture and found it very valuable. The information therein was the first real knowledge I had ever received that could convince me that rupture was a curable malady. I used his home treatment and am glad to say that my rupture was perfectly cured and that I haven't had any return or noticed any difference between the healed place and any other solid part of me. I was cured sound and well."

Readers are requested to write at once for this free book. No matter if you are wearing some kind of a truss that affords some relief send at once and learn all about the new home cure which Dr. Rice has clearly explained and fully illustrated, Write today and if you know others who are rup tured ask them to write. It contains advice that may save your life.

Potash.

ENOUGH of it must be contained in fertilizers, otherwise failure will surely result. See that it is there.

Silo Doors and Chutes.

ED. HOARD'S DAIRYMAN:—A few words in reply to request of Williams Bros., page 1,061 of your issue of Feb. 10th, as to the how of getting silage out of our silos.

Each silo is provided with four doors, one above another. The lowest one is four feet from bottom, the other three divide the remaining space equally to top of silo. Usually the silage will have settled so that very little digging out and throwing back is required to permit the removal of upper door, if not we throw over the top.

A four sided chute, constructed to hang easily in the door way, with gunny sack or burlap extension at the bottom reaching into the cart conveys the silage to that vehicle and prevents the lighter silage being scattered by the wind. GEO. T. VAN NORMAN.

West Newton, Mass.

The Ideal Farmer.

[From the Texas *Farm and Ranch.*]

The difference between the leader of an orchestra and the man who plays second fiddle, is that the one loves his business and the other only his weekly stipend; one works for fame and the other for bread. The man who saws catgut, or saws wood, and is not in love with his business, never rises above the condition of a common laborer. Enthusiasm is necessary to success in every field of effort. No man can become an ideal farmer who does not love farming, and especially his own farm. It is not necessary that a woman be both beautiful and rich to inspire love in the heart of her husband. The same may be truthfully said of the ties that exist between the farm and the farmer. A man may love his wife because she is his wife; so a farmer should love his farm because it is his farm, and is and will be what he makes it. Whatever its physical features, it can be made lovely in the eye of him whom it nourishes and shelters; and it is equally true that when love does not exist, there will be neglect and dissatisfaction, whether between man and wife or between farm and farmer. "Money makes the mare go," but it is pride of possession, and the natural affection that should exist between man and his faithful servant, that keeps the mare fat and sleek, and enables her to continue going.

To be proprietor of a piece of God's earth large enough to feed and comfort a family, and large enough to afford free air and wholesome exercise to all the living creatures it nourishes, is a thing to be proud of. If it is not adorned with natural beauty, adorn it. If the soil is not naturally fertile, generously fertilize it. One of the most lovable women the writer ever knew, wore red hair and four hundred freckles. Culture and conscience had made ornaments of what, in others, were blemishes. A farmer who loves his farm home will make it beautiful, though located on a piney woods hillside.

But love of home and farm is not sufficient to make an ideal farmer. He must have enthusiasm. No man ever achieved distinction in any calling without enthusiasm. The farmer who hurries home from the country festival that he may see if his seeds are coming up, to see how much this crop or that one has grown; who loves to exhibit to admiring friends the beauty and graceful movements of his favorite colt; who talks respectfully to and caresses his milch cow; who rises in the morning before the crowing of the cock that he may work upon his plans for improving his estate, may be depended upon to become an ideal farmer. He will find no time to whittle goods boxes, and little for the discussion of current politics with the ward heelers of his market town. His heart is where his treasures are, and his farm and family being his treasures, there his interests center and thither his tracks tend. His time and talent will be taken up and fully occupied with work and plans for the improvement of his farm and the comfort of himself and family, and domestic animals. Love of home is one of the noblest instincts of humanity. To a right-thinking man, the place where all the fondest emotions of life were exercised, where his children were born, where they prattled and played, where they grew to manhood and womanhood, and where, perhaps, some of them sleep beneath the green sod, must be a hallowed spot though ever so humble, and if so, the chief effort of his life will be to cherish and benefit and beautify such a home. For this purpose a large bank account is very useful, but by no means essential. Love of home, enthusiasm in his work, and energy of mind and body will ultimately effect their perfect work, and the result will, sooner or later, be an ideal farm and an ideal farmer, not, perhaps, according to the estimate of sordid avarice, but strictly in accordance with the ideal of Texas *Farm and Ranch*

WHAT STATISTICS HAVE PROVEN!

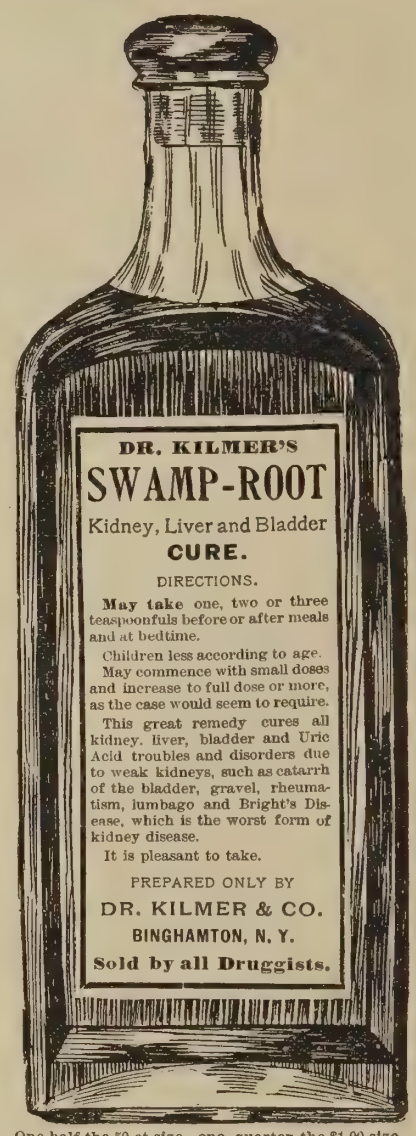
What Medical Science Has Accomplished!

THIS GREAT DISCOVERY IS OFFERED FREE TO DAIRYMAN READERS.

Statistics prove that more people are brought to the grave by diseases of the kidneys and bladder than by any other disease.

Kidney trouble is in itself so insidious and deceptive that thousands have some form of it and never suspect it.

For many years medical science has been trying to discover some remedy that would positively overcome these dangerous troubles.



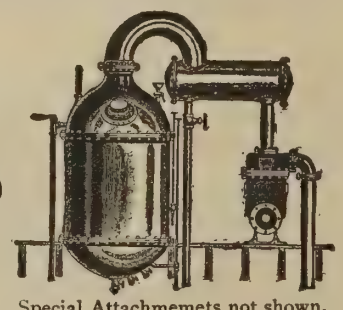
But not until recently was the discovery made. Doctor Kilmer, the eminent physician and scientist, after years of study and research, and after test on test that never varied in the grand result, announced the discovery of Swamp-Root, which has proven itself a most wonderful cure for all diseases of the kidneys and bladder.

While Swamp-Root has proved such a remarkable success in curing kidney and bladder diseases, it has also proved equally invaluable in the cure of blood diseases, rheumatism, liver and stomach troubles, and in the regulation and cure of all uric acid troubles.

Swamp-Root has been tested in so many ways, in hospital work, in private practice, among the helpless too poor to purchase relief, and has proved so successful in every case that a special arrangement has been made by which all readers of the DAIRYMAN who have not already tried it, may have a free sample bottle of Swamp-Root and thus test for themselves its wonderful curative properties.

If you will send your name and full address to Dr. Kilmer & Co. Binghamton, N. Y., a sample bottle will be sent, absolutely free by mail, postpaid, also a book telling more about Swamp-Root, and containing some of the thousands upon thousands of testimonial letters received from people who owe their good health, in fact, their very lives, to the wonderful curative properties of Swamp-Root.

This great modern discovery is for sale at most drug stores in fifty-cent and one dollar sizes. Don't make any mistake, but make a note of the name, SWAMP-ROOT, Dr. Kilmer's Swamp-Root, and remember that it is prepared only by Dr. Kilmer & Co., Binghamton, N. Y.



One half the 50 ct size—one quarter the $1.00 size.

If you take advantage of this generous offer, and write for a free sample bottle be sure and mention HOARD'S DAIRYMAN when sending your address to Dr. Kilmer & Co., Binghamton, N Y.

Built Complete By

Special Attachmemets not shown.

C. T. ROGERS & SONS, Detroit, Mich., U. S. A.

We are the only firm that builds factories complete, put them in operation and guarantee results.

Hoe Four Rows at Once.

That's the way farmers make money with "PLANET JR." tools. The new Four-row Beet-hoe does for the farmer what four sewing-machines in one would do for his wife. The Two-row Pivot-wheel Cultivator is even more remarkable for its range of work. The Hand-drills and Wheel-hoes have revolutionized gardening.

The new "PLANET JR." catalogue this year shows pictures of these money-making tools at work all over the world—in French vineyards, in California orange groves, in Jersey truck patches, in Manitoba gardens. It's the most interesting and inspiring implement catalogue ever published—and it's FREE. Write us for a copy.

THE AMERICAN WELL WORKS

AURORA, ILL. - CHICAGO. - DALLAS, TEX.

STANLEY'S CORRUGATED STEEL HINGES

are not like other hinges; they are better. Why? Well, because they are corrugated, which is just like so much re-inforcing; makes them at least 50% stronger, just as angle steel is stronger than flat steel. Are so made they can't bind on the pin even if hinge gets rusty. Are ornamental too. Don't be satisfied till you know all about them. Ask your dealer or send to us for circulars, &c.

THE STANLEY WORKS, Box 12, NEW BRITAIN, CONN.

THE FOUR BURR MILL

Two mills in one with two sets of burrs, the largest ever made, 25 to 30 in. in diameter (four burrs) all grinding at once, having double the grinding surface, and double the grinding capacity of other mills, also double the durability. We manufacture the largest and best line of sweep mills sold, including the famous Iowa Mill No. 2 for $13.00. Get our catalogue before paying two prices for an inferior mill. Agents wanted. Manufactured and sold by the IOWA GRINDER & STEAMER WORKS, Waterloo, Iowa.

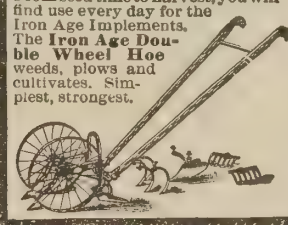
ROUND OR FLAT FINGERS. Which are Best?

NO GOOD JUDGE decides a case until BOTH sides have been heard. Neither should YOU. Read and BELIEVE all that other manufacturers say of the value of a GOOD weeder in the field, but before buying ANY weeder see what WE have to say about

BREED'S new "VICTOR" WEEDER with ROUND FINGERS,

then decide in favor of the one you think is best AND BUY IT.

Twelve years of PERFECT success with ROUND FINGERS enables us to



GUARANTEE that our "Victor" Weeder will do BETTER work in ALL crops and EVERY spot and place than any other shape or make, and that they will do GOOD work where others will not work at all. When one does not do so it may be returned and we will refund the entire cost to you.

☞ Agents wanted everywhere. First Weeder in a town at special price, and you have the agency if you want it. Write TO-DAY for our circulars. THEY MAY SAVE YOU DOLLARS.

THE Z BREED WEEDER CO.,

265 Merchants Row, - - BOSTON, MASS.

From seed time to harvest, you will find use every day for the Iron Age Implements. The **Iron Age Double Wheel Hoe** weeds, plows and cultivates. Simplest, strongest.

Iron Age Crops

Every ounce of "push" on the **Iron Age Double Wheel Hoe** goes direct to the work. No power is lost. It wins the battle with weeds and saves a hired man's wages. Like all the famous IRON AGE implements it has been perfected by 63 years of constant study and successful manufacture of farm and garden implements. Farmers without it cannot compete with those who use it. The handsome **Iron Age Book** for '99 describes them all. We will send it *free.* Distributing points conveniently located.

Bateman Mfg. Co., Box 153, Grenloch, N.J.

FEED MILLS

We make over 85 sizes and styles of **Buhr Stone Mills,** 2 horse power and up. It has been our specialty for nearly fifty years. A buhr stone mill is the best and only mill suitable for all kinds of grinding on the farm. Easiest kept in order, lasts a lifetime, large capacity, less power.

Get our new book on Mills before you buy. It will pay you.

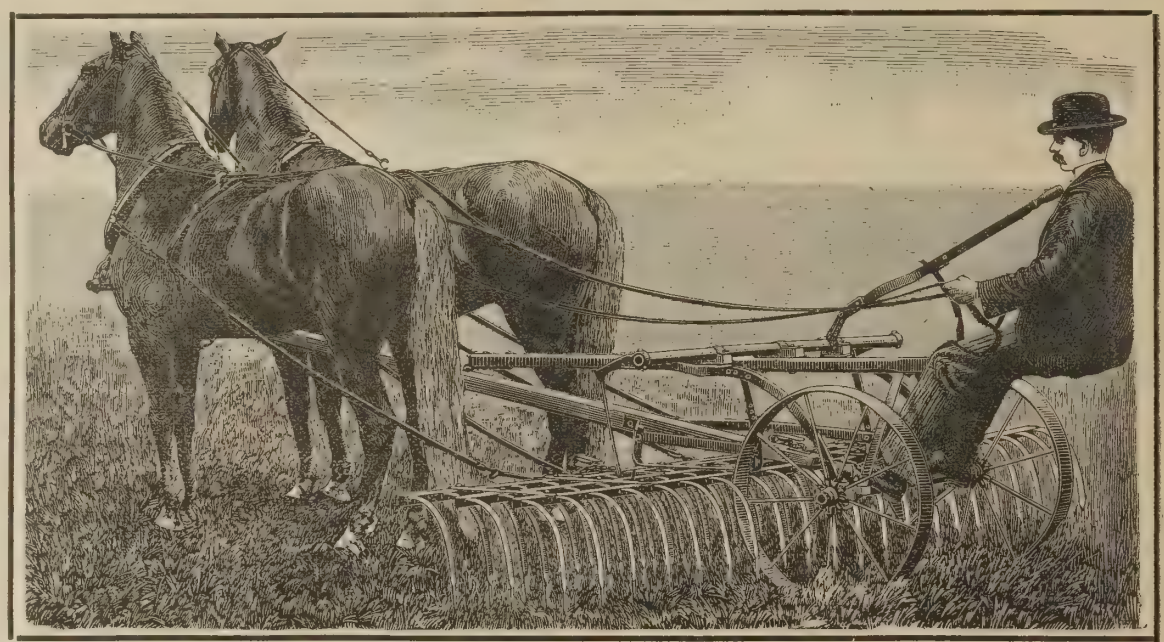
M. RUMELY CO., La Porte, Ind.

Hallock's Success Anti-Clog Weeder And Cultivator

The most practical and profitable machine ever invented for both weeding and cultivating all kinds of crops. Almost doubles the yield; does more and better work and saves more money than any other implement ever made for the purpose. Write at once for full information and sheets of testimonials from progressive and prosperous farmers in every state. (*$100 reward for any testimonial proven to be false.*) Read what those who have used it say about it.

"Hallock's Success Anti-Clog Weeder does all that your circulars claim for it. I have used it on everything, **onions, melons, beans, potatoes, corn, wheat.** It is a great labor-saving machine. I certainly want the sale of your weeder another season." HENRY HOGUE, Pepin, Wis.

"I tended last season 75 acres of **corn** and **potatoes** with the Success Anti-Clog Weeder, and I am in my 70th year. I must say I never before saw such clean fields of corn and potatoes in my life. With the weeder I did with one team as much work as three men and three teams could do with the old style cultivators, and did the work in a very much better manner, too." L. B. MARSH, Trempealeau, Wis.



"I used your weeder on twenty-five acres of **corn** and ten acres of **potatoes** during the past season. It was run exclusively by a thirteen-year-old boy. I find, as the result of using the weeder, that, if run in time, the weeds cannot start. Its work is highly satisfactory." W. J. ROBERTS, Columbus, Wis.

"I would not be without the Success Anti-Clog Weeder for three times what it cost me. I would like to have the agency for my county. I have used the weeder on **corn** before it was up, and after it was plowed, with great success. Just after the **corn** was planted we had some heavy rains, which packed the ground very hard. I put some weight on the weeder and it did the work very fine." MARLOW KIDD, Glen Haven, Wis.

"I like the Success Anti-Clog Weeder very much. I worked 30 acres of **corn** and 1 acre of **potatoes,** and the consequence was I had good, clean corn and potatoes, and I would not sell my weeder, if I could not get anyother one, for $25. I have seen a good many weeders, but I like yours the best of any. I think it is the best weeder made." C. E. GIBBS, Prairie du Sac, Wis.

"The Success Anti-Clog Weeder is all you recommend it to be. Five times the price would not buy mine from me if I could not get another." E. KINNEY, West Salem, Wis.

"I used the Success Anti-Clog Weeder on my **wheat** after sowing clover seed and it was worth twice its price every day I used it for that purpose. For cultivating corn and potatoes it is the best tool I ever had on my farm. My ten-year-old boy worked my corn with the weeder when corn was 2½ feet high without removing any teeth. I used the weeder in a truck garden on **corn, potatoes, beans, cabbage, tomatoes, onions, beets** and **strawberries,** and it did very fine work. It is the greatest labor-saving, money-making tool on the farm." T. J. HALFERTY, Brimfield, Ind.

Special Price on the first order from every district where we have no agency. And the agency goes with the first order if you want it.

CAUTION: This Weeder is protected by our patent No. 600,782, dated March 15, 1898. The public is notified and warned that any infringement on our flat tooth Weeder, whether manufacturing or dealing in the same will be promptly prosecuted. Agents handling our Weeders are requested to send us names of persons thus infringing on our patents.

D. Y. HALLOCK & SONS, Box 812, York, Pa.

Don't Pay Three Profits

No 3034 Buggy. Price $37.25 With Leather Quarter Top.

If you are going to pay for a carriage why not pay the least you can for the best vehicle? Get all you can in material and workmanship—pay as little as you can for handling and "extras."

You save the jobber's commission and the retailer's profit when you buy direct from the factory. You pay the cost of making with one moderate profit added. We are not agents, but manufacturers of buggies, carriages, surreys, phaetons, wagons, harness and horse accessories. Everything guaranteed. With our illustrated catalogue you can order easily and safely. If what you order does not suit, send it back and we will pay the freight both ways. First, get the catalogue. You are welcome to a copy.

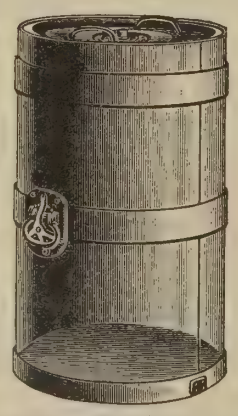
THE DAIRY "VICTOR" Churn.

This Combined Churn and Butter Worker is proving itself to be precisely what the farmers and dairymen have been seeking after. It's work is as complete as the work of the "Factory" Victor Churn, which is rapidly supplanting every other Combined Churn and Butter Worker.

IT IS THE ONLY SUCCESSFUL DAIRY COMBINED CHURN AND BUTTER WORKER ON THE MARKET.

It is easy to handle, easy to clean, perfect in its work, durable and reliable. It charm every farmer and dairyman who sees it work. Manufactured by . . .

F. B. FARGO & CO., Lake Mills, Wis.



Salt Surety

Is a good thing to have and costs little to get. It costs fifteen cents extra on every ton of butter to have a salt you can absolutely rely on. That is the first cost of using

DIAMOND CRYSTAL SALT

but, the fifteen cents comes back in fifteen different ways before you are through with it. It comes back in a saving of time, in added flavor to the butter, and weight. More—but why enumerate when the book, "The Salt that's all Salt," tells the story complete. It is yours for the asking.

DIAMOND CRYSTAL SALT CO., St. Clair, Michigan.

A Great Mystery Solved.

The reason why so much poor milk is delivered to the creamery or cheese factory is that it is allowed to be drawn in railroad, or narrow necked cans, which are absolutely impossible to keep clean.

USE NONE BUT

OPEN TOP UNION and EMPIRE STATE Factory Cans.

Which can be kept ABSOLUTELY CLEAN and PERFECTLY VENTILATED. Made of heavy tinned steel, any style top or center hoop.

Subscriptions in United States and Canada $1.00 per year; 6 months 50 cents; 3 months 25 cents.

FOREIGN SUBSCRIPTIONS may be sent through Sampson Low, Marston & Co., St Dunstan's House, Fetter Lane, London, Eng., or their agents, including the leading news dealers and book sellers in nearly all foreign countries.

All countries in the Postal Union $2 04 a year; not in the Postal Union $2.56.

Correspondents must not expect us to acknowledge the receipt of letters containing remittances for subscriptions. The receipt of the DAIRYMAN is sufficient notification that the money has been received. The label on the paper will show date to which subscription is paid. In case of renewals if date on label is not changed within two weeks after remittance is sent, inform us at once.

Remit by draft on Chicago or New York, or Post Office or Express Order; never by personal check.

ADVERTISING RATES.

Twenty-five cents per line, (agate measure) 14 lines per inch, each insertion.

Reading notices, 50 cents per line (nonpariel measure) each insertion.

THE Chicago Butter and Egg Board strongly endorses the law proposed by Congressman Davidson, taxing colored oleomargarine 10 cents a pound.

The dairy sentiment of the country, as well as all enlightened sentiment among consumers in cities, is crystallizing very rapidly in favor of this measure. The more the oleomargarine question is understood among consumers, the more revolting it appears. A few weeks since we saw a film of paraffine four inches long and as wide and thick as a case knife blade, taken from less than two ounces of oleomargarine, by one of the chemists of the New York Department of Agriculture. Paraffine will resist the action of strong acids. It is put into oleomargarine to give it body. Here is an absolutely indigestible product put into this fraud butter and yet there are thousands of foolish people declaring that it ought to have "free course, run and be glorified."

The whole fraud would be speedily taxed out of existence, if the farmers alone would stand up as they ought to and say to their congressman what they want done.

MR. PHILIP'S COWS.

The Senior Editor of the DAIRYMAN well remembers making a study of the cow Yeksa whose phenomenal record of 561 pounds of butter as a two-year-old excited much comment at the time. In many particulars of outline both of these cows resemble their mother and grandmother Yeksa. Mr. Phillips has spoken to us many times of the excellent record these two cows were making for him. They are not phenomenal cows, but they will very well satisfy the heart and judgment of a keen judge of cows, if they are measured either by form or performance.

HOARD'S DAIRYMAN has been at work for years trying to get dairy farmers to take the effort to cultivate a close, special judgment of cows. There are so few real good judges of cows. This is proved when we take a drive through the country, and see what kinds of cows satisfy the mindand judgment of the men who keep cows.

There are but few farmers who seem to show that they have the ability to breed good cows. That is proved in the same way, by looking at the cows they produce.

If any man doubts whether the cow farmers of the country need to be lifted up and broadened out into a better knowledge and judgment of cows, all he has to do is take a look at the kind of cows the farmers are contented to keep. Now these two cows of Mr. Philip's represent another order of ideas, which had to do with their breeding; another order of judgment which has had to do with their management from calfhood up; another order of ideas about feeding. All of this results in there being another order of cows, and their performance at the pail and churn shows it. The old Bible maxim, "By their fruits ye shall know them," when applied to cows, means, by what they yield at the churn; by the kind of heifers they produce, and that is the greatest of all. When applied to the farmer who keeps cows, it means another measure of judgment which may be rendered. By his cows shall ye know and measure his brains, his intelligence, his energy, in a word, the kind of dairyman he is.

LET US BE PRACTICAL.

One of the most valuable and instructive letters that has appeared in the DAIRYMAN for a long time is that of our friend and acquaintance, E. D. Tillson, of Ontario, on page 52 of last week's issue. Mr. Tillson is one of the most studious and progressive dairy farmers in Canada and is also a man of strict probity of character. His statements may be relied on as not overdrawn. We wish every reader would take especial notice of a few points that he brings out in his practice.

1. Feeding ensilage in summer. When the DAIRYMAN took up this question a few years ago and said: "The summer silo is the easiest, cheapest and most efficient way to provide succulent food for cows in summer drouths," we were met by numerous criticisms to the effect that we were not "practical."

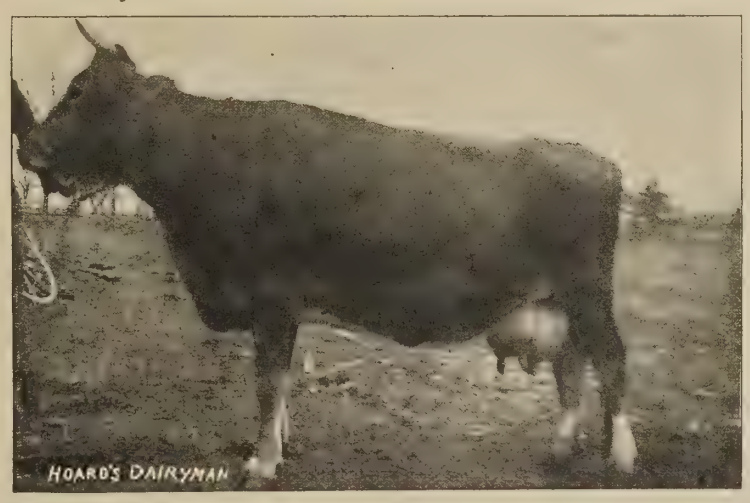
That word "practical" is a very convenient cover for lots of men to hide behind when they do not see clearly themselves. They think anything they cannot see or understand is not practical, when perhaps a neighbor right near them is demonstrating that it is profitable, and that makes it practical. Mr. Tillson is one of many representative dairymen who have built and filled silos for summer use.

2. Note that he finds his cows do a great deal better the season following if they have been kept well up to the mark and fed a little grain during the previous summer.

3. He makes especial provision for weeding out the unprofitable cows; he weighs each cow's milk once a week and tests for per cent of butter fat once a month. There is not much labor or bother in that. Besides, it gives him boundary lines whereby to judge correctly of his cows.

4. He guards his cows against the flies in summer by taking a little pains and expense in that direction. HOARD'S DAIRYMAN has been earnestly advising this for years. There is big profit in it. But because some farmers never did such a thing, and have always forced their cows to care for themselves they shake their wise heads and say, "it ain't practical". Mr. Tillson finds these things practical; so do thousands of other men.

5. Mr. Tillson has bred up his herd, carrying with him as a constant measure, the ideal in form and performance of a *dairy* cow. It is the cows that are lacking in dairy performance, not beef, that he is constantly weeding out of his herd.



That shows how important it is for every dairy farmer to establish *right ideas* about a cow in his mind if he hopes to produce cows that will bring the highest profit. Here comes in the value of being a reader of good dairy literature where right ideas are brought out, described and talked about. If a man cannot soak up good judgments from such associations he must be a dullard indeed.

What would it cost a man to visit Mr. Tillson and get all those ideas of dairy management. Yet it can be read in the DAIRYMAN, and others like it, every week in the year for the cost of ten cigars or 20 glasses of beer. Yet there are thousands of farmers who prefer the cigars and beer because they understand them better.

It is the *demonstration* of what is really *practical*, really *economical*, really *profitable*, by such men as Mr. Tillson and hundreds of others who tell their story in the DAIRYMAN, that establishes landmarks and boundary lines for us all to follow. This dairy question from the cow to her finished product is obscure and hazy in the minds of many farmers because they will not read and study to establish clear judgments on it. It is the same as if they had no boundary lines to their farm. Mr. Tillson's herd of 55 cows averaged last year 10,242 lbs. milk and 418 lbs. of butter. How did he get these? By cultivating his mind, increasing his knowledge, so that he might avoid costly mistakes. There is no other way to be practical, or secure practical results, and any man may travel it that will.

QUEEN VASHTI, A. G. C. C. 6051.
Property of A. J. PHILIPS, West Salem, Wis.

YEKSA'S QUEEN, A. G. C. C. 6631
Property of A. J. PHILIPS, West Salem, Wis.

Two Wisconsin Guernseys.

ED. HOARD'S DAIRYMAN:—I send you under separate cover, pictures of my two cows, Queen Vashti and her daughter, Yeksa's Queen. The latter is the dam of the young bull I sold to the Kansas College of Agriculture last spring, and last week I shipped her last bull calf to Geo. C. Hill & Son to do work in their fine herd. In order to show the heredity of these cows I send Yeksa's record as a two year old. She was the dam of Queen Vashti; she died in calving; her third calf was owned by Mrs. Foster, of Sparta, (Farmer's Wife, who wrote such excellent articles for HOARD'S DAIRYMAN years ago,) bought of I. J. Clapp. Her dam was Eminette, a fine cow. As a two-year-old Yeksa gave 5,330½ lbs. of milk.

Total butter for 11 months 561 pounds; largest amount of milk in one day 30 lbs.; smallest at expiration of 11 months, 14 lbs. Her average was 9½ lbs. of milk for one of butter. As a three-year-old, she made over 600 lbs. of butter in 12 months. Noticing this fine cow, and seeing her milked and tested, I was induced to buy her daughter, Queen Vashti, and it proved a good investment. She is a very gentle, handsome cow, not phenomenal, but a persistent milker for seven years. Her best record in 10½ month's milking was 482 lbs. of butter, and her smallest 342 lbs.; a total for seven years 2,518 lbs. of butter. She has given me two heifer and five bull calves, and two of the latter I now have, the youngest two weeks old, the other 11½ months. Yeksa's Queen, named by Mrs. Foster, has a larger record than her dam, but was longer making it; 599 pounds of butter in 12 months out of 9,686 lbs. of milk. Her largest month's milking was in June '97, 1,030 lbs. smallest, in January 595.

Her record for six months this season from May 29th to Nov. 29th, was 5,728 pounds; largest yield, June, 1,128 11-16; smallest, November, 687 3-16.

Queen Vashti gave, this season, from Dec. 29, '97, to July 4th, '98, 185 days, 4,149 8-16 pounds of milk; average test 5.6.

Average test, the past season, six months, of Yeksa's Queen, 5 4.

I have a two-year-old heifer from Yeksa's Queen that gave, this season, from May 29th to Dec. 1st, 128 days, 2,771 pounds; average test 5.2. This shows heredity. You will notice Yeksa's Queen has great capacity. She has never been fed to her full capacity, and has wonderful navel development. These cows have no better care than any farm cow should have. A. J. PHILIPS.

La Crosse Co., Wis.

A tired cow, a worried cow, a cold cow, an abusedcow, an ill fed cow, a cow that is uncomfortable in any way will make the owner pay for her discomfort and in the long run pay him back many times over for his neglect or abuse.

TO THE MEN WHO DON'T TAKE HOARD'S DAIRYMAN.

Mr. J. Moldenhawer, of Washington, D. C., is a highly skilled dairyman. He is engaged in producing the finest of milk for the highest paying demand. Mr. J. C. Jurgensen, of Brooklyn, N. Y., in writing to us in the issue of Sept. 23, concerning a visit he paid Mr. Moldenhawer, says:

"Mr. Moldenhawer is himself picking out Hoard's Dairyman before any other of the many farm papers he keeps, and he frankly says that your great paper is of high value to him. When a man with his reputation says so, how can the farmers who expect to make money by keeping cows for dairying, get along without the Dairyman. Still it is a very trying job to try to convince farmers how much it would help them to keep an extra good dairy paper."

What is the lesson that the above teaches? This: That no man who is keeping cows for profit can afford NOT to have such a friend and adviser as Hoard's Dairyman at his elbow every day in the year. Simply put a dollar bill in a letter with your name, post office, county and state plainly written on a piece of paper, and mail it to us, and secure the paper to Jan. 1, 1900.

THE letter in our last issue from G. H. Gurler on the "Price of Elgin Butter," was by mistake attributed to him as Chairman of the Quotation Committee. Mr. Gurler is a member of the Board of Directors instead of the Quotation Committee.

THERE is a world of suggestion and food for thinking in Mr. Geo. T. Powell's description on page 54 of the last issue, of that body of prosperous Quaker farmers at Sandy Spring, Maryland. It is a picture well worth studying. Such men and their wives and children are the true kings, queens and princes of the land. Contrast them with all they have and enjoy with some other communities that every one of our readers know of.

What has made the difference in favor of the Marylander is simply this: They let their brains have a chance to grow; they studied the principles of good farming. And of such is the kingdom of good farmers.

WHAT NEXT?

Edward Nipple was arrested and fined in Denver for selling milk below the standard. He made the plea that in the jolting of a wagon the milk at the bottom of the cans is stripped more or less of its cream.

FORM, FUNCTION AND TEMPERAMENT.

HOARD'S DAIRYMAN welcomes communications of the kind submitted by Mr. S. Burchard and printed on page 70, without regard to the circumstance that the views expressed may differ from those held by its editors. What it wants is light, more light, on all subjects connected with *"Dairying and Dairy Stock Interests"* and it knows of no way of getting this light except from the lamps of experience, statistics, and sound reason. It is not without respect for the opinions and practices of the fathers, but it also subscribes to the doctrine so pithily expressed by the late Hiram Smith, the great apostle of Wisconsin dairying, who said, (when charged with inconsistency because he advocated in his later years views contrary to those expressed previously) "if I haven't learned anything in the last ten years, I ought to have died ten years ago."

The associate editor well remembers the dairy herd referred to by Mr. Burchard, and agrees with the commendations bestowed upon it. The owner of that herd lived up to the possibilities of his day, both as to the breeding and the care of dairy cows, but the son has made some advances and is nearer the goal of the ideal dairy cow, than was the father. We expect still further advance and shall not be greatly surprised to learn that as the years go by he attaches less and less importance to "square endedness" and other beef characteristics.

We have sometimes thought that our Holstein-Friesian breeders were more nice than wise in their attempts to distinguish between the "milk form" and the "milk and beef form". We intimated as much to Mr. Carpenter, of Menominie, Mich., at the recent Wisconsin Dairymen's Convention and he promised to send us some photographs of typical animals to illustrate this distinction.

The contention of HOARD'S DAIRYMAN is that Function, acting through successive generations, determines Form. In other words, nature is always striving to work along the lines of least resistance. Every living thing, whether among plants or animals, tends to take on and transmit that form which will enable it to accomplish its mission in life without unecessary expenditure of energy. Form therefore becomes to a very great extent an index of and limitation upon Function, although not in any sense its origin or cause. This lies still further back, and for want of a better term is called Temperament, an intangible something that will sometimes overcome the limitations of form and give speed to a cart-horse and dairy ability to a beefy built cow, but, let it not be forgotten that with such a formed animal there must be an expenditure of extra energy necessary to overcome the want of harmony between the individual form and the individual function.

The statistics given do not seem to us conclusive. If we assume that all these cows were properly assigned to their respective classes, it by no means follows that the 108 cows with the higher weekly records would hold a similar rank if the yearly yields were compared; or that these higher weekly records returned a larger net profit; or that the progeny from these cows *inherited* the dairy ability found in that from the cows possessing the "milk form." In other words, the deduction is too broad when compared with the facts.

We are very sure the writer of the article here commented upon will take no exceptions, and we see no good reason why others should, to the statement that the scales of points adopted by the various associations and cattle clubs are not only exceedingly arbitrary but were based upon very inadequate knowledge of the relation of form to function, and in several particulars are too much concerned with the details which were supposed to be necessary for a conventional standard of symmetry of outline. What has become of that milking strain of Short-horns which gave character and excellence to the herd of cows to which our correspondent refers? They were outlawed and, we say it not without regret, practically exterminated by a "Scale of points" which demanded beef characteristics. Such bulls as Sylvester Burchard, Senior, put at the head of his dairy herd could win no prizes in the show ring, because they did not conform to this arbitrary scale of points for the typical Short-horn. They were set aside, despised, forsaken, killed; and the "typical", prize-winning, scale-of-points bulls were promoted to fill the vacancies thus created, with the result that very many Short-horn cows of today need the assistance of a wet nurse to keep their calves from starving.

Not very many years ago Holstein-Friesian breeders were pursuing much the same course. HOARD'S DAIRYMAN warned them of their folly and adjured them to hold fast to the dairy quality of their cattle and let dairy excellence rather than straight lines and conventional scales of points, be given the place of honor. It has been much pleased to observe that there has been a very decided change of front in this regard, both by breeders and judges, and that the Holstein-Friesian Association has been wise enough not only to recognize but to encourage dairy excellence pure and simple, without regard to peculiarities of type or strict conformity to an arbitrary scale of points, the length of face or the size of tail.

"HOLD UP OUR HANDS AND PRAISE GOD."

Mr. W L. Dexter, of Russell, Ind., who keeps a dairy of 50 cows and ships milk to Chicago, sends us a small club of subscribers and writes as follows:

"I am going to devote a little time to help you along in your good work. The fight you are making against the butterine fraud deserves the support of every man in the United States who keeps a cow. If the bill now before Congress, putting a tax of 10 cents a pound on all butter substitutes in imitation of yellow butter passes, it will stop the making of that stuff. And then we can hold up our hands and praise God."

Mr. Dexter is a practical man and a wise man. He doesn't let other men fight his battles and never say a word or do a thing to indicate that he appreciates it.

Now let every reader of the DAIRYMAN on this day of the year of our Lord, 1899, sit down and write a letter or postal card to his congressman, asking that member to support Bill H. R. 11,604. It will make a wonderful difference with the action of that member if he begins to hear from his constituents, Show him you are interested, at least two cents worth in this matter.

There is no influence in Congress like letters and postal cards from home constituents and the more of these they get the greater the influence.

Don't fail to do this good and patriotic work.

Wisconsin Dairy School, Class of 1899.

ED. HOARD'S DAIRYMAN:—One hundred and eight students were present at the last examination of the term, which closed February 16th. There have been 122 in attendance during the winter.

All of the departments of the school, milk testing, pasteurization of milk and cream, creamery butter making, and cheese making, have been more crowded than before. About two and one-half tons of cheddar cheese were made by the students, and the remainder of 5,000 lbs. of milk received daily they made into butter or pasteurized bottled cream. Nearly one-half of the students had places to work at the close of the term.

Mr. Henry Van Leeuwen, who has been instructor in milk testing during the winter, goes to the University of Missouri at Columbia for the month of March, to give instruction in dairying in their short Course.

Mr. U. S. Baer, one of our dairy school instructors in cheese making, has been engaged as cheese instructor for the ten weeks' term beginning March 13, at the Dairy school of Pullman, Washington.

Twenty-six applications for butter or cheese makers were received by us in January, and up to date, ten in February.

Madison, Wis. E. H. FARRINGTON

Breeding up a Dairy Herd.

Experience of a Canadian Dairyman.

ED. HOARD'S DAIRYMAN:—Knowing that you have always taken a great interest in good cows and have been laboring hard for these many years trying to teach us farmers the great importance and benefit in having better cows, I thought you might be interested in knowing what progress one of your people has been making over here in Canada. I have been engaged in farming more or less for forty years and have kept cows all that time, but never took any special interest in trying to breed up a herd of especially good dairy cows until I took HOARD'S DAIRYMAN, some six or eight years ago. I was led by the teachings of that good dairy paper to see the importance of knowing just what each cow in the herd was doing, whether she was paying for her board or not. As HOARD'S DAIRYMAN told just how to go to work to find out whether our cows were paying for their board or not, I took its advice and bought a pair of scales and Babcock tester and started in to find out which cows were worth keeping and which were not. I soon found out that many of my cows were running me in debt for their board, so I sent my foreman away to a breeder of first-class Holstein cattle to buy a bull. He bought for me a young, good, registered bull and four good, young, registered heifers, and I commenced breeding up and weeding out, raising all my best heifer calves and weeding out all the poorer cows that were not paying for their board, selling them for beef. I replaced them with good heifers, keeping a record of the amount of milk and butter that each cow made during the year, weighing each separately once a week and testing quality with Babcock tester once a month.

Now, I think that I have as good a herd of cows as there is in Canada, and I think you will agree with me when you look over the record that I am sending you herein enclosed. When we commenced to improve the herd by better breeding and weeding out we also adopted a better system of feeding and better care, provided better stables, with more comfortable, healthful and pleasant surroundings.

We were taught how to make all these improvements and stimulated to do them, through the reading of HOARD'S DAIRYMAN, as well as other good agricultural papers, attending lectures and conventions, etc. HOARD'S DAIRYMAN gave us the first start and stimulated a desire for other good reading matter and more agricultural knowledge. This gave me ambition and pride to keep up with the times and which led to my going to a lot of expense in building new stables, improving the old ones, building and fitting up a creamery, buying scales and Babcock tester, building piggery for keeping pigs to utilize our by-products from creamery to best advantage. So now we have got things fixed up pretty nice. It has cost some money, but it gives me great pleasure in looking over these improvements and showing our visitors over the place (we have lots of them). Just received a letter from the secretary of a Farmers' Club, saying that I am to have twenty visitors here next week, coming in on one train. So you see it gives me a good deal of pride to feel that I have something nice to show them when they come, and if the editor of HOARD'S DAIRYMAN should ever be passing through Tilsonburg and would stop over one train, I would take the greatest of pleasure in showing him through our beautiful town and over the Annandale Farm, and show him some of the outcomes from his hard and earnest teachings these many years.

Enclosed you will please find milk record giving the record of herd for two years.

Ontario. E. D. TILLSON.

The record above referred to was published last week on page 52.

It Fits All Sections of the Country.

Thirty Thousand dairymen, butter makers, cheese makers and breeders of dairy cattle read HOARD'S DAIRYMAN each week. These men are found scattered all over the continent from Nova Scotia to Mexico; from the Atlantic to the Pacific. Besides a large edition is sent to all the countries of Europe and to Australia and New Zealand.

That shows that wherever an intelligent man and a cow are found together they want HOARD'S DAIRYMAN, "for what there is 'n it for them." It shows also the humbug of that plea that dairy problems are different in different sections. HOARD'S DAIRYMAN "shines for all." Only $1.00 a year, or less than 2 cents a week.

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name, Post-office and state of writer. Condense the questions into plain specific inquiry. Be careful to note if your questions have not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

GLOSSARY.

The terms used in this department of HOARD'S DAIRYMAN have the following significance:

RATION.—The total allowance of feed for twenty-four hours.

DIGESTIBLE NUTRIENTS.—That portion of the organic matter which can be digested by the animal and does not pass off through the bowels as excrement.

PROTEIN.—That part of the digestible nutrients which goes to the formation of lean meat, ligaments, hair, horns and the casein (or curd) of milk. It is generally believed, also, that protein may be, and many times is, converted into the fat found in milk. The basis of protein is nitrogen, hence the protein elements are frequently termed the *nitrogenous* parts of the food. They are also called *albuminoids*.

CARBOHYDRATES.—That part of the digestible nutrients which is the primary source of sustaining animal heat and furnishing the power for keeping the animal mechanism in operation. They are composed of the woody fibre of the plant and grain, and the starch, sugar, gums, etc; and in the published tables of chemical analyses are usually subdivided into the terms *crude fibre*, which is the least digestible portion of feeding stuffs and *nitrogen free-extract*, so-called because it does not contain any nitrogen.

ETHER EXTRACT.—That portion of the digestible nutrients which may be dissolved out of the food stuffs by ether. It is frequently called *crude fat*. Whether fat is actually digested and thus passed on into the circulatory system in a changed form, or whether it is simply separated from the other elements and always maintains its identity is an unsettled problem. It can be used by the animal for maintaining the body temperature, and for this purpose is from 2.2 to 2.5 times more efficacious than the carbohydrates. It is maintained, by some, that the fat in the milk comes, largely, from the crude fat in the food but it has been demonstrated that it is not absolutely necessary for this purpose.

FEEDING STANDARDS FOR MILCH COWS.

Dry matter.	DIGESTIBLE NUTRIENTS		
	Protein	Carbohydrates.	Ether extract.
lbs.	lbs.	lbs.	lbs.
23 to 28	2.0 to 2.5	12. to 15.0	0.5 to 0.8

BUTTER AND BEEF BREEDS.—RICHNESS OF MILK.—PRICE OF POP CORN.

What breed of cattle would you prefer if butter making is the sole object, and what breed is preferable if butter and beef are both to be considered?

Will a cow's milk show about the same per cent of butter fat during a period of a year's milking, or is the milk richer when she is a new milker than it is after she has been milked six or eight months?

I never saw pop-corn quoted in any market report. What is an average price per bushel and what color sells best, red or white? R. B. H.

New York.

As we have frequently stated, breed is of secondary importance so long as we use a dairy type, selected, fed and bred intelligently.

Dairymen are paying more and more attention to the individual animal. It should be understood that there can be pedigree without performance and performance without pedigree. Consequently, if you find a good animal that by scales and test shows a profit to its owner, put it in your herd if you can. At the head of your herd place a bull of one of the pronounced dairy breeds; one from a strain of butter producers. It makes but little difference which one, so long as you breed and select intelligently from his get. If you like a large animal take a Holstein; if you prefer small cows, a Jersey or Guernsey will fill the bill.

The DAIRYMAN has always claimed that beef and butter could not be obtained, with profit, from the same animal. Others think differently and you had better follow their advice rather than that of the DAIRYMAN. Prof. Shaw claims that the Devon is a good representative of the dual-purpose cow.

As a rule, the milk is richer after the cow has been milked for six to eight months. The milk is poorer immediately after calving than at any other period, but there is a larger flow.

Rice pop-corn is quoted at the present time at 1½ to 1¾ cents per pound. The red corn is not quoted.

A WASHINGTON RATION.

Will you kindly give me a ration from corn meal, wheat bran, shorts and timothy hay for grade Jersey cows? C. S.

Monroe, Wash.

One cannot suggest a satisfactory ration formula from the feeds named. Where some of the by-products which contain 20% or more of protein cannot be had, the dairyman should lose no time in providing himself with clover or pea hay. One hundred pounds of timothy hay contains only 2.8 pounds digestible protein, where there are 6.8 pounds in the same quantity of clover hay and still more in pea hay. The best we can do for this inquirer under present circumstances is to advise feeding not less than 10 pounds of bran and shorts daily—more if the cows can make good use of more—and all the hay they will eat.

BUCKWHEAT MIDDLINGS FOR HORSES.

Are buckwheat middlings good for horses? How much of them dare I feed?

I am feeding buckwheat middlings, corn meal, mixed with cut carrots and beets, to my cows.

What value are the middlings with bran at $14 and corn and oats ground at $16? I am getting them at $12.

Sodus, Mich. J. E. K.

We cannot see why buckwheat middlings should not be a suitable feed for horses if mixed with bran, or better yet, with ground corn and oats, or bran. Unless mixed with something of this kind they become sticky or pasty in the mouth, and neither horses nor cows relish them. For balancing a ration otherwise deficient in protein, buckwheat middlings are worth from 50 to 75 per cent more than bran, but for purely nutritive purpose only about 5 per cent more.

SLOW CHURNING.—COW PEAS AND KAFIR CORN.

Since getting a cream separator we have had trouble in churning; the same taking frequently three times as long as when using the gravity system, and often being compelled to raise churning temperature to 70° F., while all the other conditions remain the same as formerly as far as we know; cream cans immersed in well water at 50° F. just after separation; held in frost proof room about 24 hours, then raised by immersion in hot water to about 75° F., starter added and left to ripen. Think that the open setting requires less time to afterwards ripen, and that possibly the fault lies here. Can some dairyman give farm dairy methods? Also will L. W. Lighty please give his method of sowing the cow peas and kafir corn? How prepare the ground? Does he sow the peas and then plow under 4 inches deep as for Canada peas, and sowing the corn on the surface at a later period? Please make this clear on each point, and the time for his latitude. J. B. D.

Benton Co., Ind.

Can you not give more data? How rich is your cream? What degree of ripeness? Are your cows on dry feed alone? Are the cows advanced in lactation? All these points have an effect on the ease and rapidity of churning and we must know something about the above points before we can tell where your trouble is. Cream from separator requires more time to ripen than from open setting.

A NEW YORK RATION.

Will you kindly make a balanced ration for good sized cows from the following feed stuffs: Ensilage, clover hay $6 per ton, rye and oats mixed of about equal bulk, worth about $22 per ton, bran $19, cotton seed meal $26 per ton. J M H.

Malone, N. Y.

We should not feed the rye and oats at the priced named, but use bran and cotton seed meal somewhat as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
25 lbs. silage	6.60	.33	3.50	.18
10 lbs. clover hay	8.47	.68	3.58	.17
5 lbs. bran	4.40	.63	1.93	.15
2 lbs. cotton seed meal	1.84	.74	.34	.24
Totals	21.31	2.38	9.35	.74

This formula is deficient in dry matter and digestible carbohydrates, which can be supplied with straw or some other coarse fodder, if any is to be had cheaper than clover hay. If not increase the latter up to the limit of each cow's appetite.

A PENNSYLVANIA RATION.

Please give me ration from the following feeds: Clover and timothy, (mixed) hay, $10 per ton; corn stover, $7.00 per ton; bran, 65 cents per cwt.; corn and oats chop, 90 cents per cwt.; gluten feed, 80 cents per cwt.; old process oil meal, $1.50 per cwt. For good sized, selected, common cows.

Wilmerding, Pa. R. W. T.

If these cows are fresh or nearly so, they ought to return a good profit from the following:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
15 lbs. hay	12.87	.72	5.94	.24
10 lbs. stover	5.95	.17	3.24	.07
4 lbs. bran	3.52	.50	1.54	.12
4 lbs gluten feed	3.69	.82	1.93	.12
Totals	26.03	2.21	12.65	.55

We realize that this ration costs nearly 17 cents, but a very considerable portion of this cost is returned in the value of the excrement for fertilizing purposes. The cows must be kept at all events, and if they pay a good profit on the feed, in excess of that required for mere maintenance, there is a decided gain. Fully three-fifths of the above ration would be required for their simple maintenance, and would cost in the neighborhood of 11 cents per day. If the milk brings in only 12 cents per day, there would be a clear profit of one hundred per cent in feeding as above.

COWS WERE DRIED OFF AT WRONG TIME.

Cows are in perfect health, but are not more than paying for their feed. They are very fat, and have ravenous appetites. Their calves are respectively 2½ and 5 months old. I milked them to within a week of calving, possibly that is the trouble. I am feeding equal parts of wheat bran and cotton seed meal. I mix with the meal and bran four pounds of cottod seed hulls morning and evening. Two and a half pounds meal, 2½ pounds bran, mixed with 4 pounds of hulls constitutes a meal. Will you kindly give me a well balanced ration. We have corn meal, cotton meal and hulls and bran.

Paschal, Ga. J. B. G.

We think the trouble with these cows is not so much that they were milked too long, as it is that they were dried off when so near freshening. Unless a cow can be dry fully four weeks, she better be milked continuously. That the cows are very fat is evidence that they are receiving more feed than they can economically use. Cut down on the cotton seed meal, at least, half; that is, instead of feeding 2½ pounds twice a day, feed only half as much, and if the cows continue to lay on fat, reduce the amount still more.

It is, perhaps, doubtful whether these cows will ever fully recover from the injury occasioned by forcing them dry so late. We cannot explain fully, or certainly, why such results follow, but it seems probable that there is some injury to the tissue of the glands in the udder which interferes with subsequent normal action.

A RATION FOR COWS—HAY FOR CALVES.

Would like a balanced ration for a herd of grade Guernseys weighing from 800 to 900 pounds each, from the following feeds: good early cut clover with a very little timothy in it, good ensilage quite rich with corn, bran $16 per ton, middlings $17 per ton, gluten feed $16, oil meal $30, cotton seed meal $28, oats 30 cents per bushel.

We would like this ration with as little grain as possible and have it right, as we have to buy the grain, and have the clover and ensilage in plenty.

Which is the better feed for young calves about a month old getting separator milk, timothy hay or second crop clover with a very little timothy in it and well cured, or ensilage? W. J. & C. G. M.

Morton Corners, N. Y.

We suggest as follows for the cows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
30 lbs. silage	7.92	.39	4.20	.21
10 lbs hay	8.47	.68	3.58	.17
4 lbs bran	3.52	.50	1.54	.12
4 lbs. gluten feed	3.69	82	1.93	.12
Totals	23.60	2.39	11.25	.62

If the cows will eat it the hay may be increased to 12 or even 14 lbs. per day and the bran reduced at the rate of 1 lb. for 2 lbs. Feed the grain with the silage.

Good second crop clover, if cut before it passed out of blossom is better for the calves than timothy. They will not eat very much at first but should be supplied with fresh hay at least twice daily.

TAMWORTH HOGS.

In yours of January 20th inst, I notice what J. A. McDonald says about Tamworth hogs? I want to know more about those hogs, and who has them to sell nearer than the advertisers you have from Canada.

Where does J. A. Mc Donald live, and has he those hogs for sale?

Freeborn Co., Minn. F. W. BARLOW.

You will find Mr. McDonald's ad. in the DAIRYMAN.

BLATCHFORD CALF MEAL.

Do you know anything about Blatchford's calf meal? It sells for $3 per 100. Could not a man mix just as good a calf food for less money? Please give me a ration from the following feeds: corn stover and timothy and clover hay (I put timothy first, as the hay is only about one-fourth clover), for coarse feed, and rye feed at $14 per ton, and gluten feed at $18. The rye feed is all of the rye that is left from the flour (bran and middlings). G. R. S.

Ballston Lake, N. Y.

Blatchford calf meal is a most excellent combination for growth and health of calves, and is used quite extensively by dairymen and breeders. Others get along with home-made mixtures which probably cost less, but are probably not just as good. The proper plan for this inquirer is to get some of the meal and try it for himself.

For the cows, if near full flow of milk, we suggest a daily allowance of, say, 4 pounds rye feed, with 5 pounds gluten feed, 12 to 15 pounds hay, and all the stover they will eat.

SILAGE FOR SUMMER DROUTH.

Being an interested reader of the DAIRYMAN and a dairyman myself, in a small way, I would like a little information about ensilage. I have a silo 14×28×27 feet deep, divided in the center, that we have filled three years with corn, with excellent results.

Is there any spring crop that could be profitably used to put in the silo, to tide over the dry weather and shortness of pasture that we nearly always have here in central New Jersey, from the middle of July until the corn is ready to put in? Peas and oats will grow here, but not so good as farther north. We also raise good crops of red clover. The crimson clover has not been a success here.

Locktown, N. J. C. R.

Common red clover makes excellent silage. Or you can put up enough corn silage the year before to last through the winter and carry some over to meet the exigencies of the summer drouth.

A NEW YORK RATION.

Will you please give me a formula for balanced ration (for milking cows) of ensilage, hay, timothy and clover, wheat bran, and linseed or cotton seed meal?

Would it be advisable to feed milk cows corn meal even where one raises it on the farm? W. D. B.

Ricard, N. Y.

The advisability of feeding some corn with other grain will depend somewhat upon its relative market value. For example, we submit the following:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
25 lbs. silage	6.60	.33	3.50	.18
12 lbs. mixed hay	10.30	.58	4.75	.19
6 lbs. bran	5.29	.75	2.32	.18
2 lbs. cotton seed meal	1.84	.74	.34	.24
Totals	24.03	2 40	10.91	.79

This gives at least a full supply of protein, and if ground corn costs less than bran, we would take out, say, 2 lbs. of the latter and let 2 lbs. of corn take its place.

A NEW YORK RATION.

Would you kindly formulate a ration of the following. I want to get as large a flow of milk as possible: Wheat bran, $17; rye feed, $14; corn meal, 18; gluten feed, 18; clover mixed hay, $5. M. L.

Wemple, N. Y.

We have no conception as to what this so-called "rye-feed" may be. If it is rye bran and middlings, it is probably cheaper at $14 than wheat bran at $17; but if it is a conglomerate mixture of a little of everything, we would advise letting it alone. We therefore submit a formula, selecting the feeds that are well known and have a fairly uniform and ascertainable quality, as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
20 lbs. mixed hay	17.16	.96	7.92	.32
4 lbs bran	3.52	.50	1.54	.12
4 lbs gluten feed	3.69	.82	1.94	.12
Totals	24.37	2.28	11.40	.56

We consider this about the least that a cow in fairly good flow of milk should receive, and there are cows that could profitably be fed quite a good deal more. The only way to determine just how much to feed is to watch the results and the way the cow applies what is not required for maintenance. If she takes on superfluous body fat, we may be sure she is receiving more grain than she can profitably use for milk making.

FEEDING HEIFERS—REMOVING WARTS.

We have some 15 heifers that we are feeding on sorghum cane, and they have a straw stack to go to at all times, but they are not doing as well as they ought to. They have not come in heat to breed, and I think that is a sign they are not feeling well. What can I feed them in the way of roughage that would balance their feed some? Would alfalfa hay be sufficient, or would peas and kafir corn be better sowed together?

I have a heifer that has a wart on the shoulder about the size of the end of your thumb, or one-half inch high and an inch across; rough and dark looking. What must I do to take it off? W. H. B.

Concordia, Mo.

At least half of the fodder for these heifers should be alfalfa hay, or something of that kind. Kafir corn and pea hay would be good, but not better. A little grain each day would help to bring these animals into condition.

For removing warts, consult the index and back numbers.

AN ICE-CREAM QUESTION.

Please tell me how to make good ice cream that will stand up. We want to add ice-cream to our trade, but the kind we make melts too quickly. B. J. C.

Willink, N. Y.

This is out of our line. Will some correspondent please answer the above?

PREPARING A HEIFER FOR HER FIRST CALF.

I have a three-fourths Jersey heifer, a little over two years old, who will have her first calf about May. What treatment should I give her, and what food is best for her now; also after she has had her calf? Our market affords corn meal, cotton seed meal and wheat bran and chops. For roughage we have shucks, common grass hay and cotton seed hulls, with occasionally some dried field peas in the shell. Kindly make me a ration. I am advised to go through the process of milking her from now on, to stretch her bag so she will give more milk, and to prevent caking, etc. What would you advise? E. H. C.

Albany, Ga.

For the present give this heifer a mixture, equal parts by weight, of ground corn (chops) and bran, and from 2 to 4 pounds per day. Increase the amount in April to about six pounds. Give her in addition, all the hay and "shucks" she cares to eat. Do no milking unless absolutely necessary to reduce inflammation. We want the udder to swell to its utmost,—the more the better, if it does not become hot, feverish and tender, which it is not likely to do. If a few days before she is due to calve the bowels are not in first-class condition, give laxative doses of Epsom salts, but not so much as to operate as a physic. A quarter of a pound will probably suffice, and may be repeated the second or third day if necessary.

After the calf appears, feed very light for three or four days, and entirely of bran for grain, then increase gradually, adding a little corn chop and less cotton seed meal. Watch appetite and other symptoms, and if everything moves on favorably, at the close of the first month, she may be receiving from 4 to 6 pounds of bran, 2 pounds chop and 1 pound, or possibly 2 pounds cotton seed meal daily.

MARKET FOR CONDENSED MILK.

I am thinking of building a condensing factory. Can you tell me where I can dispose of two or three cars of milk a week either plain or sugar condensed? What is the average price of same?

WM. PETERSON.

We should advise you to correspond with some of the wholesale grocers in Chicago. They can furnish you with data that the DAIRYMAN would be unable to give.

Peas and Oats.—A Cow Pea Inquiry.

ED. HOARD'S DAIRYMAN:—I saw L. W. Lighty's article, on page 8, of the Feb. 17th issue. I became greatly interested because it corroborated my ideas in regard to the growing of peas and oats for hay, in so dry and warm a climate as exists in Southwestern Michigan and Pennsylvania. I have followed the DAIRYMAN'S plan of seeding, *i. e.* plowing the peas under 4 inches, and then drilling the oats on the top; still I have not had very good success for the reasons stated by Mr. Lightly—too dry and hot about the time the peas come into bloom, and in case of the smaller Canada field pea, the vines will shrink and seem to almost disappear.

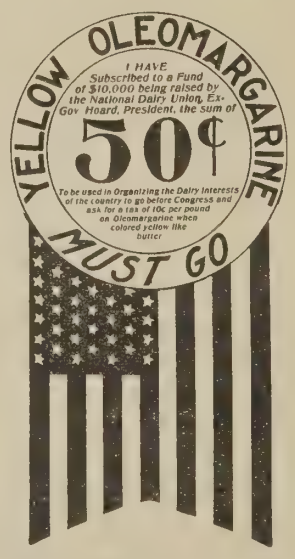
I have been trying to find the analysis of pea hay and oat hay and determine from it if the oat hay would not do without the peas. I ask your help, as I have been unable to find such analysis. I have nothing but a little experimental knowledge to guide me. As far as that goes, which is not far, I have had very good results from the feeding of the oat hay alone, and from close observation of the churnings could not tell any difference when pea and oat hay were fed, or oat hay alone. However, the peas sown with the oats has left the soil in much the better shape. I should continue to sow them, although the seed costs us here from 90 cents to $1.25 per bushel, if Mr. Lighty's article had not appeared.

Now I am anxious to try some cow peas, and I ask Mr. Lighty to be kind enough to name the best two varieties for hay and silage for use in Southwestern Michigan. I have got a 15-acre field that has just been relieved of an old peach orchard, which needs lots of nitrogen, and I believe that the cow pea will help to put it there, and help furnish some cow feed for the dairy also.

Mich. GARDNER AVERY.

Following is the analysis asked for:

	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
Cow pea hay	79.7	9 3	38.4	1 2
Oat hay	84.9	4 3	46.4	1.5



The cow pea hay contains about twice the digestible protein of the oat hay, and is a more valuable feed in consequence.

NATIONAL DAIRY UNION BADGES.

Secretary Knight, of the National Dairy Union, has gotten up a beautiful and suggestive badge for all those who desire to enroll themselves in the ranks of opposition to the oleomargarine fraud. The badges range in price from $10 to $5, $1 and 50 cents.

Below, we give an illustration of the design of two of the series. It will be seen that in general outline the badges are alike, the only difference being in the sum named on the face.

The object in selling these badges is to assist in raising a fund for the National Dairy Union of $10,000, which will be used in a

Faith in Hood's

The Great Cures by Hood's Sarsaparilla Are Indeed Marvelous.

"My husband suffered with stomach trouble so bad at times he could not work. He has taken Hood's Sarsaparilla and it is helping him wonderfully. He also had a scrofulous humor but Hood's Sarsaparilla cured this and he has had no trouble with it since. My little boy, too, has been taking Hood's Sarsaparilla and it has given him a good appetite. We have great faith in Hood's Sarsaparilla." MRS. J. H. EDWARDS, 50 Edinburg St., Rochester, New York. Be sure to get Hood's because

Hood's Sarsaparilla

Is the best—in fact the One True Blood Purifier. Sold by all druggists. $1; six for $5.

Hood's Pills are the best after-dinner pills, aid digestion. 25c.

Artichokes! MAMMOTH WHITE FRENCH. A sure preventive of **Hog Cholera.** Enormous yield and the greatest root fattener for hogs, sheep, colts and cattle known. Write for circular. W. F. MANLEY, Richmond, Ind.

SEED DUE BILL FREE

To get new customers to test my seeds I will mail my handsome **catalogue for 1899,** lithographed and beautifully illustrated, and a **10c. Due Bill,** good for 10c. worth of seeds for trial, **absolutely free.** It is full of bargains. All the **Best Seeds, Bulbs, Plants, Roses, new Fruits, Farm Seeds, Potatoes, etc.,** at lowest prices. **Ten Great Novelties** offered without names. I will pay **$50, FOR A NAME** for each. Don't buy your stock until you see this new catalogue. Several varieties shown in colors. Great inducements for orders this year. **You will be surprised** at my bargain offers. Send your address on Postal to-day. Tell your friends to send too. Old customers will receive a copy.
F. B. MILLS, Seedsman, Box 111, Rose Hill, N. Y

INVESTMENTS.

The Linden Lawn Farming Co. will sell a limited amount of stock at par ($100.00 per share) for the purpose of extending and improving the cattle and poultry department. Every laborer invests 25 per cent of his wages in the Company. Receipts from the dairy alone in 1898, above $300 per month. Send for leaflet showing annual statement and our co-operative plan,
LINDEN LAWN FARMING CO.,
Lock Box 354, Olney, Ill

ECLIPSE Cream Separators

SUPERIORITY over any other make **GUARANTEED;** they are **CLOSEST SKIMMERS** and Built **DOUBLE AS STRONG as any other make;** also easiest to wash and operate. See and try one before buying. Ten sizes. Prices $30 to $600. Reliable Ag'ts wanted. Catalogue FREE.
C. L. Chapman Separator W'ks, ERIE, PA.

When writing mention HOARD'S DAIRYMAN.

CHERRY'S Feed and Litter CARRIER

An invention for cleaning out barns and feeding stock. The most practical device of the present day. Send for circulars to **D. B. CHERRY & CO., Knoxville, Marion Co., Iowa.**

THE MILK MAN wants an Aerator, but he wants something more, he wants a cooler as well—aeration improves the flavor, but doesn't add to the keeping qualities of milk—it's the cooling that does that. The CHAMPION Milk Cooler and Aerator does both; it's cheap, too. Get our book "Milk."

CHAMPION MILK COOLER CO.,
67 Main Street, - - CORTLAND, N. Y.

legitimate manner in arousing sentiment in favor of the passage of the law now before Congress to tax colored oleomargarine 10 cents a pound.

Every reader of the DAIRYMAN is truly interested in fencing up the gigantic fraud and swindle, both for the protection of the consumer, as well as the producer of honest butter. Make your choice friends which badge you will have, but don't fail to send to the DAIRYMAN for one or the other, and thus help the cause along.

The National Dairy Union is fighting a foe with millions of capital at its back, but we will win if the dairy farmers of the land will give us their moral, political and financial support. Bidges will be sent postage free on receipt of money.

Some Butter Questions.

ED. HOARD'S DAIRYMAN:—Some little time ago, may be in December or early January, some correspondent—a woman—was talking about certain faults in her neighbors' butter making; she stated that at a tempera ture of some 62° F., or between that and 67° F., it was not possible to get all the butter fat. The man declared that her article was not of value because while she told us that certain results were not satisfactory, the right way and the right temperature for proper churning and proper collection of all the butter fats, were not set forth. Now, if that woman sees this, will she not kindly enlighten us on these points? Let her read her article over and tell us in a positive way how to right these wrong ways, instead of simply telling us they are wrong. We have always thought that along in the sixties was the right temperature for churning, and I notice right in a DAIRYMAN before me, that another writer says, apropos of the same subject, proper temperature for churning, (this latter authority being W. C. Rockwood, Mich., Dec. 9th issue of the DAIRYMAN): "If it (the cream) is below 60 degrees Fahrenheit, the cream should be warmed, for life is too short to spend unnecessary time in doing such monotonous work as turning the crank of a churn. Cream from Jersey cows will come hard at 66 degrees Fahrenheit, and if the cream has been properly ripened, there will be no loss of butter fat in churning at that temperature." Then after saying some other very good and helpful things right to the point, things that every dairyman wants to know, the writer adds as a finale: "The one important feature aside from cleanliness, to be observed in butter making, from first to last, is expressed in the one word, temperature. That tells the whole story from A to Z. It is temperature that decides the question of butter fat extracted from the milk, temperature which ripens the cream properly, temperature which brings the butter within a reasonable length of time and ensures its being in a good condition when it comes; temperature which governs the proper washing of the granules and incorporation of salt, and finally it is temperature which preserves its quality until it is consumed."

That is exactly my idea, but when "doctors disagree" about the temperature what are we to do and how are we to know just what it should be? The first article I mentioned was written in exact contradiction of the theory always held that somewhere in the sixties is the right temperature for churning, and even raising the temperature above that which the thermometer states as correct, in winter time seems to be sometimes almost necessary, and if what Mr. Rockwood says is true, we are safe to do this. "If the cream is ripened properly, there will be no loss of butter fat." Will not someone write us an article just upon this one subject of temperature, tell us just exactly the correct temperature for all the different processes from the time the milk is taken from the cow until the butter is made and finally consumed. Tell us just how to ripen the cream, tell us just how to heat it properly for churning, tell us just how to make the butter gather properly, if it bothers by not gathering and not separating from the buttermilk, tell us how warm to make the brine which we add to the mass to bring about the separation of the butter from the milk. Tell us how strong to make the aforesaid brine, tell us at what temperature butter keeps best and longest intact. There is material for a very good and helpful article on this one subject of temperature. Who will write it? I hope someone who knows absolutely and not one who guesses, someone who will state as an absolute fact and not as a mere "think so."

Now another question is this:—and I find it is by the same W. C. Rockwood and in the same article from which I have been quoting, he says: "It is difficult to convince the average butter maker (which of course is the farmer's wife) that once working butter is sufficient. They think because they have always re-worked it that that is the only way to do, yet this second working is not only unnecessary, but it is an actual injury to the quality of the butter, especially in cold weather, when the butter becomes so hard within a short time after removing it from the churn. A good many women complain of weak wrists, and tell how hard it is to 'work over butter,' but you cannot persuade them to give up that second working. They admit that nothing is gained by it except that a little more brine is expelled, yet they persist in doing it, although in getting it in a condition, where the second working is possible, the butter bowl is set so close to the stove that the butter melts on one side while still hard on the other," etc., etc.

I am one who still clings to the idea that butter needs a second working. Now it may be if the butter, the brine and everything is just right when the butter is taken from the churn that it can be manipulated so that it will be just as good as it can be without the second working. I was surprised in reading an article in one of our papers of the Northwest, written by an editor who had visited many creameries just for the purpose of finding out what is considered perfect butter, perfect machinery and all the other details of perfect buttermaking. In summing up he was very much surprised at the percentage of water which was considered the proper thing in butter. I shall have to be as indefinite as some others whose indefiniteness I deplore, but the quantity of water that could be worked into the butter, and made to stay there, and still have the butter good seemed to him to be one of the chief requisites of the butter maker. He said some very good and pertinent things which I cannot quote. But will some one who knows tell us what is the correct amount of water or brine which should be lett in the butter? Does the butter buyer prefer butter with plenty of brine or water in it? It certainly would be more profitable to sell butter that way, for water weighs more than butter fat, and every ounce of weight counts in the long run, and when butter is made in quantities, it must count to a considerable degree.

I have seen butter at the stores when it would be taken out of the jars or tubs in which it was packed, just running with water wherever the ladle was entered. It was surprising to see how much, how very much water or brine the butter could hold, and had the weather been colder, it would not have exuded quite so freely. I think that butter was not worked the second time, and if it had been, could it have been injured by that working?

I wonder too if women are so careless in making butter as to put the butter bowl by the fire until "one side is melted and the other hard as a rock", as our correspondent testifies. Maybe some of them are but, well, maybe some of them are not, who knows? I have always rather carried the idea that as far as cleanliness, and details went in butter making, the women butter makers were nearly—yes very nearly—as particular as the men butter makers; maybe I am mistaken, for it is a man who makes the butter here.

Will someone tell us whether it is better to use brine for salting butter, or the dry salt, and if the former, will he or she tell us how much salt to how much water, and the quality of both to a pound or even to ten pounds of butter? Is the idea, that where brine is used the salt is already dissolved, and the butter can be taken care of without the second working? It has always seemed that the water or brine can be worked out better after the butter stands awhile. I am open to conviction, and I want to learn exactly the right way, but how few, even of those who write to instruct us, are exact in all the little points and details.

Don't think for a minute that I am criticising Mr. Rockwood, if that person is a Mr., and if not a Mrs. or Miss, not at all. I think the article, to which I have referred, fine, and as near exact as we often find them.

Will he not tell us just how to handle butter so that it will not need the second working? For you see women cling close to this old superstition.

Butter can be brought into a shape to be worked without overheating it on one side, that seems as though it would be absolutely disastrous to the entire product. Melted butter is not a desirable thing save as a sauce for fish or certain things, and—to work,—well I don't wonder folks say the second working is an injury instead of a benefit if the *modus operandi* is as described.

Butter is generally very pliable when taken from the churn and it would be easy to injure the grain by much working at that time, I think, and it does seem as though by letting it stand a little, the salt or brine permeates the whole mass better. There is no chance for streakiness when butter is properly worked the second time, there is less water to sell surely, but twenty cents a pound more or less is a good price for water, and although it is a scarce article here we could afford to let it go at that price.

Don't criticise me—unless you want to—I am looking for instruction, and what I have said that does not coincide with professional ideas in butter making, put down to lack of knowledge. ROSE SEELEY MILLER

S D.

Milk Your Cows Clean.

ED. HOARD'S DAIRYMAN:—It is a well known fact that cows not milked clean will tend to dry up in short order. Another important reason for milking clean is to get all of the butter fat, which is contained in a much larger per cent in the last than in the first milk drawn as is shown by the following experiment:

The College dairy has conducted an experiment showing the importance of clean milking. Five cows that were giving a fair quantity of milk were selected, and their milk collected in half-pint bottles, each teat contributing its share to every bottle. These samples were tested with the Babcock test, with the following results:

Cow No. 6 varied from .6 of 1 per cent to 7.2 per cent. Cow No. 10 varied from .2 of 1 per cent to 6.6 per cent. Cow No. 14 varied from 1.6 per cent to 5 8 per cent. Cow No. 15 varied from 1.5 per cent to 6 8 per cent. Cow No. 20 varied from .8 of 1 per cent to 7.8 per cent.

The results show a gradual, although not entirely uniform, increase in the per cent of fat from the beginning to the last of the milking, except with the last two samples drawn from each cow. Here the per cent of fat would take a sudden leap, amounting often to a third or a half of the total variation. This shows very clearly how important it is to get all the milk. By averaging the results it was found that the last quarter of a pint was worth from three-fourths to one and a half pints of milk first drawn from the udder.

Moral: Milk clean and get fat.

Kansas Exp. Station. D. H. OTIS.

IS THIS YOUR STORY?

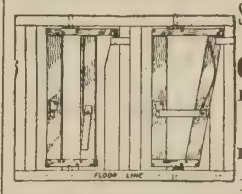
"Every morning I have a bad taste in my mouth; my tongue is coated; my head aches and I often feel dizzy. I have no appetite for breakfast and what food I eat distresses me. I have a heavy feeling in my stomach. I am getting so weak that sometimes I tremble and my nerves are all unstrung. I am getting pale and thin. I am as tired in the morning as at night."

What does your doctor say?

"You are suffering from impure blood."

What is his remedy?

Ayer's Sarsaparilla



You must not have constipated bowels if you expect the Sarsaparilla to do its best work. But Ayer's Pills cure constipation.

We have a book on Paleness and Weakness which you may have for the asking.

Some of the Many Advantages of the Dairy Cow.

ED HOARD'S DAIRYMAN:—Having worked myself out of the woods and out of a swamp with a few cows, I know they will pay, and as the dual-purpose men and beef men say dairying does not pay with their stock, let us see why the dairy cow does pay.

First, in the assurance that her calves will make good cows, (and this will appear in its due prominence when we estimate the loss in raising a poor cow) while from other stock it is at least doubtful. I referred in my last to getting heifers in dairy form of good quality from a good sire, but how much better from dam of same qualities. A poor man must do his best with what he has.

A much greater advantage is found in the quantity and quality of the milk. The dairy cow may be expected to give a fair quantity of from four to five per cent milk instead of three to four per cent milk, and to give it nearly the year around, instead of from six to eight months. The Babcock test alone, shows the quality of each cow's milk. Few persons seem to know that the cow determines the quality of the milk, hence the discontent among creamery patrons.

To give satisfaction to the general-purpose men the proprietor needs two kinds of testers. Again, few properly estimate the value of constant returns. The cow gives milk twice a day, and a little difference in value each time counts during the yearly yield of the real dairy cow. But we are met with the objection that the little old cow does not make much beef, but as she has paid for herself each year for ten or twelve years we dispose of her the best we can and are satisfied, and the calves get very fat on plenty of good milk and the men are so glad to get them that we have just sold one at three months old that weighed 140 lbs.

And now Mr. Editor allow me to say that I am satisfied that if there were many more readers of the DAIRYMAN there would be fewer complainers, and many more real dairy cows and many more happy, prosperous dairymen. I told a man yesterday that if he would take your paper and read it and was dissatisfied I would pay the dollar for him, so well am I assured that he would see the worth of it. In the future I may say how we feed and take care of the cows as we ship cream on train to creamery.

Carroll Co., Ohio. N. E. KIMBALL.

Manure—Corn—Swine Raising—Feeding Calves.

ED. HOARD'S DAIRYMAN:—All good things come to an end. My vacation is one of the good things and came to an end on March 1st. We are now looking after the comfort of sixty Jersey cows and heifers.

While we were taking our vacation we were not altogether idle, our far m foreman Nathan, was busy drawing manure from our town and with the aid of a No. 3, Kemp manure spreader, has given a field of young clover a fine dressing. He used two wagons and one team. In this way he took out four large loads daily. The wagon boxes were 14 feet long and 3 feet high. Our herd and poultry managers att ended school and looked after the comforts of some Jersey heifers we brought from Tennessee last fall; while your scribe attended two state dairy conventions, a farmers' institute and *writ* a book which we have named The Dairyman's Hand Book.

Now I will say to the readers of the DAIRYMAN that our book has the merit of only containing what we know, therefore is necessarily very scarce of pages. We did think of writing of what we did not know but on consulting our printers we found that to issue such a book would necessitate waiting for warm weather so that the work could be handled out-of doors where room was no object. If any one wishes this valuable work to add to their collection the price will be a stamp to cover packing and mailing (no charges for drayage).

Thanks for the information I have received regarding gasoline engines through the DAIRYMAN. We have given up the idea of making one engine do the work of our farm. We will put in an engine and boiler in creamery room and use a gasoline engine at barn. We will be pleased to hear from any one who has a four-horse engine and six-horse boiler in good condition, that they wish to dispose of for any cause, or any size near this will be considered.

Our county held its Annual Farmers' Institute last week and we had a very profitable meeting. Several papers of value were read. The paper on corn culture was of especial merit and was written by P. R. Sperry of Eleanor, Ill. Mr. Sperry has won many premiums on his corn at county and at state fairs; it is one of his specialties.

To illustrate his talk he had two ears of corn that measured practically alike and looked alike. On putting them on the scales one weighed 1 lb, 2 oz. and the other 1 lb. The difference was in depth of grains, one was 5/8 in. long and the other 1/2 in. long.

He recommended fall plowing and old clover sod as best for large yield. Has a special check row chain with dropper knots thirty inches apart in rows and rows 3'6" wide. Plants corn not over two inches deep.

Recommends four plowings or cultivatings; cautions farmers not to plant corn of 1898 raising in northern Illinois. Says it will not make a stand (tested new corn and corn raised in 1897; result, no germination in 1898 crop while 1897 crop all grew).

Buff Jersey spoke of the special-purpose dairy cow and was promptly called down.

The paper on swine raising by Geo. T. Pierce, of Monmouth, was an able paper. It treated on foods and care. He emphasized feeding the brood sow for growth and milk production; cautioned the farmer against feeding too much corn; told how to make a brooder for young pigs in cold weather. He uses a barrel, in it he puts a large jug of hot water and packs straw around it nearly or quite covering it up, then puts pigs in barrel and covers it up with a loose blanket.

A paper on steer feeding by R. G. Ranny of Little York just hit the masses of farmers. They could sit and listen to feeding 35c corn to steers and hogs regardless of what these finished animals would bring in market, and by their silence give approval. I would very much like to have some one give me the figures showing what profit there is in a steer put in feed lot that cost $25 when a yearling and weighed 650 or 750 lbs., and what profit is there in a $3.50 per cwt. hog fed on corn at above price.

Farmers may combine and order together. Fifteen tons the least that can be shipped. Special Freight by Car Ferry to Milwaukee of 5 cents per 100 lbs. Cash must accompany order.

MICHIGAN & OHIO PLASTER CO.,

401 Pythian Temple. Grand Rapids, Michigan.

WHAT HOARD'S DAIRYMAN TAUGHT HIM.

Mr. George V. Saffarroius, owner of the "Marion Farm", at Palmyra, Mo., writes:

"At another time I will add my testimony as to how HOARD'S DAIRYMAN showed me the way to make cows pay.

I am a "firm believer in the "Wisconsin heresy". I bought a two-year-old heifer, last fall, at the St. Louis Fair, on form alone for $75. She was put in the milk and butter test and won it. I sold her to Dr. Still, of this state, for $300, and she made 24 pounds 3½ ounces butter in seven days.

I do not write this necessarily for publication, but to encourage you in the good work. My greatest benefit derived from the paper has been from the balanced rations.

The heifer above mentioned is Rysi St. Helier."

Ripening Cream.

ED. HOARD'S DAIRYMAN:—I would say in reply to inquiry on above subject, in DAIRYMAN for February 3rd, that we churn twice a week, about fifty pounds at a time. After the cream is removed with separator, it is cooled down to about 45° F., then put in a large can and kept in a moderately cool place. As each addition of cream is made, all is thoroughly stirred in the can.

The day before churning, the cream is heated to 80° F , by placing can in a vessel of hot water, and stirring until the desired point is reached; then if the weather is very cold it remains near a fire until the next morning, when it is churned. Churn when slightly acid at about 60° F., and only a short time is required for the purpose.

Have no trouble with the cream, churning, or the butter, when following this method. The milk is from Jersey cows, mostly fresh, and the butter brings best market prices.

Franklin Co., Vt. E. R. TOWLE.

A War Against Milk Preservatives.

A vigorous war is being prosecuted in Kansas City against what is called "embalmed milk" which is simply doing by milk what General Miles charged the meat contractors had done by meat used by the army.

Speaking of the use of formaldehyde, City Physician Coffin said: "It is a deadly poison and placed in the hands of an ignorant milk dealer or dairyman is a constant menace to life. The directions on the packages sold are supposed to tell him how much to use, but what is to prevent one of these men from carelessness, indifference or possibly, when under the influence of liquor, doubling that amonnt and poisoning a score or more of his customers. Formaldehyde is very useful for some purposes, and one of those purposes is to make the pickle in which dead bodies are kept at medical colleges. No punishment is too severe for the man who puts it into an article of food or drink.

Our Special Elgin Letter.

ED. HOARD'S DAIRYMAN:—The offering of butter on Monday's Elgin Board of Trade, aggregated 7,020 pounds. Bidding opened at 20 cents, and all sales made were at that figure. On call 3,000 pounds were sold and 1,920 pounds on the floor at the same price. The Quotation Committee announced the market firm at 20 cents. The sales reported were:

Factory.	*Pounds.*	*Price.*
Big Foot	3,000	20 cts.
Shattock's Grove	1,920	20 cts.
Total	4,920	

The sales for the corresponding week of the three preceding years were as follows:

March 7, '98, 6,480 lbs. of butter sold at 19¼ cts.
March 8, '97, 24,420 lbs. of butter sold at 18 cts.
March 9, '96, 36,420 lbs. of butter sold at 21 cts.

The New York market was reported steady at 20 cents. H. C. B

Elgin, Ill., March 9, '99.

DAIRY MARKETS.

ELGIN, Ill., March 6—Butter—Firm, at 20c; offerings 117 tubs; sales, 82 tubs.

CHICAGO, Ill., March 6—Butter—Creamery, extra, 19@19½c; firsts, creamery, 17@18c; seconds, 14@15c; dairies, selections, 17c; No. 1, 15@16c; No. 2, 15c; extra ladles, 14c.

Cheese—Full cream, Twins, good to choice, 10@10¼c; Cheddars, 9¾@10¼c; Young America, 10@10½c; Swiss, 10@12c; Limburger, 8@10¼c; Brick, 8½@10½c.

Eggs—At mark, cases included, sold at 18@20c per dozen.

Cattle—The beef cattle market was generally 10c higher. The quality was poor and the demand quite good. The best cattle were not fancy. Beeves sold at 3.80@5.90, largely at 4 65@5.35. About 1,200 Texas cattle sold at 3.75@4 50. The market for native butcher stock was active and strong. Stockers and feeders ruled about steady. Estimated receipts for Tuesday, about 3,000 cattle 30,000 hogs and 15,000 sheep

Bran—Quotable at 12.50@13 per ton.

MILWAUKEE, Wis., March 6—Butter—Creamery, fancy prints, per pound, 19½@20c; extras, 19@19½c; firsts, 18@18½c; seconds, 16@16½c; imitations, 15@16c. Dairy, selections, per pound, 15@16c; lines, 13@15c. Roll, fair to choice fresh, 11@13c. Market lower under fair offerings and a quiet trade.

Cheese—American full cream, October Twins, 10½@11c; Brick, October choice, 10@10½c: winter made, per pound, 9@9½c; Limburger, fall choice, per pound, 9½@10c; winter made, 9c; Swiss, drum, choice, 12½@13c; block, choice, 10 @10½c, Market unchanged and fall goods in fair request, while winter goods are more or less neglected.

Eggs—Fresh, per dozen, 17@17½c. Market steadier, owing to the colder weather and smaller receipts

NEW YORK, March 6—Butter—Active; best western creamery, 20@20½c.

Cheese—Very firm; state, full cream, large white and colored fancy 11½c; small, 12@12¼c.

Eggs—In good demand and receipts small; prices lower, however, at 23½@24c for southwestern.

BALTIMORE, Md., March 6—Butter—Market quiet; creamery separator, extra, 22@23c; creamery separator, extra first, 20@21c; creamery first, 19@20c; ladle, extra, 16@17c; western store-packed 13@14c.

Eggs—Market easy; strictly fresh stock, 23@24c

PHILADELPHIA, Pa., March 6—Butter—Solid-packed; separator creamery, extra, 20c; firsts, 19c; seconds, 18c; imitation creamery, extras, 17c; firsts, 16c; seconds, 14c; ladle packed extras, 15c; firsts, 14c; seconds, 13c; print butter, creamery, extra, 21c; firsts, 20c; seconds, 18c

Eggs—Pennsylvania and near by, 20c; western, 20c; south-western, 20c; southern, 19c.

KANSAS CITY, Mo., Mar. 6—Butter—Unchanged; country active; creamery 14@19c; dairy 15c.

Eggs—Declined 1c: receipts increased; fresh candled Kansas stock, 14½c.

BOSTON, Mass., Mar. 6—Butter—Creamery, extra 21½@22c; western extra 21@21½c; dairy, extra, 18@19c; imitation creamery, 15@16c; western ladle 14c; print creamery, 22@22½c; box creamery, 22@22½c.

Eggs—Fancy near by, 30@32c; choice fresh, 28c; Michigan, extra, 28c; western, 26@27c; fair to good 25@26c.

ST. LOUIS, Mo., Mar. 6—Butter—Firm; creamery 19@23c; dairy, 14@17c.

Eggs—Higher, 17½c.

DETROIT, Mich., Mar. 6—Butter—Elgin extras slow, 22c; fancy dairy, 16c.

Eggs—Easy, 17c.

Cheese—11½c.

NEWARK, N. J., Mar. 6—Butter Market steady; 20c for best Elgins with fair receipts.

NEW ORLEANS, La., Mar. 6—Butter—Market steady, fair demand, 22c.

PITTSBURG, Pa., Mar. 6—Butter—Steady. Creamery 20@22c; choice country roll 17@18c

Cheese—New York full cream 11½@12c; Ohios 11@11½c.

Eggs—Fresh, 24@25c; buyers buying very sparing y..

WASHINGTON, D C., Mar. 6—Butter—Market weak. Extra 20½c, firsts 20c.

BUFFALO, N. Y., Mar. 6—Butter—Extras 20c, firsts 19c; best imitations 16c. Large accumulation of extras in receiver's hands.

Eggs—20c.

NEW YORK MARKET.

NEW YORK, March 4th, 1899.—Butter—Receipts for the week, 31,754 packages; exports for the week, 4,407 packages.

Market dropped to 21c early in the week, trade was steady and receipts well cleared until Friday when there was an accumulation of stock and offerings at 20½c without attracting buyers; at the close 20c is the extreme price for extras, and the trade is looking for better demand and steady prices for the balance of the week.

Exporters bought only fresh goods, and we note sales for this account of fresh imitations at 15@17c; and lines of fresh ladles at 13@15c.

Old butter is only inquired for in a small way, with sales finest June creamery at 16@17c, and good lots at 15c. Odds and ends of N. Y. state dairy is selling at 13@15c. We quote:

Creameries, extra, 20c; medium, 18@19c; poor, 15@17c. Dairies, extra, 18½@19c; medium, 15@17c; poor, 13@14c.

Cheese—Receipts for the week, 8,719 boxes; exports for the week, 4,230 boxes.

Trade from all over were in the market for few cheese this week, and the result was an active market at steadily advancing prices, culminating to day, Saturday, at 11½c for finest large cheese and 12@12½c for best small sizes. White cheese had the call and sold at ¼c premium over colored and are in light stock, few hands, and firmly held at quotations. Holders are not anxious to sell any considerable lines of cheese at present prices and are dealing out their stock in small parcels feeling that higher prices will be reached before new make comes on the market. We Quote:

Full cream, large, extra, 11¼@11½; medium, 10@10¾; poor, 8@9; small, extra 12@12½; medium, 11@11½; poor, 8@10.

Eggs—Receipts for the week, 15,777 cases.

Market left off week ago at 35c, then took a big tumble early in the week to 23½c and again suddenly advanced to 30c, then went back to 27c, and closes up with stock all cleaned up and prices firm at 28c. We quote: Fresh eggs from all sections, 27@28c per dozen.

DAVID W. LEWIS & CO.
177 & 179 Chambers St.

FOREIGN MARKETS.

BOSTON, March 4—Cable advices of this date from the principal markets of Great Britain to Geo. A. Cochrane give butter markets as dull and lower The expected diminished arrivals from Australia do not materialize; they are continuing quite liberal. There has been quite a pressure to sell and prices have given way 2@3s on the week. Finest Australian is to be had at 21c with very good offering at 20@20½c. Canadian brings about the same money as Australian, when in boxes. American butter has been a dragging sale, the weather is against business and as none of the American butter is strictly fine it meets with a very slow sale at very irregular prices. Creameries have sold all the way from 17@19½c, finest imitations selling the best of any American, prices ranging from 16 @18c. Ladles have become a dragging sale at anything over 14@14½c, occasionally 15c is made, but it is for the very best description.

Cheese markets are a bit firmer in sympathy with the improved conditions in America and Canada, but there is no speculative buying at the moment. Finest Septembers are to be had at 10½ @11c; the demand for under grade continues good. Anything from 10c downwards in active request and small supply.

LIVERPOOL, Mar. 6—Butter—Finest United States, 94s; good 65s,

Cheese—American finest white and colored, 49s.

HIGHEST PRIZE HONORS

— FOR —

Cream Separators.

The DeLaval Cream Separators have received nearly Two Thousand Prizes, Medals, Awards and Diplomas, during the twenty years they have been before the public. Five Hundred of these awards have been Prizes and Medals from Fairs and Exhibitions of marked importance The collection is representative of every World's Fair and International Exposition during such period, every state and almost every county of the United States, and every civilized country and province in the world.

At the World's Fair, Chicago, in 1893, the DeLaval Cream Separators were solely selected by the Official Committee of Experts and Experiment Station Representatives for use in the practical Working Dairy of the Great Fair, where their work received the highest possible commendation. And in the Exhibition Department they received except onal honors in being awarded the only Medal and Diploma regularly given to centrifugal creaming apparatus.

In the later World's Exposi ions, at Antwerp in 1894 and Brussels in 1897, the DeLaval machines well sustained their previous Fair and Exhibition record and further demonstrated their overwhelming international superiority. They received the Grand Prizes at each of such expositions.

The only important Exposition competitive exhibits of cream separators during 1898 were at Munich, Bavaria; Luxembourg, Germany, and Vienna, Austria. In each instance the Highest Award went to the "Alpha" DeLaval machines.

READING NOTICES.

All Reading Notices under this head are at the rate of 25 cents per line.

For Sale—Registered Guernsey bull one year old. Large of his age, and a splendid animal. He is worthy of a place at the head of a registered herd. From a tested cow. C. R. BRIDGMAN, Darlington, Wis.

Thoroughbred—Ayrshire Calves for sale. Address J. M. HARRAN, Malone, N. Y.

For Sale—Several De Laval farm separators, or will exchange for cows or calves. Address P. M , Four Corners, Iowa.

For Sale or Exchange—Guernsey Bull Honorius 3361, Dropped March 9th 1893. Also his son dropped March 18th, 1898. Solid light red color. Write for prices, etc. WM. H. SWARTZ, Box 119, Waukesha, Wis. 4-2

For Sale—A first-class creamery 25 miles from Sioux City. Write for particulars and terms. DEWITT GOODRICH, Climbing Hill, Ia. 3-3

Public Sale—Of Stock and Farm implements, on Wednesday, March 22, 1899, on Bloomfield Cottage Farm, on Marlton Pike, 3 miles from Camden, consisting of the following: 22 thoroughbred Jersey heifers, age 6 weeks to 19 months old, entitled to registry in the A. J. C. C.; 2 fine bull calves; 7 graded heifers 2 years old, Jersey and Guernsey, sired by Guernsey bull Traveller's Boss 2887. These heifers are all with calf and will be in profit soon; also 4 horses, wagons, carriages, harness and grain. Sale 1 oclock sharp. No postponement on account of the weather. 5 months' credit given. SILAS BETTS, Camden, N. J.

For Sale—The finest 160 acre farm in Cottonwood county, Minn., 25 miles from the Iowa State line: 2-story house, 24x30, with 1-story addition 12x14, granary 24x24, barn 24x48 and 24x40. All in good condition, and situated in fine grove; large and small fruits on place; rich soil and no waste. Must sell, and here is a bargain for you. Prices low and terms easy. Call on or write at once to THOS. E. SIME, Windom, Minn.

For Sale—A first-class cheese factory six miles N. W, of Appleton. Good location and everything in first-class shape. For particulars address. NICK HUSS, Appleton, Wis. 4-3

Cheese Maker Wanted—Address S., care HOARD'S DAIRYMAN, Ft. Atkinson, Wis.

For Sale Cheap—Farm of 120 acres. One mile from P. O., creamery, and depot. Good and new buildings. Everything O. K. A bargain on easy terms. Address F. R. CONSTANCE, Waupaca, Wis. 4-2

Wanted—A good working dairyman to take charge of 100 head of milch cows. Applicant must be thoroughly competent and not afraid of hard work. Address BONNE TERRE FARMING & CATLLE CO., Bonne Terre, Mo. 3-2

Wanted—Position as butter maker, in North ern Iowa. Best of references furnished. Am capable of running any machine, Can do my own plumbing Wages reasonable. Address RICHARD KAUNZNER Fairfield, Rock Co., Wis. 3-2

A Bargain—Full blood Jersey cows not registered, 2 and 3 years old, 8 head. Excellent breeding. H. M. EBBOTT,, Fort Atkinson, Wis. 3-tf

For Sale, Cheap—Dairy farm 116 acres near fine college. 2 houses, 3 barns, 3 silos. F. M. SWIFT, Olivet, Mich. 3-2

Position Wanted by a first-class and temperate butter-maker. Address L., care Hoard's Dairyman. 3-2

Hermanville Tamworths, Cross-heds, etc. J. A. MACDONALD, Hermanville Farm, P.E.I., Can. 32-52

For Sale—One first-class creamery and skimming station, DOWNING MFG. CO., Downing, Wis. 35-tf

An Entire Carload—Of high graded Jersey cows and heifers are in my hands for sale immediatley. F. H. MERRELL, Portage, Wis. 52-tf

For Sale—A very desirable and good paying dairy, consisting of 20 head, or more of Holstein graded cows; average milk sales of two hundred dollars per month. C. H. ELLIS, Waxahachie, Texas. 52-tf

Wanted—To trade a 43-acre farm, good six room cottage, and barn. Land rolling, and nearly surrounded by oil wells, producing from 10 to 400 bbls. per day, ½ to 3 miles away. Situated 10 miles from Parkersburg, 4 miles from railroad. Will be sold for high grade or full-blood Jerseys or $1,500.00 cash. This is cheap outside of the prospect for oil. Don't write unless you have first-class individuals. Also will sell or trade 416 acres of fine coal land in Kanawha county, 6 miles south of Charleston, Davis' Creek. R. R. runs through property. 95% of land underlaid with three seams of coal, one seam, 40 in., is free from any slate and with a bare trace of sulphur. There is no finer bituminous coal in West Va. Will take $5,000,00 worth of full-blood Jerseys and $5,000.00 in notes of one, two and three years. Titles guaranteed, J. F. WOODYARD, Parkersburg, West Virginia. 2-4

Lands in Wisconsin Cheap—The Chicago, St. Paul, Minneapolis & Omaha Railway Company has upwards of 400,000 acres for sale in northwestern part of the state at low prices and on long time. These lands are most desirable because of their proximity to the markets of Minneapolis, St. Paul, Ashland, Eau Claire, Duluth and Superior. If you wish to visit these lands homeseekers cheap excursion tickets can be secured at C. & N. W. ticket offices in Chicago, Milwaukee, Janesville, Beloit, Elgin, Aurora, St. Charles and Dixon March 7th and 21st. Maps and information furnished on application to G. W. BELL, Land Commissioner, Hudson, Wis. 2-4

Home Seekers' Cheap Excursion—The North-Western Line will sell home seeker's excursion tickets February 21, March 7 and 21, with favorable time limits, to numerous points in the West and South at exceptionally low rates. For tickets and full information apply to agents Chicago & North-Western R'y. 32-3

The Dual-Purpose Cow in Montana.

Average 175 Pounds Butter—Value of Calf Not Given—Ration Formula—Bloat Prevented.

ED. HOARD'S DAIRYMAN:—I come as penitent as may others have, for information.

I have been dairying for 15 years, with a dual purpose cow. My reason for it was to keep the standard of my herd up. When you are dairying and stock raising both, it is hard to keep the dairy stock out of the herd, so I chose the dual-purpose cow for that reason, not from choice, for I see, from reading your paper, that the special-purpose cow makes twice as much butter as mine. I get an average of 175 pounds to the cow. Milk mostly in summer; have had trouble in getting cows to come in in the fall. I have followed the advice of your paper in that respect too.

We have a good range here. I do not count anything for pasture; I have 70 acres of alfalfa, cut about 4 tons per acre; have raised it for 10 years; find it much better than wild hay for milk. Am milking 30 cows, taking your advice in regard to winter dairying; have a No. 2 DeLaval separator. We have raised the standard of our butter 25 per cent by the hints in your paper.

Please formulate me a ration from the following feeds: Alfalfa hay, second cutting, good, $7 per ton; chopped oats $22; chopped barley $18 per ton; bran $18 per ton; oat straw $1 per ton. Oil meal would have to ship from there, would cost about $3 per hundred.

I see a great deal in your paper about bloat; have lost a good many cattle with it. Three years ago I noticed those cattle that I turned on off of the range did not get it, so I have made it a point since to get them filled up on other grass and turn them on, and keep them on continuously, and have not lost a hoof since. Being wet does not make any difference; neither does frost. Their being hungry and their stomachs being empty is what does it. It generally is a very rank growth, and they hog it down, and it forms a gas that does the work.

Montana. A SUBSCRIBER.

Our friend has some extra good dual-purpose cows, and is giving them extra good *dairy* care and feed, but they do not pay him as well as good dairy cows would. If he is satisfied, or others similarly situated and doing as he does, are satisfied and prefer to keep on, it is not for us to object.

We suggest that he try a formula somewhat as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
12 lbs. alfalfa hay	10.99	1.32	4.75	.14
8 lbs. oat straw	7.26	.10	3.08	.06
5 lbs. bran	4.40	.63	1.93	.15
5 lbs oats	4.45	.46	2.37	.21
Totals	27.10	2.51	12.13	.56

If more straw or hay will be eaten, it should be fed.

Scientific Dairy Farming.

Old and New Methods.

ED. HOARD'S DAIRYMAN:—I meet many farmers who ridicule the term "scientific farming;" they say that the methods taught by the agricultural papers and farm institutes are adapted to only fancy farming by people who have plenty of capital, and that the average farmer with only a small capital cannot make a living if he should practice them. Recently, after returning from a dairy convention, I met some farmers in the village store, and the conversation turning on the convention, the opinion expressed by most of the farmers was that the teachings of the scientific dairymen were of no use to them, their ideas would not work if put in practice on their farms, and that any of these farm institute speakers could not take their farms and make a living from them.

These farmers referred me to well-to-do farmers that had made all their money by practicing the old way of farming, but it is a significant fact that these farmers admitted that neither they nor the farmers they mentioned, were now making any money. I tried to show them the true meaning of scientific farming, and that there had been an entire change in the methods of production and distribution in the last 25 years, and that farmers must now adapt their plan of farming to the new order of things.

The true meaning of science is knowledge that can be reduced to some order or system. If I have any knowledge of anything gained from experience or observation, if I can verify it, then systemize and classify it, so it can be intelligently expressed to others, then I may call it science. If I have a theory of anything, it is not science. If I, or any one, have theories about farming that we have not worked out until they have have become actual knowledge, the term scientific farming would be a misnomer if used to describe our theories. When I hear farmers sneer at scientific farming, I want them to understand what the words mean, then the use of them would become reputable among them and they will understand each other when talking about "scientific farming."

What many farmers now need is to realize the radical changes that have taken place in all the methods that have to do with the production, distribution and consumption of dairy products, then if there is any scientific teaching that will help him to adjust his methods to meet the changes that have taken place, he should avail himself of them.

Twenty-five years ago, when I was living on my father's old dairy farm, every cow was fresh in milk in the spring, the most of the butter was made during the summer months, and packed in firkins. Every fall we could depend on several butter buyers coming to our home to buy the butter. The cows were dried off in the fall, or early in the winter, and no more butter was made until the next spring. In those days the production of butter was confined to a few Eastern states, and there was a demand in the large cities for all the butter—old butter, too—at good prices. Then came the inflation prices of the war times and a great opportunity was given for farmers to pay for their farms, if they were bought at the right time.

This method of farming was adapted entirely to summer dairying. The only grain fed the cows was a little in the spring, before grass, and this was grown on the farm. The butter was all made at home by the farmer's wife, and the expense of drawing the milk to the creamery, and money paid for making the butter was saved. The breadstuffs and vegetables used by the family were all grown on the farm, taxes were less, less was spent for the comforts or luxuries of life, and the social demands were less, so the economical farmer could save more money than the farmer of the present time.

I do not say that he could make more than the enterprising farmer of to-day, but that the processes of dairying being nearly all conducted on the farm, and being less a consumer of other people's products, he could live and save money on a smaller cash income than he can now. Butter making has been relegated to the factory, and the demand now is for fresh butter, so the farmer must practice winter dairying, to hold his trade with the factory. The butter buyer, instead of going to the farmer, now goes to the factory where he can buy butter in large quantities that is of the highest quality, and uniform in grade. The Western states have become butter making states, and with their cheap grain and transportation facilities, they can under sell the Eastern dairymen in their own markets, and still make larger profits.

The result of a large production of any article, and intense competition, is that the standard of quality is raised. The market demands a better article, and inferior goods are of little value. The fact is, that the dairyman of to-day is *compelled* to produce a better article, and produce it cheaper than at any other time. He must patronize the creamery in order to sell his product, he must pay the creamery for manufacturing it, and he must produce a part in the winter when it costs him more, and there is only one way for him to meet the changed conditions of things, and that is to produce his milk at a less cost.

The old methods of farming that I have described will not do, and the farmer who tries to make them fit with the present order of things, will soon find his mistake. If our agricultural papers, and dairy conventions, and farm institutes can tell us how to make fair margins in these times, we want to hear from them. If we have men who have studied the situation, then have gone to work and made their farms pay good profits, by what has been called "scientific farming", they should have something to tell us. When they tell us that the silo, clover, soiling crops, testing their cows to see which pay a profit, and warm stables with tight gutters that save all the liquids, have helped them to solve the problem of reducing the cost of production, we may rightly call it "scientific farming", and we will do well to make it our study. W. J.

Delaware Co., N. Y.

Form and Function.

Views of a Holstein-Friesian Breeder.

ED. HOARD'S DAIRYMAN:—The discussion carried on between the *Breeder's Gazette* and HOARD'S DAIRYMAN has suggested to my mind some thoughts that I am inclined to transfer to paper, for the reason that "square-endedness" was a term that my father often used when I was a boy, and that the cows possessing the opposite conformation he called "pumpkin-splitters." If the Associate Editor of the DAIRYMAN will let his mind wander back to the days of his boyhood, when his mornings and evenings were spent in the cow yard, and he helped me to drive the cows to and from the pasture, he will well remember that there were no "pumpkin-splitters" in my father's herd, which at that time was giving more milk and producing more cheese per cow than any other herd in Madison Co., N. Y. They were bred from Short-horn bulls of the milking strain, crossed on the best native cows, and some of them having several crosses of Short-horn blood. They had straight lines, clean, blood-like heads and necks, and were well up in "square-endedness."

Perhaps the impression this herd made on my boyish mind, so warped my judgment that I have never since been able to see much virtue in a "pumpkin-splitter," although I will be fair and own that there are some good ones among cows of that conformation. But after experience and observation have taught me that a cow to stand up under the heavy strain of milking and breeding must have two ends to her. It seems to me that it is not necessary that a cow must be cut out like the new moon from her rump to her hock, with a sloped rump, prominent chine, with the crops deficient, with high shoulders, and with angularity all over, to be a good producer. I have seen good ones among them, but I have seen just as good, yes, and better, possessing the straight lines.

There are some doggeral lines, more familiar to a former generation, expressing so many of the good points of an up-to date cow that I hope I may be pardoned if I copy them:

She is long in her face, she is fine in her horn,
She'll quickly get fat without cake or corn;
She's clean in her jaws and full in her chine,
She's deep in her flank and wide in her loin.

She's broad in her ribs, and long in her rump;
A straight and flat back, without ever a hump;
She's wide in her hips and calm in her eyes;
She's fine in her shoulders and thin in her thighs.

She's light in her neck and small in her tail;
She's wide in her breast and good at the pail;
She's fine in her bone and silky of skin;
She's a milkman's without and a butcher's within.

There are angular, ungainly cows in every breed, and some of them are good producers, but do such cows represent the typical dairy animal? I think every dairy breed has a scale of points. I am not very familiar with any of them except the Holstein-Friesian, but I doubt very much if any of them give points for crooked lines or ungainly conformation.

There are some breeders that seem to go wild over some sport or some cow that has made a large record, no matter whether she is a roach-back or a sway-back, whether a "pumpkin-splitter" or a "square-ended" one. If she is only good on paper, that is enough. They don't seem to care about whether she is a typical dairy cow and capable of conferring the characteristics of a dairy

cow upon her offspring. They forget that there are scales of points of the different breeds, and that it is not only the privilege, but the duty of a breeder to breed as closely as possible to the scale of points of the breed he is handling.

I believe that it is conceded by every good judge of dairy stock, that a loose structure is conducive to milk production; but this does not mean that the dairy cow should be ill shaped, or that she should look as though she was put together hap-hazzard. It only means that the bones in her frame work should be far apart, indicated by the open ribs and joints of the vertebrae, and by the hollows in the shoulders and thigh pits. The breeder who breeds to type, guided by the scale of points, is, in the end, the successful breeder; or in other words, he who breeds typical animals from the great producers, and drops all animals not typical, will, in a short time, have reason to be proud of his herd.

As I have already said, perhaps my early training has warped my judgment; those who know me best can better determine. I have handled dairy stock in Central New York for the past fifty years, and the cow that comes the nearest to my ideal of a dairy animal, is the typical Holstein-Friesian, Americanized. The Holstein-Friesian Association have been very wise in their past legislation. They used money and brains without stint with a view to advancing the breed to that point where every animal will be a typical one, and they have tried to educate the breeders in that line of work. Their scale of points is designed to represent the perfect dairy animal. They consider the fair test, the official test, and the show ring as educators. They believe that no man should go into the show ring as a judge of dairy stock unless he can tell when asked, why he makes his awards thus and so. Hence, they have made a list of the best educated men for the fair associations to select from as judges. They believe that the fair is an educational institution for the farmer, and that an incompetent judge brings discredit upon the fair and upon the breed he claims to represent.

The typical Holstein-Friesian, Americanized, is of the milk and beef form. A recent investigator in looking through a few volumes of of the *Advanced Register* finds 108 cows, above five years old, of the milk and beef form, which have to their credit an average record of 18 pounds and 14 ounces of butter in one week per cow; 86 cows of the milk form, which have a credit of 16 pounds and 10⅔ ounces per cow; 4 of the beef and milk form, which have a credit of 16 pounds and 4 ounces per cow. These observations, extending to so large a number of cows, show conclusively, that the association have made no mistake in the type chosen. He also finds that the level backed cow, (through another large series of observations) in average production of butter per cow, per week, exceeds by 2¼ pounds the cow of irregular conformation.

Hamilton, N. Y. S. BURCHARD.

Was it Profitable?

ED. HOARD'S DAIRYMAN:—Enclosed find one dollar for your valuable paper. We find after a trial of a few months that we cannot do without it.

We have been trying dairying in connection with farming about two years. Last year with 12 cows we sold butter and milk to the amount of $1,294.30 at a cost of $614.40. Our cows are grade Jerseys; no thoroughbreds, though I keep a registered bull. Heifers one-half and three-fourths grade give one to one and a half pounds of butter a day when fresh.

We feed with cotton seed meal and hulls, wheat bran and hay. Our heifers milk close up to time of calving; indeed, we have one three-fourths grade that has her third calf that has never been dry since her first calf. Would like to know what you think of our little dairy. Is it worth keeping up or not?

Bill Co., Ga. Mrs. M. E. TUCKER.

When a lady can handle 12 cows as intelligently as it appears Mrs. Tucker has handled her herd, can make each cow and heifer earn in gross over $100 per cow, and from the whole herd receive a net profit of over 100 per cent, it strikes us quite forcibly that she is a past master in the art of profitable and economical dairying. We would say, "keep it up."

With such results we would not advise attempting to raise beef. The effort necessary to beef production, if applied to an enlargement of the dairy, would pay much better. Then, besides, it is evident the lady is endowed with special discernments in the work of handling dairy cattle. Where such is the case, it is better to follow out on such lines and not distract or confuse profitable effort with something else.

Asafoetida for Calf Scours.

ED. HOARD'S DAIRYMAN:—I will give you my experience with asafœtida for sick and scouring calves.

I find that asafœtida is the best medicine for sick calves. It can be fed in a powdered state in their milk.

One small teaspoonful of powdered asafœtida I consider a good dose for a young calf. Another good way to give asafœtida is to dissolve it in a little water or whiskey, put the asafœtida in a bottle, any size you wish, and pour the water or whiskey on it and let it dissolve.

If a calf is very low it is good to give him this dose: one tea cup of warm water sweetened, one tablespoonful of alcohol and one teaspoonful of laudanum.

In about an hour after giving this dose, the calf will take his feed of milk. H. L.

Deer Lodge Co., Mont.

How Do You Keep Your Dairy Accounts?

ED. HOARD'S DAIRYMAN—One favor I would like to ask. Your paper has been very instructive to dairymen in regard to feeding and taking care of cattle. Now I would like to hear from some of the successful dairymen as to what system they use in keeping the books of the business.

I think after a man has learned how to take care of his cattle, it would be of great benefit to him to have a system of book-keeping, whereby he would know precisely how much his business was paying him. H. G. D.-

PLAIN TALKS ON BACTERIA AS APPLIED TO FARM PROBLEMS.

[By Prof. H. L. Russell.]

Second Series, VII.

GLOSSARY.

Milk duct, milk cistern, milk sinus:—The milk as secreted flows out into small channels which empty into others, forming larger openings, known as the *sinus*. These empty into a common cavity of considerable size known as the *cistern*, and from here the milk flows through the *duct* in the teat to the outside.

Indurated:—Said of tissue when it undergoes hardening or solidification.

Mammitis, mastitis:—Inflamation of the mammary gland in the cow; the udder.

CONTAGIOUS GARGET.

Affections of the udder are quite frequent in cattle, and generally these troubles are referred to under the name of garget. Various other names, such as inflammation or congestion of the udder, "caked" bag, and the more scientific expression, mastitis or mammitis, are also used in a similar connection. A common symptom in many of these troubles is the development of an inflamed area that may become hard and dense. The character of the same varies a good deal in different cases. A "gargety" condition is to be ascribed to various causes. Most frequently the difficulty is purely physiological, a simple congestion appearing before, or soon after calving, and undoubtedly associated with the function of maternity. Not infrequently the condition may be greatly aggravated by external causes, a wound or a bruise, exposure, etc. Troubles of this sort however, are not communicable from animal to animal although it is highly probable that many of them are associated more or less directly with the presence of various kinds of bacteria. They are simply accidental.

As opposed to garget produced in this way, there are also inflammatory udder diseases that are contagious in character. These maladies are, without much doubt, produced by the development of parasitic bacteria that find their way into the udder, and there set up the inflammatory action that results in the "gargety" condition. Whether there is more than one kind of germ that is thus able to cause these affections, cannot be declared with certainty at the present time, but there is no longer any question as to the relation of at least one species of bacteria (a streptococcus) to an infectious or communicable garget in cows.

This condition may be determined by the formation of a hard lump at the base of the teat. Sometimes the tissue becomes inflamed and tender before this hardening or induration occurs. The flow of milk is lessened under such conditions, although the general appearance of it is not always materially changed when first drawn, but such milk usually ferments more rapidly than usual. In the more advanced stages the milk becomes thickened and more viscous. In the severest form, the tissue of the udder may reach such a condition that suppuration occurs and the secretion may then become filled with pus.

From the symptoms of the disease this type of garget can be distinguished from the ordinary sporadic trouble which is characterized by the altered character of the secretion (stringy, clotted or lumpy milk) and the early development of local inflammation.

Contagious garget may sometimes be confounded with tubercular garget which is practically tuberculosis of the udder. Both dtseases are of germ origin but the manner and cause of infection differ and in effect one can generally distinguish between the two. The tubercular germ gains access to the udder from the inner tissues of the body. The disease germ spreads through the system by the way of the lymphatic circulation and invades this granular organ, the udder, from above, while as a rule, in infectious garget, the disease germ finds its way into the animal by way of the milk ducts. In tubercular troubles the deeper glandular tissue first shows sign of being affected; in true contagious garget the disease generally begins in connection with the milk duct, cistern, or sinuses.

MANNER OF INFECTION.

The contagious nature of this disease is already well understood, but the manner in which the disease germ is distributed from animal to animal is by no means so thoroughly apprehended. Infection is frequently conveyed by means of the milker. The pernicious habit that is not infrequently practiced, of moistening the hands with a few streams of milk, aids materially in spreading the disease from the affected animal to any others that may not have yet succumbed. The disease germ finds its way into the udder from the outside, by way of the milk duct. In the milk cistern the conditions are very favorable for its growth. As a consequence the milk acquires infectious properties, by reason of the germ life which it contains. The walls of the cistern and sinuses develop a catarrhal condition, while later the tissue becomes hardened and swollen. It is frequently thought that soiled litter or bedding serves to spread the diseased matter, but this method of infection has not been definitely determined.

TREATMENT.

Inasmuch as the disease is of germ origin, no method of treatment strikes at the root of the trouble, that does not destroy the bacterial life in the affected organ. This can only be done by injecting antiseptic solutions into the milk cistern. For this purpose, Nocard found that a lukewarm solution of boracic acid (4%) introduced immediately after milking, was very effective in destroying the organism. The streptococcus of this disease appears to be especially susceptible to the action of this acid.

Much can be done to limit its spread, by using such precautions as will prevent the microbe from finding its way from udder to udder. In milking the herd, animals showing a "gargety" condition, should be milked last. Recognizing how often the milker serves to carry the disease, the hands of the milker should be thoroughly washed in a disinfecting fluid. For this purpose a 2% carbolic solution will suffice. The teats and lower part of the udder should also be moistened, in a similar way, to destroy any germ life of this character that finds its way to the outside of the animal.

Questions Answered.

1. Have you tested your herd, by weighing the milk and the Babcock test, to find which were the poor cows?

2. How long did you test, and how many did you reject? (Give the whole number of the herd at the beginning of test.)

3. Is it much trouble or expense to do this, and what plan did you pursue?

4. Have you ever taken a herd of common cows, placed a registered sire at their head, and so kept up the system until you brought out of it a herd of grade cows?

5. What was the breed you selected, and how much more butter, cheese, or milk did you get from the daughters than from the original mothers?

6. Would you advise changing breeds, one after another, or breeding right along in the same line?

7. Have you ever bred the daughters back to their own sires, and if so, what was the effect on the health and dairy capacity of the granddaughter?

Ed. Hoard's Dairyman:—1. Yes.

2. Forty-eight hours test; six months apart. July and January. Forty cows. No rejections.

3. Experts were sent to my farm for this purpose, free of expense to me, from State Experiment Station.

4. Yes.

5. Ayrshires; 2,000 pounds per annum increase of milk from each grade above what I had been getting from their dams.

6. Always breed in the same line, and invariably use a pure bred sire.

7. They were finer, but, in most cases, less hearty, and less profitable in the dairy than animals not closely inbred.

My common stock dairy averaged 4,000 pounds each per annum, my grades 6,000 pounds, and my full bloods, with which my farm is now stocked, 7,000 pounds. The average of all the cows in this state is only

SPRAYING FRUIT TREES.

The question of spraying fruit trees to prevent the depredations of insect pests and fungus diseases, is no longer an experiment but a necessity.

Our readers w ll do well to write to Wm. Stahl. Quincy, Ill., and get his catalogue describing twenty-one styles of Spraying Outfits and full treaties on spraying the different fruit and vegetable crops, which contains much valuable information, and may be had for the asking.

Parted In A Dream—(New) A love song founded on a strange incident of the late war—words and music by Halbert L. Hoard. (A 50 ct. song.) Sent post-paid for 25 cts. to readers of Hoard's Dairyman.

Darling Lenore—(New) A song of deep sentiment by the same author, published Jan. 25, '99. (A 50ct. song.) Sent post-paid for 25 cents to readers of Hoard's Dairyman.

For 3 cts. I will send words of both songs with with miniature page of music of each.

HALBERT L. HOARD, Fort Atkinson, Wis.

3,000 pounds, and nine-tenths of the dairymen of this state breed from scrub or grade stock, rather than pay $10 for a thoroughbred bull calf for grading up their stock.

Allegany Co , N. Y. L. D. S.

ED. HOARD'S DAIRYMAN:—1. I own a Babcock tester, and use it when I want to on whole milk, skim (separated) milk and butter milk.

2. Had six cows and rejected two of them.

3. (a) It is not much trouble to make a test and but little expense.

(b) I cannot answer this unless I would say I went strictly according to directions of the maker of tester. I have never had the least trouble in making any kind of a test.

4. I had common cows, that general purpose kind, when I commenced the butter business, but soon found they were money losers, and bought registered Holstein-Friesian. I make as much butter now from one cow as I did from two general-purpose.

6. I would not advise changing breeds for various reasons.

7. Have had no experience. Kind reader, actual experience tells me to let this "general-purpose cow" severely alone. May you, new or intending beginner, profit by my loss. Buy "beef cattle" or "dairy cattle." I. R.

Wabash Co , Ind.

ED. HOARD'S DAIRYMAN:—1. Yes.

2. My herd will average eight. My plan for testing is not to weigh the milk and take tests for any great length of time, but always make them when cows are on luxuriant pasture, and when I change the feed. I do not condemn hastily, but when a cow continues to make a poor average for all the tests, in comparison to the rest of the herd; makes the butter that she makes cost me, on an average, over 10 cents per pound, I sell her to the butcher. The question has been with me, not altogether how much milk they give, or what per cent they test, but how much do they make it cost me, and every summer I have one or two cows for sale.

3. Yes, if you make a good test, it is quite tedious, but not expensive.

4. Yes; began with good cows and used registered sire.

5. Jerseys. Have not had one heifer to come up to my old cows yet.

6. Stick to one kind, by all means, and let that be the kind you take the most fancy to.

7. Yes, once. Had two teats on one side grown together, and would not breed; so I can't tell what effect on dairy capacity, but I judge she would have been the poorest cow on the farm. I won't do that any more.

I seldom write to any paper, but you "DAIRYMAN" people are very courteous and treat everybody fair and right, so I thought I would tell what little I knew about your questions in regard to that great animal, the cow. C. A. S.

Ohio.

ED. HOARD'S DAIRYMAN:—Will try and answer your list of questions.

1. Until I was satisfied I was keeping some cows that were not giving me value received for the feed I was giving them.

2. I am still testing and am rejecting; started with twelve, have six of the original number left, have twelve at present by adding heifers to my herd.

3. It is some trouble to test but not as expensive as to keep cows that are eating up fodder they are not paying for.

4 Yes.

5. Selected a registered Jersey sire to breed up from; am using the third sire since I first commenced to grade up. They have increased about fifty lbs. a cow per year since I first started to grade up. But I must stop here and give HOARD'S DAIRYMAN some of the credit of the increase of butter per cow as they receive better care now.

6. No. Stick to the breed you have started with; do not mix them up.

7. Yes. The health and dairy capacity seems to be all right as far as I am able to judge, but they are not old enough to give a final decision, only with first calf.

I will add one question more which is not in the list and I have failed to see discussed in the DAIRYMAN. Which cow is the more profitable, the one that gives three per cent milk or the one that gives six per cent and gives half the amount? B. B. W.

Beaver Dam, Wis.

ED. HOARD'S DAIRYMAN:—1. Yes.

2. I have tested at different times for 2 years. I did not reject any cows. First year 10 cows, second 12 cows.

3. No. I took samples of the morning's milk also night's milk, also noon's milk, when milking three times a day, I milk the cow dry, mix it thoroughly, then take sample; tested them separate and have mixed them, tested as soon as I could after milking.

4. Yes. I intend to continue.

5 Holstein.

6. No. Breed right along in the same line.

7. No, nor don't intend to. I have not been in the dairy business only little over three years, so I am unable to answer all the questions.

At the annual cheese meeting to-day some of my neighbors said they could feed butter fat into the milk, I contradicted and they wanted to bet; I asked how they did so and one said by feeding ground oats and peas; another by feeding green corn fodder. They are people that don't read the DAIRYMAN, nor any other paper, and if you give them the paper to read they would say, I don't believe it. W. S. W.

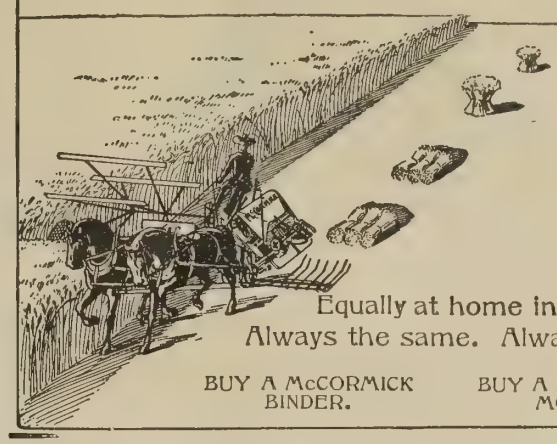
Fond du Lac Co., Wis.

HOW A COUNTRY EDITOR UNDERSTOOD IT.

We have often been amused at the "stuff" which is stuffed in the "dairy departments" of country newspapers, edited evidently by machinery, but here is an interpretation straight from the shoulder in a South Dakota paper.

The interesting fact has been brought out at the Sioux Falls meeting, that one can get from a pint to a quart more milk in a week from a cow, by warming the water, and mixing two spoonfuls of opodeldoc in a barrel of spring water, heated slightly, with two stacks of saw dust stirring slowly, after which set aside and allow to cool to about 70 degrees Farenheit. Let it harden and then saw up in stove lengths and burn in a heater.

The farmers who read that paper must feel greatly refreshed over the solid chunks of dairy wisdom they get from such a source.



Cheese Makers in Washington.

ED. HOARD'S DAIRYMAN:—I wrote a short letter to you some time ago about a remedy to cure clover bloat in cattle, also stated that cheese makers were scarce in this part of the country. Since that time I have received so many letters that I couldn't answer them all, so would like to say through your columns, that a few good cheese makers are employed in this county at $25 to $50 per month, according to size of factory. I would refer them to P. McIntoch & Chase, Ray, leading factory now of this county.

Tellamook Co., Wash. WM. R.

New York State Dairymen's Association. Annual Meeting at Gouverneur.

Butter and Cheese Scores and the Officers Elected.

ED. HOARD'S DAIRYMAN:—Never in the history of this old association was there ever seen a like exhibit of dairy products as was shown at Gouverneur. More than 1,300 samples were on exhibition, and nearly or quite one-half the counties of the state were represented. Mr. Krocker, who scored the butter, said he never before saw so large an exhibit of dairy butter, or one which scored so high. It was, on the whole, quite better than was the creamery; while the cheese was very fine. All in all, the exhibit was fully one hundred per cent larger than that at the state fair last fall.

As the DAIRYMAN'S bailiwick now extends, not only over the "wild and wooly west", but the Empire state and the world at large, and, as all its readers are, or will be, interested in the score figures of the meeting, I herewith send them somewhat condensed.

CLASS ONE.

Creamery Butter—D. E. Boyer, Downsville, six entries, scores, 93 to 95 points; Clark Marshall, Summerville, four entries, scores 87 to 93; R. R. Colton, Richville, one entry, 90; C. L. Morelton, Hopkinton, one, 92; Henry Ebbert, Otisco, one, 95; Peter Langwell, Sodus, three 92 to 94; Thomas S. Rutherford, Shipman, three, 89 to 93; D. W. Westcott, Moira, one, 94; Ayer & McKinney, Meridith, three, 94 to 96; Edward VanAlstyne, Kinderhook, two, 92, 93; Hobart Dairy Co., Hobart, one, 95; F. X. Beaumert & Co., Antwerp, four, 93 to 95; W. E. Spurr, Sennet, one, 94; C. H. Jones, Winthrop, one, 91; Mather Brothers, Belleville, one, 92; Rockdale Co., Rockdale, two, 95, 95¼; G. W. Barnasky, West Coxsackie, two, 94, 96; Charles S. Smith, Sidney Center, one, 95; J. P. Hoetkin, Gouverneur, four, 91 to 95; L. L. Dewey, Laurenceville, four, 94 to 96½; Day & Goings, Halsborough, three, 89 to 91; Elgin Butter company, Scotsburg, one, 92; L. R. Nye, Converse, one, 92; C. P. Root, Gilbertsville, one, 90, D. G. Donahue, Charlotte, Vermont, two, 92; F. H. and F C. Leonard, Crary's Mills, one, 95; Maple Grove, Newark Valley, two, 94, 95; J. F. Hodgkin, Gouverneur, three, 93 to 94; F. H. Lalone, De Kalb Junction, one, 90; A. W. Overæker, Gouverneur, one, 90; J. E. Strong, Potsdam, two, 90, 94: W. E. Hitchcock, Savanah, one, 95; Rosemary Creamery, Adams, two, 94, 95; Duplicate prints, 94; Rosemary creamery, Adams, three, 94 to 96½; W. V. Beach, Charlotte, Vt., one, 93; John P. Douglas, Theresa, two, 95; Fred O'Brien, Lowville, one, 96.

There were other entries, but their scores were so low they were not noted in the list of awards.

CLASS TWO.

Dairy Butter—A. C. Bigger, Pepacton, four entries, 94; H. W. How, Madrid Springs, five, 94 to 95; J. W. Marshall, Sommerville, one, 90; R L. Colton, Richville, six, 91 to 94; Chester Burs, Eastbrook, three, 93 to 94; Mrs. Nettie Merz, Lowville, one, 94; Daniel Griffiths, Elmdale, three, 90 to 91; Martin J. Winsor, Hartwick, four, 94 to 95; C. P. Miller, Edicks, two, 96; Austin Leonard & Son, Troy, Penn, two, 91, 94; Harrison Lee, North Stockholm, two, 94; Stockholm Duplicate tubs, three, 94 to 95; Jno. Ennes, Pattersonville, one, 95; Jared Van Wagenen Jr., Lawyersville, two, 94 95; Daniel Griffith, Elmdale, one, 93; Nelson St Dennis, Potsdam, one, 92: Geo. W. Sisson, Jr., Pottsdam, three, 92; Egbert Stillson, Sidney Center, one, 93; W. Mc Kerrow, Middleville, three, 94 to 95; Dodge and Richardson, Gouverneur, ten, 92 to 95; F. J. Bellinger, Ogdensburg, one, 95; Thomas Rutherford, Shipman, one, 93; J. Mc Harron, Malone, 98; O. J. Woodard, Rodman, one, 93; Thomas F. Telford & Son, Meridale, one, 90; C. E. Coleman, Perry Center, 93; L. J. Neer, Jefferson, one, 93; John T. Mc Donald, Delhi, one 94; M. E. Pitt, Crary's Mills, two, 93; Dodge & Truax, Gouverneur ten, 92 to 93; Mrs. George Bonfoy, West Windfield, one, 91; Mather Brothers, Belleville, one. 94; Jno. Livingston, Morley, four, 91 to 95; Samuel Coon, Morley, one, 95; P. R. Taylor, North Hammond, one, 89; Warren E. Gannett, Smithville, two, 91, 92; M. J. Radokey, Colchester, one, 93; Frank G. Hildreth, Herkimer, one, 93; T. W. Ells, Bigelow, four, 91 to 93; Charles H. Peabody, Gouverneur, two, 92, 93: M. L. Howard, Pierrepont, one, 94; H. D. Baker, Gouverneur, one, 94; E. B. Howard, Pierrepont, one, 93; H. B. Baker, Gouverneur, one, 93; M. L. Howard, Pierrepont two, 92, 94; R. M. Brown, Gouverneur, five, 92 to 94; L. F. Collins, Fowler, one, 95; S. Miller, Algona, two, 95; D. H. Miller, Algona, two, 94; J. N. Baum, Potsdam, two, 89, 90; O. V. Austin, Narwood, five, 88 to 91; M. D. Thompson, Malone, two, 95; Anson H. Condrat, Morristown, three, 94 to 95; H. N. Waters, Lowville, two, 90, 94; Thomas Mills, Gouverneur, one, 92; James H. Danforth, Philadelphia, N. Y., one 90; Ellerslie Stock Farm. Rhinecliff, one, 94; Edwin H. Chase, Chase, two, 93: Will E. Kay, Herkimer, one, 95; Amos Wait, Gouverneur, three, 91 to 95; W. M. Scripture, Hermon, four, 93 to 95; Henry Bucklen, Gouverneur, 94; W. Ells, Bigelow, one, 91; D. G. Donahue, Charlotte, Vt., one, 95; Myron J. Scott, Hailsborough, two, 89, 91: W. Wheeler & Son, Potsdam, two, 94, 95; H. B. Baker, Gouverneur, one 92; Peter Allen, Hammond, one, 92: Erwin Allen, Hammond, one, 95; Mrs. F. E. Dawley, Fayettville, two, 96; Fred O'Brien, Lowville, one, 96; E. R Turner, Popes Mills, two, 93; William Gilligon, Lowville, one, 96; F. L. Colton, Richville, three, 91 to 95; Mrs. Wm. Lawyer. Brasie Corners, three, 90 to 94; Effie A. Gillete, Stockholm, one, 93; Morgan Wood, Martinsburg, one, 91; J. W. Marshall, Sommerville, one, 86; George W. Masher. Gouverneur, one, 93; C. H. Scott, Gouverneur, four, 92 to 95; W. A. Parks, Gouverneur, one, 92; George Cooper, Morristown, two, 92, 93; Daniel Griffith, Elmdale, seven, 90 to 92; M. J. Johnson, De Kalb Junction, one, 89; W. E. Mills, Weedsport, one, 92; Wm. Gilligan, Lowville, two, 96

As in the creamery class, there were a number of entries that, either because they scored so low, or through some defect of the type written copy given to me, were not noted. Perhaps, like Rip Van Winkle's drink, the judge did not "coundt dis von."

CLASS THREE.

Export Cheese—G. H. Marshall, Sommerville, two entries, 95, 95½, E. L. Finn, Pinchney, one, 96; A. F. Brown, Edwards, two, 94½, 95; J. P. Lewis, Sandusky, one, 94¼; Mather Brothers, Belleville, one, 93⅛; A. Miller, Algona, one, 93; Michael Hatley, Constableville, one, 94⅛; J. M. Fitch, Lowville, one, 99; J. H. Searl, Lowville, one, 98⅛; W. J. McComb, Boonville, one, 93; G. W. Augsbury, Plessis, one, 95; E. A. Hurst, Macomb, one, 95; H. Petrie, Turin, one 96½: D. F. Babcock, Chippewa Bay, one, 96.

CLASS FOUR.

Home Trade Cheese—E. G. Graves, Lowville, two entries, 96½, 97; W. S. Keyes, Philadelphia, one 97; J. A. Merz, Lowville, one 95⅛: E L. Finn, Pinchney, one, 96½; M. G. Fassett, West Martinsburg, one, 95½; E. W. York, Lowville, one, 97; Mrs. W. A. Wheeler, Bellwood, one, 95½; C. M. Henry, Denmark, one, 96; A. and H. E. Cook, Denmark, one, 96; Cook & Otis, Denmark, one, 96½; G. L. Bartlett, Edwards, one, 95½; John Baird, Newport, one 95½; W. E. Gaynor, East Martinsburg, one 98⅛; D. E. Kent, South Easton, one 94; A. P. Brown, Edwards, one, 95; A. and H. E. Cook, Denmark, one, 98; B. M. Graves, Copenhagen, one 96½; Wm J. Fitzgerald, Newport, one, 96½; W. E. Wilkinson, Belfast, one, 96½; A. B. Hargrave, Heuvelton, one, 94½; John Cooper, Macomb, one, 90; A. Miller, Algona, one, 92; William Gilligan, Lowville, one, 97½; W. H. Fitch, Lowville, one, 97½; J. H. Searle, Lowville, one, 98; David Miller, Constableville, one 97; E. C. Curtis, Brasie-Corners, one, 97⅛; W. A Freeman, Gouverneur, one, 95; Homer Smith, Gouverneur, one, 94½; Thomas Mills, Gouverneur, one 89; Fred H. Loucks, Lowville, one, 95½; C. P. Root, Gilbertsville, one, 92½; F. L. Hall, Lowville, one, 96; Frank Goodison, Osborneville, one, 94⅛; F. A. Lalone, De Kalb Junction, one 95⅛; J. L. Wood, De Kalb Junction, one, 94½; A. W. Overacker, Gouverneur, one, 88½; H. Petrie, Turin, one, 96½: A. Lambert, Salisbury, one 94½.

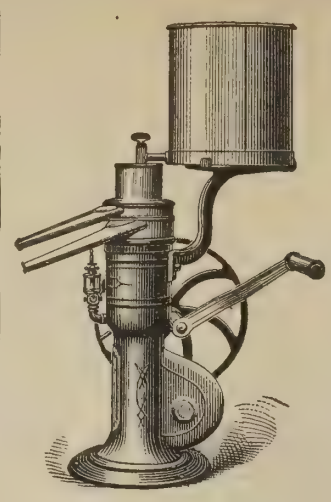
The reader, if he stops to scan the figures, will see that the other counties were not in it with" Little Lewis," when it comes to cheese, just as they never are at the state fairs, but she did not get there in the butter schedules as she ought. But then, the Right Hon. S. Brown Richardson is the president elect of the State Dairymen's Association, and has got blood in both eyes, and to spare. He said to me, "Woe unto any other county between Lewis and Manilla, that shall dare to keep beside Lewis county next year, when the lodge opens in either the dairy or creamery degrees. The fiat has gone out, and our armor has been buckled on. Let the tenderfoots stand aside or be killed in the rush." Nuff said.

CLASS FIVE.

Fancy Cheese—There were several varieties of fancy cheese exhibited but, somehow, the secretary, in making his report, failed to enumerate them, so that the reader will not know of what variety the prize winners were. Following are the scores:

W. S. Keyes, Philadelphia, 94⅛; A. and H. E. Cook, Denmark, 95½; Jared Van Wagnen Jr., Sawyersville, 97; F. X. Beaumert, & Co., Antwerp three entries probably different brands, 99, 99, 99, 94; Eugene P. Norton, Attica, 100; N E. Clark, Potsdam, 94¼; W. H. Fitch, Lowville, 96; J. H. Searl, Lowville, 96; Mrs. F. E. Dawley, Fayetteville, 100; F. Siegel, Gouverneur, 96½; Copley Bros, Seneca Falls, 98; Fred Fuess, Watertown, 98; Fred Feuss, Watertown, 99; H E. Cook, Denmark, 94½.

There were a large number of resolutions presented and adopted, but, being more of a local than other matter of interest, are ommitted in this report.



The newly elected officers are: President, Hon. S. Brown Richardson, Lowville; W. W. Hall, Gouverneur, Secretary; F. E Dawley, Fayettville, Treasurer.

Belleville, N. Y. C. W. JENNINGS.

About "Bacon" Hogs.

Much has been said and written within the last year or two about what it is the fashion to style as "bacon" hogs, and inferentially as vastly superior to anything produced by the hog-raisers of the United States who are content with such breeds as the Poland-Chinas, Berkshires and Chester Whites, and corn as their principal diet. To give an idea of the way "bacon" hogs and bacon making are discussed elsewhere, the following is given from the *Farmer's Advocate*, of London, Ontario, Canada, dated August 20, 1898:

How shall I breed, manage and feed the bacon pig? Will he pay me as well or better than the heavy, fat hog? These are live questions with a host of Canadian farmers, whose appetite for swine-raising was keenly whetted lately by six cents per pound, live weight, Toronto prices. A multitude of counselors have suddenly sprung up to tell the farmers "how to do it," but some of them tend to confusion, not safety, Solomon to the contrary notwithstanding. This is the breed, says one; cross-breeds are the thing, contends another; "feed peas," is the panacea of a third. In an "instructive" circular the other day we read that corn feeding made hard, dry, coarse bacon, with soft, oily, yellowish fat. We once saw the magic "Canadian pea fed" brand—the delight of political editors—going on boxes of bacon from hogs that never tasted a pea

Save Money and Labor by Buying

THE IMPROVED U. S.

TRIPLE CURRENT SEPARATOR

Users say it is **unequalled** for **clean skimming,** durability and ease of operation. They surely ought to know. Read a few of their letters:

The More Used the Better Liked.

RIDGEWAY, WIS., Jan. 9, 1899.
The more we use the Improved U. S. Separator the better we like it. It is as **reliable as a good clock,** and it seems to me that it will be **as durable.** It runs light, does good work, is easy to take care of, and made to last.
THOS. CONVEY, Conductor of Farmer's Institutes.

Takes Out Every Particle of Cream.

SILVINA, WASH., Jan. 2, 1899.
The No. 5 Improved U. S. Separator is all right. It is easy to turn, easy to clean, and takes out every particle of cream. We make considerable more butter and receive 2½ cents per pound more for it. It is the best machine a farmer ever bought. MAX BARTL.

Greatest Labor-Saving Machine.

TURIN, N. Y., Jan. 11, 1899.
The No. 5 Improved U. S. Separator works finely. It is the greatest labor-saving machine for making butter that was ever made. **We could not do without it.** Every farmer should have one. J. BIBBINS.

Remember that in order to have the best, the **TRIPLE CURRENT SEPARATOR,** you must buy the **IMPROVED UNITED STATES.**

Illustrated circulars free on application.

VERMONT FARM MACHINE CO., Bellows Falls, Vt.

A letter by a leading Toronto packing-house, published in the report of Agricultural Commissioner Robertson, states, in reporting on the great excellence of wheat fed pork, that the complaint in England about pea fed pork was that both fat and lean were too hard. The farmer usually gets the blame for everything, including some of the drover's work, but we never hear that any defects in the bacon, "soft" or "hard" originate in the packing-house. Seriously, however, we believe the fair-minded farmer will take the view that he should give heed to the character of hog wanted by the packer, who must understand the market end of the business, so far as is consistent with a reasonable margin of profit over cost of production. Let there be fair dealing on both sides, and an effort to get on common ground. As far as the *Farmer's Advocate* is concerned, we aim to get at the facts based on the experience of our staff in breeding and in feeding swine many years, for both butchers and export packers, extending observations and special researches into the results of experimental work, as well as into the methods pursued on farms where it is made a specialty. Intelligent farmers and breeders who have been engaged the greater part of a lifetime in swine-raising must surely be credited with having learned something about their end of the business.

We have endeavored to set forth the needs of the bacon trade, according to the extended experience of the Ingersoll (Ontario) Packing Company: have briefly reviewed the Danish practice in bacon production, according to Mr. Ginge, a native of Denmark, who is not only at the present time giving his undivided attention as manager of the Canada Packing Co., to the production of bacon of high order, but who was for years closely identified with the Danish bacon trade with England; and facts are given as to the plan of the Irish curers to improve their product.

BREEDING.

On one hand, we have what is termed the special-purpose bacon type, such as the pure-bred Tamworth; and at the other the heavy, oblong style of hog, common in the western states. Besides the various pure breeds, we have the great army of varied grade and cross-bred swine. Canadian breeders for the past ten years have been aiming to conform the leading breeds more or less toward the bacon type, and this has had a corresponding effect on our swine generally, though many marketed are yet far from the packer's ideal.

Now the breed type of sire and dam fixes largely the character of the offspring. It is idle to fancy that any combination of feeds will convert the fat, dumpy Suffolk into the long, deep-sided, lean-meated bacon hog. As well expect a Jersey cow that converts her food into rich milk to be metamorphosed into a four-sided Aberdeen-Angus, beef to the heels. It is the well-bred hog, too, that converts his food into flesh at a profit. He has been bred for years with the object of fixing that power in his nature. For generations several of the chief breeds of swine have flourished, and to-day all merits are not, nor are they likely to be wrapped up in one skin, be it red, white or black; and in our opinion no greater misfortune could befall live stock than to sweep away all breeds but one, even though the curers agreed as to which that should be. Without competition and emulation, progress would cease and degeneracy would set in.

Why does the packer ask for bacon type? No doubt because its product realizes his best profits; hence he can pay more for it, and if more costly to produce the farmer should get more for it. There is less competition in the fancy brands. The United States sends over $30,000,000 worth of pork products to the British markets, Canada less than $6,000,000; so, the less heavy fat pork we produce the less we will have to compete with the vast mass of that character which brings a lower price. The American farmer, with his model of a western Poland-China, for example, and cheap dent corn, especially when picked from the undigested droppings of steers—a common system with them, which we cannot think would ever commend itself to the discriminating nostril of the British consumer—says he can produce so cheaply that he makes just as much money and does it easier, even though he gets less for his pigs than the Canadian. We will surely do better to take our chances at the top. Without dictating as to breeds let the farmer, in the choice of his brood sows (usually grades), and pure-bred males, look to the bacon form, including a good ham, and seek to get with it what is known as a good feeder, according to his best knowledge, judgment and conditions.

Let the young pigs, as they grow up have plenty of exercise, grass to pick in its season, and learn to feed at the trough with the dam. At two or three months they should be going on well. Don't allow them to get stunted on the one hand, nor too fat on the other. Feed them shorts, peas, barley, oats, wheat, etc., mixed with skim milk or whey, so that they will get the elements (protein and ash) necessary to develop flesh and strong bone. At five or six months old, the finishing period, with heavier feeding, will begin. The packer seems to prefer attaining 180 average weight in about eight months, providing that lean dominates rather than fat. The fact is demonstrated beyond question, that as the hog grows heavier it costs more to put on each pound of flesh; but we are not aware that it has been shown, definitely, how the cost of a 180-pound pig at six months compares with that of the same weight at eight months. There should still be moderate exercise, pure air in the pens, and scrupulous cleanliness.

We recommend feeding mixed grains, ground fine, as a rule, and soaked twelve to twenty-four hours before using. By mixing aright we get a ration that will go to make a better class or meat, and, we think, gain in palatability. Something green in summer, and pulped roots in winter aid digestion, and access to the soil promotes good health. If the pigs begin to get disordered and crippled up, vary the feeding and try a mixture of sulphur, charcoal and ashes, salt and a little bluestone, placed in a separate box or trough where they can take it at will. In a very and clear and able article, Professor Day, of the Ontario Agricultural College, explains the relation of foods to animal increase, which every feeder in Canada should carefully study. No one grain is a perfect food for hogs. Seek to get an economical combination that will be rightly balanced for flesh, fat and heat (or energy) production. Barring peas in Manitoba and the Northwest, and some other sections, where "the bug" is troublesome, we grow all the leading grains to perfection, including the hard flint corn. Corn, however, is carbonaceous, largely fat and heat producing, so in feeding the bacon pig it must be used in limited quantities along with such food as shorts, oats, peas, wheat and barley. It is thought by some that the western dent corns are not equal to the hard Canada corn for fine quality of product. A bad general system of pig management may be responsible for some defects attributed to certain foods. Barley is one of our best "all-round" pig feeds, and for bacon is regarded most favorably in Great Britain and Denmark. Ground peas alone make too heavy and compact a food, but a favorite way with many is to feed them soaked, whole, especially to young pigs. Beans, though not unlike peas, according to analysis, are regarded in great disfavor, as producing pork dark in color and of soft, inferior quality. In one or two limited districts where grown extensively, owing to depressed prices the lower grades, especially, have been utilized in hog feeding.

Building a Stave Silo.

ED. HOARD'S DAIRYMAN:—This is my plan in regard to the construction: Commence six feet below the surface with stone and cement; finish one foot above the surface; then commence with 2 x 4 scantling, placed in center of wall, scantling of dressed matched pine, 20 feet long, placed flatwise instead of edgewise, with each lap well pitched. Hoops from top to bottom 2 feet 6 inches apart, bottom hoop 4 inches; strap iron; the rest 2½ inches, with lug bolt, right and left screw to tighten; round shingles, roof entrance, outside, at top; inside, or in the barn, through small doors, between hoops, say 5 or 6 feet apart. To be built without lining, with three coats of paint on outside. Silo to be built at end of barn.

If this pattern will not make a substantial silo, please state through the columns of the DAIRYMAN why not. HIRAM GREEN.

Mercer Co., Ohio.

We see no reason why the above plan would not be perfectly successful.

MARRIED HAPPINESS

is dependent upon the health of the wife more than on any other one thing. If a woman is troubled in a distinctly feminine way the most delicate nerves of her body are in a state of chronic irritation. She has headache and backache. She is listless and spiritless. She is cross and blue. She feels that life is not worth living and her temper reflects the condition of her nerves. Poor, suffering wife—poor, distracted husband. If the husband is a cheerful, good-humored man he will sympathize—if he is nervous, tired and irritable himself, he will probably go off to the club or seek elsewhere more congenial company.

A sick woman is to be pitied because she is miserable and because she has not yet learned that Dr. Pierce's Favorite Prescription will make her well.

The "Favorite Prescription" was developed over thirty years ago in the regular practice of Dr. R. V. Pierce who is and was then, chief consulting physician to the Invalids' Hotel and Surgical Institute, at Buffalo, N. Y. Since then it has been used by millions of women and has brought health, happiness and contentment to as many homes.

"My wife was sick for over eight years," writes Albert H. Fulbe, Esq., of Altamont, Grundy Co., Tenn. "She had uterine disease and was treated by two physicians and got no relief. At last I read about Dr. Pierce's Favorite Prescription. I sent to the drug store, got one bottle and the first dose gave ease and sleep. She had not slept any for three nights. Being sure that it would cure her I sent for five more bottles and when she had taken the sixth bottle she was sound and well. We now have a fine boy at our house."

The "Favorite Prescription" contains no alcohol and no opium or other narcotic, and is perfectly harmless in any condition of the system.

HENS LAY double the eggs when fed on Green Cut Bone.
MANN'S NEW BONE CUTTERS prepare bone in the best and cheapest way. Cut fast, fine, turn easy. Mann's Clover Cutters, newest, fastest, $8. & $10. Mann's Swinging Feed Tray and Granite Crystal Grit make the business profitable. Catalog free. F. W. MANN CO., Box 18, Milford, Mass.

SUCCESSFUL INCUBATORS.
Hot Air or Hot Water.

A standard machine for hatching strong, healthy chicks—self-regulating, patent egg turning trays, drying room under trays, non-explosive lamp—these are a few of its good points. Our 148 p catalogue gives prices and description, also pointers on poultry buildings, etc., mailed for 6c stamps. Write for it now.
DES MOINES INCUBATOR CO., Box 424 Des Moines, Iowa.

BOOM BUSINESS!

Don't be satisfied with poor results. You can hatch thousands of chickens with the
PRAIRIE STATE INCUBATOR
without a possibility of failure. That is best attested by its 200 first premiums in all kinds of competitions with all kinds of machines. Get our 168-page catalogue with supplement.

Can a Cow Reason?

ED. HOARD'S DAIRYMAN:—Some people say that cows do not think, but we had one that did. Her name was Greyhound. She was one of those cows that always tended to her own business and never gave anyone any trouble, until one night when we were tying up the cows, she would not go into the barn, but ran around it and started off down in the field. One of the men followed her and she went straight to a mire hole where a cow was in and could not get out. As soon as she found out the man saw the cow she turned and went to the barn and took her place as usual. If that is not thinking and reasoning I don't know what is. C. S.

Monroe, Wash.

CONCERNING OUR ADVERTISERS.

All readers of the DAIRYMAN who will, this season, purchase a small boiler and engine, should send for the new catalogue of the Rochester Machine Tool Works, Rochester, N. Y., who manufacture the well known "Acme" engine. It is one of the best on the market for the dairy farmer.

THE following from J. E. Keith & Co., Chicago, Ill.:

"We received a copy of your paper and are glad to say that we feel pleased to have an ad. with you once more and hope that our future experience with it will be as satisfactory as the past, for we can truly say that our advertisement in your paper brought us more business, than any other paper we ever used, and a good class of customers."

The above speaks well for the "DAIRYMAN" and we can also say of J. E. Keith & Co. that they are responsible, wide-awake, hard workers, and up-to-date in their business methods.

FOR harrowing sod ground the "Acme Pulverizing Harrow" comes in good, because it does not tear the sods up, and yet chops and pulverizes the soil, until it is as mellow as an ash heap. It will be sent on trial, to be returned at the manufacturer's expense if not satisfactory.

A NEW CALENDER FREE.

John Bauscher, Jr., Freeport, Ill., has our thanks for the finest calendar of the season. It is surely a work of art and would ornament the walls of any poultry raiser. This fine calendar will be sent to any of our readers who mention HOARD'S DAIRYMAN and enclose a two cent stamp for postage. You will not regret it. He also sends out his large 84 page Poultry Book for 15c post paid.

ADVANTAGES OF DIRECT BUYING.

New innovations do not, as a rule, meet with prompt public approval. While the American people are famous all around the world for their business acumen and general aptitude to think out and bring into action new inventions and new methods, we often show a disposition of positive lethargy when it comes to changing so-called fixed principles and methods.

Certain manufacturing institutions have in recent years inaugurated a new system of disposing of their products, which is unqualifiedly to the advantage of the consumer. It took courage to make the change, but they did it Among the pioneers in this new method of doing business was the Elkhart Carriage and Harness Mfg. Co., of Elkhart, Indiana, whose ad appears on another page. These people began this plan of doing business twenty-six years ago and have adhered to it strictly ever since. The result has been so entirely successful that they are to-day the largest manufacturers of carriages and harness in the world, selling to the consumer exclusively.

In dealing with the Elkhart people there is no risk to assume, as they ship either vehicles or Harness anywhere for examination and guarantee every article they manufacture and sell. Then, too, one may deal satisfactorily from any distance. The Elkhart Carriage & Harness Mfg. Co. publish an extended illustrated catalogue, which they will take pleasure in mailing to all our readers who request it.

REMOVED TUMOR, ALSO CURED FISTULA.

COMO, HENRY Co., Tenn., April 9, 1898.

THE LAWRENCE WILLIAMS Co., Cleveland, O.

Replying to yours of 5th inst., in regard to the tumor I removed from back of my hand, will say that it had been growing for two or three years. I had shown it to two doctors and they both led me to believe it might be cancer. I began using the Caustic Balsam, by applying it once or twice per day, with my finger; did not rub it to create any friction. I kept this up for two or three weeks when it became loose and I took hold of it with my fingers and pulled it out by the roots. It left quite a hole, but it has healed, and there is no scar or anything by which you can tell it was ever there. I also cured a fistula on a fine mare with three applications. H. H. LOVELACE.

RUN OVER BY A STEAM ENGINE.

GRANADA, Minn., Jan. 2, 1899.

PAGE FENCE Co, Adrian, Mich.

DEAR SIRS—During the past year I have put up seven miles and eighty rods of your different styles of Page Fence on my farm, and all are giving entire satisfaction.

Last year while we were threshing we gave your 13 bar 58 inch fence a good test We weighted the fence and pressed it to the ground and then drove the steam thresher over it, but when the weight was removed it came to its place and stood as erect as ever, and no one could have seen where we drove over it. Yours truly

F. L. PARK.

The flavor of butter is of prime importance to the creameryman. In order to obtain it neatness and cleanliness are necessary qualities which should be drilled into the operator at every stage of the process. Machinery should be furnished him that can be kept clean and neat. "Any old thing" will not do in the creamery or dairy Haney-Campbell Co., of Dubuque, Iowa, are putting out vats now that for beauty of finish are hard to be equalled. Instead of being painted, they are finished so as to show the natural grain of the wood. Inside they are built in the same substantial manner that is so well known to all users of the Haney-Campbell goods. When fitted with these the creamery looks almost as neat as a drawing room. They cost little more than the other vats, are as easily kept clean, and give a tone to the establishment that is imparted to the butter sent therefrom.

UNTIL the last week or so, there has been running in the DAIRYMAN an advertisement from the Standard Paint Co., of 81-83 John St., New York City, and we trust many of our readers have availed themselves of the opportunity of securing a sample of the Ruberoid Roofing, which they are the manufacturers of.

There is a great deal that could be said for this roofing and it recommends itself to the farmer, combining efficiency with economy. It is made from the best and strongest of felt, no paper whatever being used. They do not contain tar or asphalt, to run or melt with heat, and is absolutely water proof and vermin proof. It renders an excellent service in barns, poultry houses, stables, etc., and is extensively used as a siding This company are also manufacturers of the extensively used P. & B. Preservative Paint. This paint is not affected by acids, alkalies, moisture or stable gasses, and merits a very liberal use by dairymen and farmers generally.

VETERINARY.

Queries in this department answered by WM HORNE, M. D. V. S., Janesville, Wis.

COW PHYSIC—Three-fourths to 1¼ pounds Epsom Salts (according to age and size of animals) and two ounces of best ground ginger. Pour over this three pints of boiling water. When at 105° F., give gradually as one dose.

POOR FLOW OF MILK.

A young cow calves without any trouble, cleans nicely, eats well, and seems perfectly healthy in every respect and yet gives no more than a pint of milk twice a day. Ordinarily she is a very fine milker. What is the cause, and what the remedy? T. F.

Victoria, B. C.

ANSWER.

There is no accounting for the freaks with the milking of a cow. I know of nothing to do but feed milk-producing food. Nutritious, sloppy, warm food and one massage daily. Good exercise and sunlight, etc., is all I can recommend that is rational.

BITTER MILK.

One of my neighbors has a fine Jersey cow but about a week ago she began to give bitter milk, so bitter that they cannot use it.

Alplaus, N. Y. W. D.

ANSWER.

The cause is undoubtedly in the food. Give full and immediate dose of physic and look to the food and remove the cause. The physic will more than likely remove the bitterness but the same cause will be likely to give the same result. The cause must be removed to affect a cure.

POOR APPETITE—FAILURE TO BREED—EATING THE AFTER BIRTH.

1. I have had several cows act strangely this winter. At first they would refuse to eat and would tremble as if cold, shrink on their milk until they gave nothing to speak of and then they would gradually come back to their appetite and their milk and would be all right, the whole thing lasting about a week or ten days.

2. Some of my cows have been served by bull from two to seven times and have not caught yet. I have been to four different bulls and the cows range in age from 3 years to ten years old.

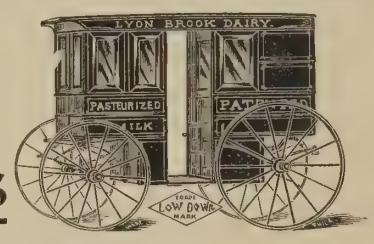
3. Is it necessary for a cow to eat the afterbirth when she calves? F. H. L.

Hampshire Co., Mass.

ANSWER.

1. I would judge the cause to be the extreme cold. When I lived upon the Illinois prairie, in '51, I had 500 sheep all in the condition you name. My horses and cattle tumbled about and gave but a scant flow of

Michigan in Line As Usual.



At the Michigan State Dairy Convention, held at Grand Rapids, Mich., February 1, 2 and 3, 1899, H. A. Shellenberger, of Chesterfield, Mich., and J. F. Phillips, of Flint, Mich., tied for Grand Sweepstakes on a score of 95. Both used **Wells, Richardson & Co.'s Improved Butter Color,** as did over 95 per cent of all exhibitors at this successful convention.

milk. 1851-2 was the coldest winter in the history of Chicago.

2. You are making bad worse each time you bull a nymphomanac subject. You need a sure antiphrodisiac, e. i. deadener of sexual desire. Give four drams of black haw and one dram of false unicorn, each mornings for three mornings, rest two days, then repeat, then one dose every three days up to four doses. Your best plan is to select a remedy from the DAIRYMAM.

3. No.

POOR FLOW OF MILK.

I have a Jersey cow which has dropped a calf between 1st and 10th of December. She was due some time in January She did not get rid of the afterbirth as she should have, so took it from her after twenty-four hours. She has never milked as she should have, although her appetite has been good most of the time. Her hair looks all right and it seems to me that she should be doing well. She is being fed 3 lbs. cotton seed meal, 6 lbs. wheat bran, 6 lbs. cotton seed hulls, and good, bright sorghum hay, daily, two feeds.

I have another cow in the same condition. Has been in milk since September. Have tried everything but cannot bring her to her usual flow. I am now getting from six to eight pounds at each milking from each of them. The first cow mentioned milked for me, with the calf before, from twenty-eight to thirty-two pounds daily.

Texas. D. M. BATES.

ANSWER.

I know of nothing to do but to feed sloppy, nutritious food and use continuous massage for quite a while. Milk closely and well at each milking. This will be more than likely to help the two cows to increase of milk.

GARGET.

My cows get sore in the end of one of their teats and soon the quarter swells, milk gets thick and soon the quarter is ruined. Others will swell in the quarter before anything is wrong with the teat. Cows stand on floor and are stanchioned nights. Plenty of hay, consisting of wild hay, millet and alfalfa; no grain except what they get on stalk fields, as they are out day time. Two years ago they did the same way, but we fed heavy of meal, and laid it to the meal. J. E. G.

Albion, Neb.

ANSWER.

Immediate full dose of physic and repeat in four days; then if needed repeat the third time. Cleanse end of the teat with hottish water and castile soap; then keep soft with the following ointment: oil of almond and spermaceti ointment, equal parts, and two drams of aloes, to be thoroughly mixed and the end of the teats to be kept well annointed for a while. Don't forget the physic.

SMUT POISONING.

Our calves are dropped apparently strong and all right in every way, but when 12 to 48 hours old they begin hanging their heads, necks become stiff, and gradually grow stiff all over. Their muscles twitch, some have sharp pains. Some show signs of scours (not bad) others do not. Some live to be three weeks old but are stiff, and all die.

Portland, N. Y. SUBSCRIBER.

ANSWER.

Looks to me like smut poisoning, caused by smut in the mother, obtained in some form of the food. All the symptoms indicate clearly, poisoned by smut; this can be found in the corn and stalks, in the bran and largely in the second growth clover and in other kinds of food, to be quite sufficient to affect the calf in embryo, or even after.

I would advise you to have a competent person look into cause and act accordingly. This is the nearest I can approach a diagnosis

THE LAWRENCE-WILLIAMS CO., Cleveland O.

Thousands Have Kidney Trouble and Don't Know It.

There is a disease prevailing in this country most dangerous because so deceptive. Many sudden deaths are caused by it,—heart disease, pneumonia, heart failure or apoplexy are often the result of kidney disease. If kidney trouble is allowed to advance the kidney poison in the blood is liable to attack the vital organs, or the kidneys themselves break down and waste away cell by cell. Then the richness of the blood—the albumen—leaks out and the sufferer has Bright's Disease, the worst form of kidney trouble. Kidney trouble can be detected although it be slow and deceptive. First, by analysis of the urine; second, by the simple test of setting the urine aside in a glass or bottle for twenty-four hours, when a cloudy or brick-dust settling indicates it.

It was for just such troubles that in His infinite power and goodness the Great Physician caused Swamp-Root to grow for the benefit of suffering mankind, leaving it for Dr. Kilmer, the great kidney and bladder specialist to discover it and make it known to the world. Its wonderful efficacy in promptly curing the most distressing cases is truly marvelous.

By sending your address to Dr. Kilmer & Co., Binghamton, N. Y., you may have a sample bottle of Swamp-Root, the great kidney, liver and bladder remedy, and a book that tells more about it, both sent absolutely free by mail.

When writing be sure and mention reading this liberal offer in HOARD'S DAIRYMAN. The regular fifty-cent and one-dollar sizes are sold by most druggists. Make a note of the name, SWAMP-ROOT, Dr. Kilmer's Swamp-Root, and remember it is prepared only by Dr Kilmer & Co., Binghamton, N. Y.

Philadelphia Milk.

ED. HOARD'S DAIRYMAN:—I have just read the 'Notes and Comments" of Mr. John Gould, wherein he states that all the milk bought by Mr. Geo. Abbott must not be less than 4½%. I think that if Mr. Gould would visit one of Mr. Abbott's light lunch places and call for a glass of milk, he would do the same as I did, ask the waiter to give him the next glass half cream, which seemed about the sort of milk that would suit every man that was used to drinking milk from his own dairy, where 6½ quarts milk make a pound of butter.

I also note that Mr. Gould is ready to boom Messrs. Sharpless, Darlington & Abbott, and such men that to an extent monopolize the prices of the producer. I would further say that if all the milk Mr. Abbott receives will test 4.5%, he is not willing to pay the price that would warrant a man to ship such milk. W. H. W.

Feasterville, Pa.

The Milk Business in Philadelphia.

The annual report of W. J. Byrnes, inspector of milk for the Philadelphia Board of Health, throws a strong light on the subject, and is valuable as a basis for future judgment on the question of the value of a thorough system of city milk inspection. As the DAIRYMAN has repeatedly said, every intelligent effort to stop adulteration and cheating in milk, cannot but be in the interest of every honest farmer who produces milk for city use.

In his report Inspector Brynes says:

"The effect of diligent inspection is apparent in the reduced percentage of adulterated milk from year to year, as follows: 1892, 11.15 per cent.; 1893, 6 per cent.; 1894, 3.82 per cent.; 1895, 4.29 per cent.; 1896, 3.81 per cent.; 1897, 2.38 per cent.; 1898, 1.78 per cent. It will be seen that a gradual decrease in the percentage of adulteration has attended unremitting and methodical inspection.

Added water as a requisite for the 'better keeping' of milk has ceased to be an accepted dictum of the farmer. The time honored method of cooling milk by the addition of water has been superseded by safer methods. Discarding the rinsings has likewise been found the wiser course to avoid the charge of adulteration. A more liberal treatment of the cows is also found to be necessary to enable the farmer to furnish a fair average milk.

Recent analyses of the milk found in the wagons and shops of dealers show the average to be 13.09 per cent total solids, 4.05 per cent. of fat and 9.04 per cent solids not fat.

This is the quality of milk the consumer pays for and is entitled to get and is getting. An attempt to lower or depreciate the quality of the supply as found by the analysis should be resisted to the utmost. It is more than likely that a bill of this character will be presented at the present session of the legislature to legalize the production of an inferior milk which will relieve the farmer from the burden of feed bills.

He vehemently declares that the price received from the dealer, or middleman, is not sufficiently remunerative to justify the feeding necessary to produce other than inferior milk. But reduction in quantity does not mean reduction in price; at least to the consumer. It is to be hoped that the rights of the latter will receive some consideration from our lawmakers at Harrisburg.

Mr. Byrnes calls attention to substitutes for chemicals formerly used, which were employed by dealers to prevent the souring of milk, and to reduce the expense of ice bills. In thirty-four prosecutions for so violating the law seventeen defendants pleaded guilty. Two were convicted, and one, a farmer, was acquitted, two discharged with a warning and twenty-one cases are still pending. Prompt disposal of milk cases is prevented, the Inspector states, by the priority given to prison and urgent criminal cases.

In closing, the report calls attention to the necessity of better legislation in the interest of pure milk.

ILLUSTRATION.

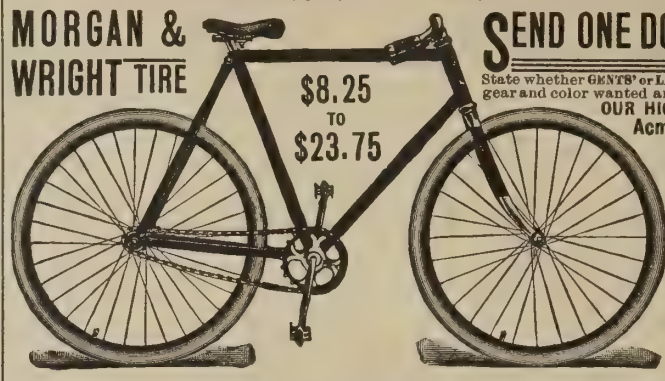
We feel sure that every regular reader of HOARD'S DAIRYMAN has seen the advertisements of the Hallock weeders, and we know that hundreds of them have already ordered a weeder for the coming spring; but reader, have you done so? If not, you will have reason to regret it from the first day fit to stir the soil until your crops are "laid by," but you will not realize your loss as would the man who has once used these weeders and is then deprived of it.

We know personally many farmers who used these weeders last year and regret that lack of space prevents us from reproducing some of the many letters we have seen commending them. Here is a sample letter:

DIME, ARMSTRONG CO., PA., Feb. 17, 1898.

Messrs. D. Y. HALLOCK & SONS, York, Pa.—DEAR SIRS:—I bought a weeder from you last season which gave the best satisfaction of any tool I ever used. I worked a ten acre field of corn with it into which I never put another tool, and it was the cleanest field of corn I ever raised. Everyone was astonished at the work I could do with that weeder. Several of my neighbors will buy them the coming season. Send me agents' terms, I think I can sell some for you.

Yours truly, J. J. REARICK.



If you have not done so, write to-day to D. Y. Hallock & Sons, Box 812, York, Pa.

O. DOUGLASS BUTTER CULTURE.

ST. GEORGE, MINN., Feb. 20, '99. O. Douglass Butter Culture Co., 81 Austin St., Charlestown, Mass. Dear Sirs:—In the Genesee Salt contest I scored 97½; at the State Fair, Minnesota, I scored 95½; at Sioux Falls Convention I scored 95; being a money winner at each. I used your culture in all of the above. C. H. CLEVELAND, St. George, Minn.

O. DOUGLASS BUTTER CULTURE CO., 81 Austin St., Charlestown, Mass.

QUAKER DAIRY FEED

Modern Dairy Feeding

This interesting little book is written for the practical dairyman. It covers the subject of milk production in the light of the best and most recent thought, and is the most valuable book on the subject ever published. A practical dairyman himself, the author handles his subject with due regard to the actual value of his material in practice, and his findings can be confidently accepted as safe working guides. The book is free. Send for it.

Quaker Dairy Feed

Quaker Dairy Feed is made entirely of grain—principally of oats—combined in scientific proportions. It is complete for the production of milk and the proper maintenance of the animal.

Sold only in Sealed and Branded Sacks

SPECIMEN BALANCED RATION

Timothy Hay, -	12 pounds	Gluten Meal, - -	3 pounds
Malt Sprouts, -	3 pounds	Quaker Dairy Feed,	8 pounds

Calculated for a cow of 1,000 pounds live weight.

OUR FEED EXPERT.—We wish to come as close to the consumer as possible, and freely offer the personal services of our Feed Expert in assisting in the solution of feeding problems. While our **"Modern Dairy Feeding,"** which we will send postpaid on request, covers the ground as thoroughly as possible, farm conditions vary so greatly that special information will often be of immense value. Our facilities for giving such information are the best, and we gladly invite your correspondence. Address

Don't buy until you get our free POWER CATALOGUE.

Smalley Mfg. Co. Box 16, Manitowoc, Wis.

ROUND OR FLAT FINGERS. Which are Best?

NO GOOD JUDGE decides a case until BOTH sides have been heard. Neither should YOU. Read and BELIEVE all that other manufacturers say of the value of a GOOD weeder in the field, but before buying ANY weeder see what WE have to say about

BREED'S new "VICTOR" WEEDER with ROUND FINGERS,

then decide in favor of the one you think is best AND BUY IT.

Twelve years of PERFECT success with ROUND FINGERS enables us to

GUARANTEE that our "Victor" Weeder will do BETTER work in ALL crops and EVERY spot and place than any other shape or make, and that they will do GOOD work where others will not work at all. When one does not do so it may be returned and we will refund the entire cost to you.

☞Agents wanted everywhere. First Weeder in a town at special price, and you have the agency if you want it. Write TO-DAY for our circulars. THEY MAY SAVE YOU DOLLARS.

THE Z BREED WEEDER CO.,

265 Merchants Row, - - BOSTON, MASS.

THE FAMOUS KEYSTONE LINE OF SEEDING, PLANTING AND CULTIVATING TOOLS.

Victor Disc Harrow —greatly improved for '99. Oil tubes to the bearings from top of frame—positively exclude all dust or dirt. Steel scrapers, double adjustment levers—easy to place gangs at any angle. Ball bearing—no side pressure and easy draft. Made 4, 5, 6, 7 and 8 ft. wide, with 18 or 20 in. discs. SEEDER ATTACHMENTS are made for 6, 7 and 8 ft. disc harrows.

Keystone Force Feed Broadcast Seeder are made 8½ or 11 ft. wide. Sows broadcast all small grains in any quantity in the best possible manner. Mounted on low steel wheels. Made with or without grass seed attachment. Equipped with CULTIVATOR ATTACHMENT if ordered. Made with end wheels or middle wheels. Has the best force feed we know. Send for special Seed Circulars.

Keystone Rotary Drop Corn Planter —it's a whole hill drop, each hole in seed plate holds enough grain for a hill. It never skips or misses. Equipped with Automatic Wire Reel. Has a drill attachment. Gear throws out automatically at end of row. Always drops at even depth because of the shoe gage on each runner.

Keystone Potato Planter —sprung quickly into popular favor because it is a simple and effective machine for the purpose at a reasonable price. Fits the needs of the man who grows an acre or two of potatoes, but who is not regularly in the business. Plants 10, 14, 17 or 20 inches apart in rows. Send for circulars.

Keystone Walking Cultivator. This is clearly a leader among the machines of its class. It is made entirely of steel and iron except tongue, singletrees and neck yoke. Strong and well braced in every way. Steel braces and four soft center steel shovels. Full line of Riding Cultivators also. Send for circulars.

KEYSTONE MANUFACTURING CO., 39 RIVER STREET, STERLING, ILLINOIS.

TOWERS' SURFACE CULTIVATORS

BOTH RIDING AND WALKING, A COMPLETE SUCCESS.

J. D. TOWER & BRO.:—"We have given your Surface Cultivator a thorough trial the past season, and we have been highly pleased with the result, not only as regards the superior condition in which it left the soil for conservation of moisture, but as to the way in which it handled weeds. The stiff stemmed milk weeds, iron weeds, had to go. The destruction of the small weeds, such as foxtail, was complete. J. J. Edgerton, Farm Foreman Iowa Agricultural College, 1898."

☞Send for Treatise on Corn Culture, and discount to **introduce** where we have no agent. **J. D. TOWER & BRO., 4th Street, Mendota, Ill.**

Be Fair with Your Fields

and they will be fair with you..... Listen a moment.

Every time you take a crop off a field you relieve it of just so much fertility. You should do something to restore that fertility. Barn yard manure is the best fertility restorative known if properly handled and properly applied. Even a small amount can be made to go a long way and accomplish great good if finely and evenly spread. This cannot be successfully done by hand—it is work for a perfected machine. The only machine known which accomplishes this is

The KEMP MANURE SPREADER.

It will Double and Treble the Value of the Manure Heap.

It spreads all kinds of **fine and coarse manure evenly;** it makes no "skips;" does not dump a great load in one spot, but covers the entire ground evenly. Tears up coarse and lumpy manure and makes it fine. Better than anybody can do it by hand. **Spreads lime, wood ashes, salt, etc.,** equally well. With the drill attachment **it puts the manure direct into the open drill.** Made in three convenient sizes. Ask the opinion of anybody that uses one. **Write for illustrated catalogue.**

Kemp & Burpee Mfg. Co., Box 46, Syracuse, N. Y.

THE MOST FOR THE MONEY.

THE MOST POWER for the money can be gotten from our 2, 3 and 4-horse

TREAD POWERS

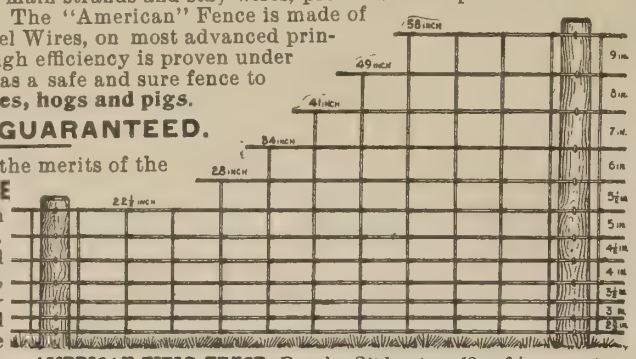
because safest for dairy machinery, cutting, shelling, grinding, sawing, pumping, etc. Get our circulars and know all about them.

ST. ALBANS FOUNDRY CO., St. Albans, Vt.

GROUND FEED

is the best feed for all animals because it is more easily digested than whole grain. Then, too, there is no loss in feeding it. With a fast grinder like the

Kelly Duplex



it can be ground daily, being always fresh, or ground in quantity as desired. **This is the only really fast Grinder made** requiring small power. Don't buy a grinder until you get our **free** catalogue **No. 16.**

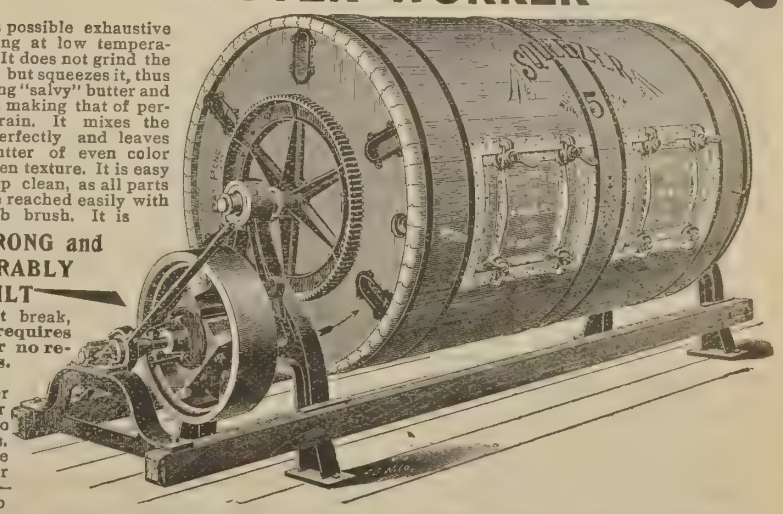
P. M. SHARPLES, West Chester, Pa.



The "SQUEEZER"

COMBINED CHURN and BUTTER WORKER

Makes possible exhaustive churning at low temperature. It does not grind the butter, but squeezes it, thus avoiding "salvy" butter and always making that of perfect grain. It mixes the salt perfectly and leaves the butter of even color and even texture. It is easy to keep clean, as all parts may be reached easily with a scrub brush. It is

STRONG and DURABLY BUILT

will not break, and requires few or no repairs. Five sizes for creameries, 300 to 700 gals. Three sizes for dairies—50 to 150 gallons.

Save Money and Labor by Buying

THE IMPROVED U. S.

TRIPLE CURRENT SEPARATOR

Users say it is **unequalled** for **clean skimming,** durability and ease of operation. They surely ought to know. Read a few of their letters :

The More Used the Better Liked.

RIDGEWAY, WIS., Jan. 9, 1899.
The more we use the Improved U. S. Separator the better we like it. It is as **reliable as a good clock,** and it seems to me that it will be **as durable.** It runs light, does good work, is easy to take care of, and made to last.
THOS. CONVEY, Conductor of Farmer's Institutes.

Takes Out Every Particle of Cream.

SILVINA, WASH., Jan. 2, 1899.
The No. 5 Improved U. S. Separator is all right. It is easy to turn, easy to clean, and takes out every particle of cream. We make considerable more butter and receive 2½ cents per pound more for it. It is the best machine a farmer ever bought. MAX BARTL.

Greatest Labor-Saving Machine.

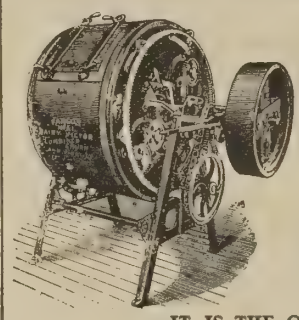
TURIN, N. Y., Jan. 11, 1899.
The No. 5 Improved U. S. Separator works finely. It is the greatest labor-saving machine for making butter that was ever made. **We could not do without it.** Every farmer should have one. J. BIBBINS.

Remember that in order to have the best, the **TRIPLE CURRENT SEPARATOR,** you must buy the **IMPROVED UNITED STATES.**

Illustrated circulars free on application.

VERMONT FARM MACHINE CO., Bellows Falls, Vt.

There's More Money

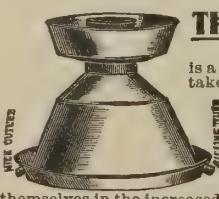


in milk than you can get out of it by the old way of skimming. If you had a Victoria Separator you would get *all* the cream—and a better quality of cream—from the milk, in much less time, with much less work than by any other way. It will pay any one who makes butter or sells cream, to write for illustrated, descriptive circular of the

VICTORIA CREAM SEPARATOR

Made in hand and power sizes, adapted to the needs of the smallest as well as the largest dairies. The Victoria Hand-power Separator is as practical, as durable and skims as close as the largest separator made. **Agents wanted.** Write for catalog of dairy appliances—milk coolers, strainers, milk scales, butter tools, etc.

THE DAIRYMEN'S SUPPLY CO., 1937 Market St., Philadelphia, Pa.



THE DAIRY "VICTOR" Churn.

This Combined Churn and Butter Worker is proving itself to be precisely what the farmers and dairymen have been seeking after. It's work is as complete as the work of the "Factory" Victor Churn, which is rapidly supplanting every other Combined Churn and Butter Worker.

IT IS THE ONLY SUCCESSFUL DAIRY COMBINED CHURN AND BUTTER WORKER ON THE MARKET.

It is easy to handle, easy to clean, perfect in its work, durable and reliable. It charm every farmer and dairyman who sees it work. Manufactured by . . .

F. B. FARGO & CO., Lake Mills, Wis.

THIS PERFECTION MILK COOLER AND AERATOR

is a simple device for cooling and aerating milk. It quickly and effectually takes out all animal heat, and with it all **animal odors, odors** arising from **stables, feed, etc.** This method of treatment makes the milk keep sweet much longer. It is better for making **butter, cheese,** etc., and will stand shipment much better.

Cost But Little and Last Indefinitely.

They are made in sizes from 1 to 200 cows and will quickly pay for themselves in the increased reputation they give your product. They come very nearly taking the place of ice in warm weather. Send for illustrated catalogue and prices of **Farm and Dairy Supplies.**

Reading notices, 50 cents per line (nonpariel measure), each insertion.

A GOOD MOVE.

We learn from correspondence in the Wisconsin State Journal, that all the Swiss and Limburger cheese factories in the vicinity of Mt. Vernon, Wis., will open the season, this year, with the practice of receiving all milk according to the Babcock test, and divide receipts by the percentage of fat. The same item says all the patrons will make an effort to improve their cows. A large number of Cheddar factories in this state will adopt the same plan the coming season. This is encouraging.

HOW SUCCESSFUL DAIRYMEN PRODUCE GOOD COWS.

Here is the advice, and the record that lies back of the advice, of John Armstrong of De Smet. S. D., which he gave before the South Dakota Dairy Convention:

"Do not fail to use the best dairy bull within reach. I am now using one out of a young cow that made twelve pounds of butter per week with first calf. Her dam made 20 lbs., grandam 17 lbs. 4 oz., and great grandams, 19 lbs. in 7 days. This bull's sire's dam, two grandams, and four great grandams have a seven day average of 19 lbs., 10½oz. We expect something good from him.

"In January I delivered to the creamery 8,466 lbs. of 4.8 per cent milk from ten cows and two heifers, which will bring about $75; the skim milk is worth $7 to feed to calves and pigs, making a total for the month of $82. Deduct from this for feed $21 and we have a net gain of $61.

Mr. Armstrong simply accepts the fact that if the dairy farmer wants cows that will pay to work with he must become his own breeder. And if he becomes his own breeder he must study out the *principles* of sound dairy breeding and be governed by them. He must not follow out mere notions or desires, but follow out principles.

Grade Cows for the Dairyman.

Ed. Hoard's Dairyman:—I have been much interested in the Dairyman for several years, and not a few, but many good things have I found in it. I have recently been much interested in the pictures of noted dairy cows, which have, from time to time, appeared in its columns, all of which have been pure bred animals. Sometimes I have thought, that were it possible for you to get them, the pictures of cows known as grades might interest a class of farmers, who have not the means to own a phenomenal cow of any of the registered dairy breeds, with a pedigree of great length. I have sometimes wondered if the presenting of the pictures of some noted animals did not have the effect of discouraging some farmers, who, with faint heart, were encouraged in the belief if they could not own a world beater, there was no use of their trying to breed anything better than what they at present owned, and so kept on year after year, with their scrub animals.

Now, as a matter of fact, I believe there are many cross-bred, or grade cows of some of the dairy breeds, that if they were brought out, and fed and cared for, along lines that have developed some phenomenal cows, that would, for practical purposes, be found but little inferior to the pedigreed animals. Do not understand me as saying anything belittling pure bred animals. For it is to them that every grade owes what merit it posesses. But I speak of it for the sole purpose of encouraging men of small means, to make the best of their present condition, and grade up by using bulls of pure blood and high in merit.

In order to show the force of my argument, I send you a picture of two cows, neither of them pure bred, yet some pure blood flows through their veins. They are not phenomenal cows, but cows of good dairy quality, cows that pay to keep, even with low price butter, cows such as any farmer can own if he will. That is all I claim for them.

The one on the left of the holder, as he stands facing us, was born in March, 1882, making her 17 years of age nearly. She is a cross-bred Ayrshire and Jersey, her mother an Ayrshire, her sire a pure bred unregistered Jersey. She dropped her first calf, which is at the right of the holder, at twenty-three months of age, and has been milked continuously ever since. She has never been milked without a feed of grain of some kind (thus showing that grain feeding has not worn one cow out, as many predict it will). She has produced a calf annually and it has been strong and of fair size. She calved on Feb. 6th and was being milked once per day, and was given 8 pounds of mixed corn and oat chop, with an equal quantity of wheat bran and a little linseed oil meal. She produces annually, on an average, 6,200 pounds of milk, testing shortly after calving 4 6% butter fat; six months after calving she tests 5.4% butter fat and later as high as 6%. Her companion in the picture is now 15 years old; was sired by a pure bred Ayrshire bull, making her a three-fourths bred Ayrshire cow. She is owned by my hired man, Robert Dodgson, of Logan, N. Y., and is his only cow. His family consists of himself, a wife and one son. In one year's time she has produced a calf which was fatted upon her milk for veal, furnished the family with milk for family use, and also the butter used in the family, and there was sold from her 195½ pounds of butter, no account having been made of the total amount she made, nor the milk used by the family. I will say they use milk and butter both in the family and don't stint themselves either. She is also fed grain feed summer and winter, and is now giving 12 pounds of milk daily, and is due to calve March 15th. These cows, as before stated, I do not consider anything wonderful at all. They are simply dairy bred, yet not pure bred. They have a dairy form and a dairy function, and when fed so as to enable them to do what they are bred for, can do it and are doing it. That is all there is about it in a nutshell. Any farmer in the land can, if he will, by the use of a pure bred bull of merit, produce a whole herd, of just as good ones, and when he has them, his dairying will pay some per cent of profit even with ten cent butter.

Barns for Alfalfa Hay.

Ed. Hoard's Dairyman:—Most of the readers of the Dairyman are so situated that there is no question with them whether they shall put their hay in a barn or stack it outdoors. They know by experience that the losses by rain in summer and snow in winter, will much more than equal the cost of the barn. But the Dairyman has a large constituency living in the arid west to whom the problem is not so easy and certain of solution.

An experiment was lately made at the Colorado Agricultural College, to determine the difference in loss between the barn and the stack. Our first cutting of alfalfa is cut during our rainy season and is often much injured in the stack, so that our cows refuse a good deal of the coarser parts. The second and third cutting are less likely to suffer and the third cutting makes the finest dairy feed in the world. In our experiment the first cutting of a field of alfalfa was divided, two loads put in the stack, the next two in the barn, and so on through the field. Everything was carefully weighed and sampled when put in and the same weights and samples taken when the hay was fed out in February.

The hay in the stack was in four layers. The top and bottom layers lost sixteen per cent of their feeding value and the middle layers lost eight per cent. The difference is due to the greater amount of fermentation in the hay that is dampened by the rain on top and the moisture absorbed from the ground in the bottom layer.

This stack was well made and had a chance to settle thoroughly before any heavy rains came, so that the above amount of loss represents about as little as ever occurs with the first cutting. As already stated, the loss in the second cutting is less, and for the third cutting the loss is but slight.

The average loss of the hay put in the stack was 12½ per cent. The loss of the other half put in the barn was 2½ per cent. The difference in favor of the barn is just ten per cent, or one-tenth of the hay. This means that nine tons of hay of the first cutting put into a barn will feed as many cows as ten tons of hay put in the stack.

The practical question is: Can one afford to build and use a hay barn for the sake of saving one-tenth of his hay?

The cheapest hay barn will cost about two hundred dollars for a barn large enough to hold forty tons of hay. If the barn is made larger, the proportional cost will be less, but if it is to be built in the field this is about as large as can be made and have the hay put up without much long distance hauling.

Counting interest, repairs and depreciation at ten per cent per year, the cost of the barn is fifty cents per year for each ton of hay it will hold. The amount of labor required to put hay in a barn, as compared with using a stacker, is at least half as much again, while it will take more work to feed the hay from the barn than the stack. It is evident, then, that using a barn costs at least seventy-five cents a ton more than stacking.

Will it save the seventy-five cents? The answer to this depends on the price of hay and the weather during the summer. The amount of loss given above—ten per cent—represents the least probable loss. In 1895 our first cutting put in the stack lost thirty-five per cent of its feeding value.

With hay at two and a half to three dollars per ton, there is little chance for profit in building barns to help preserve it. But when the price reaches six dollars per ton, as it has this winter in most of the dairy districts of Colorado, it is probably a good investment to build barns enough to hold at least the first cutting of alfalfa.

W. W. Cooke.

Colorado Agrl. College.

The Jersey vs. General-Purpose Cows.

Ed. Hoard's Dairyman:—I want to relate an experiment made under my supervision some years ago, which is just as applicable to many farmers to-day as then. It came about in this way. My parents at that time kept three cows, one a Jersey and two general-purpose. All were, practically, in similar lactation periods, and treated exactly alike. Of course, I was a boy then (a period when you are supposed to know less than your seniors,) and when the question was raised about selling the Jersey cow, of course I kicked. She was to be sold simply because she did not give quite as much milk as her partners. Mother was just sure she was the poorer cow, because she—like so many mothers, fathers and even sons at the present day—simply looked at the quantity of milk, and not at the quality. After much persuasion I finally carried my case—i. e. these cows must have a regular (?) court trial.

Oh! but that was a momentous week of waiting. Mother kept the milk and cream of the two general-purpose cows in one vessel, and the Jersey cream alone. Finally the seven days were up and cream ripened, and you can imagine I churned gladly then, and mother worked and salted the butter. Results, Jersey 6 pounds, 1 ounce; two general-purpose, Short-horns, 4 pounds, 8½ ounces merchantable butter, and about one quart of cream for coffee. Understand, it took both to make 4 pounds, 8½ ounces and 1 quart of cream. In my notes, I find the Jersey was fresh the first of November 1891, and the test was made in May 1892 on timothy and nothing but timothy pasture, during the day only. You, no doubt, think the Jersey stayed, and in that you are right. She subsequently died of milk fever.

Now I want to draw an object lesson from this experience. But in order to do so I will be obliged to hold before you the practice of my kind and worthy father, who four years ago kindly turned the reins over to his only child, who now tries to support him by breeding up a herd of Jersey cows.

The object lesson is this: My father bred that Jersey to anything that a neighbor chanced to have, except a Jersey, and, of course, never got results equal to the dam. His error was the too common error of beefiness, etc., larger cows and heavier veals.

Look at that cow's results—giving milk 7 months, and then on nothing but timothy pasture make 6 pounds, 1 ounce of butter. She was a Klondike—a veritable gold mine; a 300-pound rate at the end of 7 months, under such treatment.

If my father would have bred that one cow the way I must myself now breed other ones, I would have a herd of Jersey cattle that no $1,000-bill would tempt me. The way for you and me to do now, is to do what we think they (our fathers) should have done. Do test your property for a gold mine, before you sell your treasure in disguise for a song that has no music. A. Hursh

TO THE MEN WHO DON'T TAKE HOARD'S DAIRYMAN.

Mr. J. Moldenhawer, of Washington, D. C., is a highly skilled dairyman. He is engaged in producing the finest of milk for the highest paying demand. Mr. J. C. Jurgensen, of Brooklyn, N. Y., in writing to us in the issue of Sept. 23, concerning a visit he paid Mr. Moldenhawer, says:

"Mr. Moldenhawer is himself picking out Hoard's Dairyman before any other of the many farm papers he keeps, and he frankly says that your great paper is of high value to him. When a man with his reputation says so, how can the farmers who expect to make money by keeping cows for dairying, get along without the Dairyman. Still it is a very trying job to try to convince farmers how much it would help them to keep an extra good dairy paper."

What is the lesson that the above teaches? This: That no man who is keeping cows for profit can afford NOT to have such a friend and adviser as Hoard's Dairyman at his elbow every day in the year. Simply put a dollar bill in a letter with your name, post office, county and state plainly written on a piece of paper, and mail it to us, and secure the paper to Jan. 1, 1900.

ARE CREAMERIES PROFITABLE?

This is a question which an Iowa paper, the *Maquoketa Record*, undertakes to answer in the affirmative, and in proof of its assertion it brings forward the following record kept by John Roher, as the result of the sales of milk and calves from his dairy of twelve cows, covering a period of nine months. The creamery which takes the milk is co-operative and presumably Mr. Roher is one of its best patrons. Here is the record.

May milk	$ 10 90
June milk	24.51
July milk	25.88
August milk	25.55
September milk	26.45
October milk	31 08
November milk	28.00
December and January milk	22.18
Sale of calves	175.00
Total	$ 369.55

An average of $30.797

We wonder, sometimes, when we see such low records quoted as being profitable, if the farmer who makes them really thinks he is making money? In Wisconsin, and in Iowa also, $30 is just about what it costs to keep a cow for a year.

If this estimate is true in Mr. Roher's case, and we judge it is, he has simply labored the whole year to keep the kind of cows he has, for just what their feed and pasture is worth, balancing the labor with the manure.

We are inclined to think the difficulty lies in the kind of cows he is keeping. It will pay Mr. Roher, as well as a good many other creamery patrons, in Iowa and other states, to look into the question. How much ought a creamery cow to earn, in order to bring a profit?

Then one more question. Does it pay to keep cows for dairy purposes, pay all the expense necessary to such purposes, that are not dairy cows? With well posted dairymen, the above return would be considered about $20 under the mark

In this, as in thousands of other cases, the creamery has, in reality, nothing to do with the matter. Profit or loss follows upon the fact, whether the man who owns the cows is a dairyman or not. Has he dairy cows to start with? Does he feed and handle his cows as a well posted dairy farmer should? Is everything done at the farm end to bring a good profit? The creamery is but an agent to make up and sell one product of the cow alone, the butter.

Right here is where the great mass of creamery patrons need better ideas of what they must do, if they amount to anything, more than to dance attendance on their cows for a year, without a cent of profit. A little reading and study on this question will help them wonderfully if they will take it.

MANURIAL VALUE OF FEED STUFFS.

The inquiry of A. D. C., Dryden, New York, as to the difference in the manurial value of oats and bran, and the suggestion that we "don't, apparently, figure much, if any, on manurial values," prompts us to give the subject somewhat more than a passing notice. A little more than four years ago, on page 818 of volume 25, we published a table showing the total fertilizing contents in a ton of the several more common feed stuffs, and their practical manurial value to the farmer, based upon the then current market values of nitrogen, phosphoric acid and potash.

There have been various revisions of the tables of analyses since that time, and some modifications in values, so that it, perhaps, is not inexpedient to publish a revised table. We said then, and still believe the fact to be, that the discussions at farmers' institutes, and the tables published in the books, are misleading, in that the majority of farmers understand the term "fertilizing constituents" to mean available manurial value. This is an erroneous conclusion, but all the same it seems to discredit the statements made.

In a ton of average wheat bran the chemist finds 53 4 pounds of nitrogen, 57.8 pounds phosphoric acid, and 32.2 pounds potash, and at the general market price of the elements, 15 cents, 7 cents and 4.5 cents respectively, it is very truthfully said, that a ton of wheat bran contains $13.50 worth of fertilizing material. That is to say, it would cost that much to purchase these amounts of nitrogen, phosphoric acid and potash, in the market, and every ton of bran withdraws these amounts of fertilizing material from the soil, less the very small amount of nitrogen (if any in the case of bran) derived from the air.

The same conclusions could be made in regard to the other feed stuffs, but the figures would be modified to correspond with the varying analyses. A ton of shelled corn takes less fertility from the soil than a ton of oats, and a ton of oats less than a ton of wheat, and a ton of milk much less than either, as will appear in the accompaning table.

When we sell a ton of hay or a ton of corn we are selling fertility that has come from the soil of the farm, and unless some return is made, the farm will become barren in the course of a very few years, because the available fertility has been taken away and sold. On the other hand, if we buy a ton of bran and feed it to stock, or if we feed the hay to stock, carefully husband the resulting manure and return it to the soil, we conserve or replenish fertility. Herein is one of the important elements of profit in animal husbandry.

In the last column of the table herewith, we give what we believe to be a conservative estimate of the value, to the farmer, of the manure made from a ton of the different feed stuffs mentioned. Every farmer knows that it is not possible to save all the manure or to preserve all the value of that which is saved. More than half of the total manurial value is voided in the urine, which cannot be saved without considerable loss, even with the best arrangements, and when saved, is very easily washed away. And so, without further specification of the sources of loss, we deduct from the total manurial content in the feed, 50% for this unavoidable waste in the grains, and 66% for waste in the hays and coarse fodders. This is in accord with the custom in England, where they are quite as careful about saving fertility, as we can expect to be. Further, instead of estimating that 80% of the fertilizing elements in the feed are voided in the excrements, as is commonly done, we adopt the exact figures of a feeding trial with milch cows, at the Wisconsin Experiment Station in 1866, namely: 62% for the nitrogen, 89% for the phosphoric acid, and 63% for the potash.

On these bases, the crude nitrogen in grain, silage and roots may have a manurial value to the farmer of 4.65 cents per pound, phosphoric acid 3.12 cents per pound, and potash 1.42 cents per pound. In hay, straw and other dry forage these figures would be 3.10 cents, 2 07 cents and 0.95 cents respectively. But even these reduced values, conservative as we have made them, cannot be realized if the liquid excrement is not saved, or if the manure piles are left to leach in the yard.

AVERAGE AMOUNTS OF FERTILIZING ELEMENTS IN DIFFERENT FEED STUFFS AND ESTIMATED VALUE OF SAME IN THE MANURE.

	TOTAL CONTENTS PER TON IN POUNDS.			
	Nitrogen.	*Phosphoric Acid.*	*Potash*	*Estimated Available Manurial Value.*
Corn silage	5.6	2.2	7.4	$ .43

Creamery Questions.

ED. HOARD'S DAIRYMAN:—Our people have been talking creamery for some time past. A firm of creamery owners who own a creamery and several skimming stations in neighboring towns, have talked of building a skimming station here. Their proposition to the farmers was that they would build and equip the plant, and buy the milk of the farmers, by the Babcock test, and pay them for the butter fat within two cents a pound of the Elgin butter price; that is, if Elgin price of butter is, say, 22 cents, they would pay 20 cents per pound for butter fat. Is that a fair transaction for the farmers? It does not seem to me like it is, if there is a gain in butter over butter fat of about 1/6. If it is not a fair price, what would be?

On what basis are creameries usually run, where they are not on the co-operative plan?

About what will a plant ready to run, to use the milk of, say, 400 or 500 cows, cost? What help is needed to run it? About what do farmers have to pay creamery owners for making and marketing butter?

If run on the co-operative plan, what would be the approximate cost of making, allowing for interest on investment, wear of machinery, etc?

Would like as much information as you can give us on the building, equipping and running of creameries. A READER.

Ohio.

The price paid for making and marketing butter is usually from three to four cents a pound, depending on the amount of milk to be handled. A pound of butter fat will make an average of 1.15 pounds of butter. The price that should be paid for butter fat will vary according to the price of butter.

In co-operative factories, each patron is credited with the amount of butter fat he brings to the factory. The butter is made and sold; all expenses of making and selling are deducted from gross amount, and the net returns are divided among the patrons according to the per cent of total fat each one has contributed. Formerly, and to a certain extent at the present time, the net proceeds were divided according to the weight of milk delivered by each patron. But this is only in cases where all milk is pooled, regardless of its per cent of fat, and no tests are made.

A creamery having capacity to handle milk of 300 to 500 cows can be built for from $800 to $1,500, and the equipment will cost about as much more.

Such a creamery will require a buttermaker at $60 to $75 per month, and a helper at $25 to $30. The cost of making butter on the co-operative plan varies widely, according to the skill of the conductors and the amount of milk made up. It may run as low as two cents per pound and as high as five.

University of Wisconsin, the Short Course for 1899.

The attendance for the past year was 196, more than double that of three years ago; of these thirty-two come from outside the state. Dairymen, stock breeders, etc., are rapidly appreciating the value of the graduates' services—one hundred calls having been received at the University during the past three weeks. Seventy-one students have secured positions in their respective lines of work, and numerous calls are coming in daily, that the College is unable to fill. Already 110 applications have been received for the next term, beginning November 28th, 1899.

Information Wanted.

ED HOARD'S DAIRYMAN:—I notice a party in your paper asking about how to keep check on milk drivers. I have never seen this discussed and would myself like to know how best to keep tab on them.

Bonham, Tex. D. M. B.

MR. H. G. M., OF WESTBORO, MASSACHUSETTS, WRITES:

"Six years ago I was a city boy too green to harness a horse. After two years spent with successful farmers as a hired man I started in myself. Now I have 38 head of Jerseys and my herd will bring me this year $3,500 to $4,000. I sell the milk and cream."

"I OWE WHATEVER SUCCESS I MAY HAVE ATTAINED TO THE GOSPEL OF THE DAIRYMAN."

ONLY ONE DOLLAR A YEAR FOR THIS GOOD FRIEND AND HELPER.

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name, Post-office and state of writer. Condense the questions into plain specific inquiry. Be careful to note if your questions have not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

GLOSSARY.

The terms used in this department of HOARD'S DAIRYMAN have the following significance:

RATION.—The total allowance of feed for twenty four hours

DIGESTIBLE NUTRIENTS.—That portion of the organic matter which can be digested by the animal and does not pass off through the bowels as excrement.

PROTEIN.—That part of the digestible nutrients which goes to the formation of lean meat, ligaments, hair, horns and the casein (or curd) of milk. It is generally believed, also, that protein may be, and many times is, converted into the fat found in milk. The basis of protein is nitrogen, hence the protein elements are frequently termed the *nitrogenous* parts of the food. They are also called *albuminoids*.

CARBOHYDRATES.—That part of the digestible nutrients which is the primary source of sustaining animal heat and furnishing the power for keeping the animal mechanism in operation. They are composed of the woody fibre of the plant and grain, and the starch, sugar, gums, etc., and in the published tables of chemical analyses are usually subdivided into the terms *crude fibre*, which is the least digestible portion of feeding stuffs and *nitrogen free-extract*, so-called because it does not contain any nitrogen.

ETHER EXTRACT.—That portion of the digestible nutrients which may be dissolved out of the food stuffs by ether. It is frequently called *crude fat*. Whether fat is actually digested and thus passed on into the circulatory system in a changed form, or whether it is simply separated from the other elements and always maintains its identity is an unsettled problem. It can be used by the animal for maintaining the body temperature, and for this purpose is from 2.2 to 2.5 times more efficacious than the carbohydrates. It is maintained, by some, that the fat in the milk comes, largely, from the crude fat in the food but it has been demonstrated that it is not absolutely necessary for this purpose.

FEEDING STANDARDS FOR MILCH COWS.

DIGESTIBLE NUTRIENTS

Dry matter.	*Protein*	*Carbohydrates.*	*Ether extract.*
lbs.	lbs.	lbs.	lbs.
23 to 28	2.0 to 2.5	12. to 15.0	0.5 to 0.8

FOR AN ONTARIO MILKMAN.

Advise the best ration from the following feeds: clover hay, $4.50, mixed clover and timothy, $5, with corn stover and straw. Grain feed, bran, $13, shorts $14, gluten feed $17.50, corn meal $16.25, chopped oats $20. Can get cotton seed meal but not sure of price. Will have a few mangolds and intend building a silo the coming season.

We retail Jersey milk at 6 cents per quart and ordinary milk at 5 cents per quart, (Imp. quart weighs 40 oz.)

Intend building stave silo 16×24; foundation of gravel and concrete six or eight inches deep for bottom of silo, after silo is erected bank around bottom with cement. Would this be satisfactory? W. W. E.

Ont.

From the feeds named we should select about as follows:

FORMULA FOR RATION.	*Dry Matter.*	*Digestible Nutrients*		
		Protein.	Carbohydrates	Ether Extract
15 lbs. clover hay	12.70	1.02	5 37	.26
10 lbs stover	5.95	.17	3.24	.07
4 lbs. bran	3.52	.50	1.54	.12
4 lbs. gluten feed	3.69	.82	1.94	.20
Totals	25.86	2.51	12.09	.65

This should suffice for cows in full flow of milk, and cows weighing less than 1,000 lbs. will not be likely to eat all the hay and stover. In that event reduce the allowance of hay.

The silo will probably work all right although we would not bank up around the bottom either inside or outside with so unyielding a substance as cement. The staves will probably shrink some, and then if there is a rim of solid cement on the inside they cannot be tightened. If the cement is on the outside more or less space will be left.

A KENTUCKY RATION—HARDENING BUTTER.

I would like a balanced ration of the following feeds: Ship stuff or otherwise wheat bran and middlings mixed; ground corn and cob, cut sorghum cane, and cut millet. Have been thinking some time of adding cotton seed meal; it is hard to get it here, and costs about $21 or $22 per ton. If I should conclude to use it, how much should be added to that ration, and is that too high priced for profit?

Our cows are grade Jerseys, and ages run from two to seven years; their weight runs from 700 to 900 pounds. We are milking 10 cows, and with the feed I have mentioned, the profit per month has been about $75.

We get 25 and 20 cents for our butter, the year around. H. J.

Mt. Sterling, Ky.

These cows are doing very well now, but it is possible they might do even better and at less cost for feed, by getting some cotton seed meal. For use with sorghum and millet for roughage, 1 pound of cotton seed meal is nearly as valuable as 3 pounds of ship stuff. Moreover, cotton seed meal helps to make a firm butter, and will be especially serviceable in this direction during the summer. But it is too concentrated, that is, contains so much nutriment in so small bulk, that it should always be mixed with some lighter material for feeding. Bran is excellent for this purpose, but any kind of cut feed will answer.

For the present we suggest as follows, for an average:

FORMULA FOR RATION.	*Dry Matter.*	*Digestible Nutrients*		
		Protein.	Carbohydrates	Ether Extract
10 lbs. sorghum hay	5.97	.35	3.73	.04
10 lbs. millet hay	9.23	.45	5.17	.13
4 lbs ship stuff	3.52	.51	1.83	.13
4 lbs. corn and cob meal	3.56	.26	2.52	.14
1 lb. cotton seedmeal	.92	.37	.17	.12
Totals	23.20	1.94	13.42	.56

Commence with not to exceed one half pound of cotton seed meal per day, and increase very gradually, up to nearly or quite two pounds—reducing ship stuffs and corn and cob meal, when the allowance gets above one pound.

REGISTERING INBRED ANIMALS—WET AND DRY FEED.

I have a standard bred Jersey cow, and have a standard bred Jersey bull, two years old, from the same cow. During my sickness, the cow and bull (her own calf) got together. Can the offspring be registered, or is the in-breeding too close?

2. I am feeding 2 pounds bran, 2 pounds corn meal, 2 pounds ground oats and 2 pounds shorts. Which will produce the best results in feeding, wet or dry? J. McK.

Stanton, Neb.

So long as the sire and dam are thorough bred and registered, the calf can be registered, regardless of close in-breeding.

If the cow is in normal condition, there is no reason for wetting the feed. It makes more work for the farmer, and the stalls and mangers cannot be so easily kept wholesome if the feed is wet. Besides which it is no particular advantage to the cow.

COST OF SILAGE.

Will you please let me know what ensilage is worth per ton? J. H. L.

Dutchess Co., N. Y.

The average cost of ensilage is $1.50 per ton. In individual cases the cost may be above or below this figure, depending on conditions of soil, labor, climate, ect.

ALFALFA IN NEW YORK.

I would like your opinion about sowing alfalfa. How much per acre, and how early in the spring. I would use it for soiling my dairy. I live 50 miles north of New York city, and fear the climate may be too severe.

New York. T. C.

There is much difficulty in obtaining a good stand of alfalfa in the eastern states, unless certain precautions are taken. The ground should be as free from weed seeds as possible. For this purpose, summer fallow the proposed alfalfa field for one season, to reduce the soil to proper fineness, and sprout and kill all seeds lying near the surface. The following spring sow from 20 to 30 pounds of alfalfa seed per acre, in drills, and cover lightly with a harrow. Sow without a nurse crop in April.

TUBERCULOSIS AND CROSS BREEDING DISCUSSED.

I have always been an admirer of Guernsey stock, but having lost two Guernsey bulls in last two years from tuberculosis, have now a full blood Holstein, and trust I may not lose 50% of my calves as have been doing. Would you have recommended this cross, having 11 cows, and most of them grade Guernsey or Jersey?

I am feeding stalks with corn thereon, and giving about 5 quarts of bran and what alfalfa hay they will eat. Shall soon have to feed wild prairie and millet hay. I know the corn would do more good if ground, but will it pay for husking, shelling and then going 6 to 10 miles to get ground? Of course hogs behind cows. My cows tested for February, 4.4%. Most of our patrons are 4% or less. Do you not think Holsteins at 3.8%, would be more profitable than my present condition? G. L. G.

Mission Hill, S. D.

Having already purchased the Holstein bull, it is rather late to ask advice. We can, however, unreservedly condemn the principal reason given for making the change. There is no breed immune to tuberculosis, and so far as the statistics show there is no considerable difference in the percentage of animals in the several breeds affected with this disease. Moreover, few calves die of tuberculosis, or as a sequence to tuberculosis in either parent. It is well demonstrated that perfectly healthy stock can be raised from cows that are decidedly tuberculous, provided they are separated from their dams at birth and fed on sound milk, or that which has been pasteurized, and are not otherwise exposed to the infecting germs.

This is not saying that you may not have excellent results from the cross now introduced. Some of the large producing cows have come from a similar cross, but the general opinion is that the average is not likely to be better. This is by no means a fully demonstrated conclusion, but rather a theoretical deduction, and we should not be disappointed if you have some excellent heifers and some inferior ones.

We do not think it would pay to husk and grind the corn, but it would pay a big profit to build a silo this coming summer for storing feed for next winter and next summer.

When the alfalfa hay is gone, you will find it profitable to add a full feed of bran to your daily ration, perhaps as much as 10 pounds per day to each cow that is near her full flow of milk.

A NEW YORK RATION.

Will you please give me a properly balanced ration from the following grains: rye, corn and cob, and wheat middlings, ground and mixed. I could get some gluten feed or oil meal, if you think it would pay me. My cows have common meadow hay with very little clover, and are mostly Jerseys and in full flow of milk. I could exchange my rye at 50 cents per bushel for rye bran at 75 cents per hundred, if it would make a better feed.

During the year '97, I made 2,495 lbs. butter from 8 cows, but did not do quite so well in '98, because of abortion among several of my cows, last winter. We use the United States separator, and supply private customers at 25 cents by the year. C. M. S.

West Lebanon, N. Y.

Estimated on the basis of its nutritive value alone, when ground rye is worth $20 per ton, rye bran would be worth $16 50; taking only the protein element into consideration (and this is what is particularly needed for balancing the excess of carbohydrates in the other feed stuffs), when rye bran can be bought for $15, ground rye would be worth only $12.37½.

For a minimum daily allowance to cows in full flow of milk, we can recommend the following:

FORMULA FOR RATION.	*Dry Matter.*	*Digestible Nutrients*		
		Protein.	Carbohydrates	Ether Extract
18 lbs. hay	15.63	.50	7.81	.25
5 lbs. rye bran	4.42	.58	2.52	.10
5 lbs. gluten feed	4.61	1.02	2.42	.25
Totals	24.66	2.10	12.75	.60

For cows of decided dairy ability, we would increase the grain somewhat—especially the gluten feed—and in that event, it is probable less hay would be eaten.

Corn and cob meal and middlings could be substituted for the rye bran, but it is probable the expense would be greater, as it would require 6 lbs. of these to equal the 5 pounds rye bran in protein. There would, however, be some saving in hay.

FOR NEW YORK HOLSTEINS.

Will you kindly name ration for herd of Holsteins? I have plenty of corn ensilage, hay, and shredded fodder corn and carrots. Bran, corn meal, middlings and linseed meal are easily obtainable at this point. I have certain cows that nothing seems to keep in condition so well as a portion of corn meal included in their ration. Will you also name the best balanced ration for young growing stock? F. P.

Saugerties, N. Y.

If confined strictly to the feeds named, we would select and combine about as follows for this class of cows:

FORMULA FOR RATION.	*Dry Matter.*	*Digestible Nutrients*		
		Protein.	Carbohydrates	Ether Extract
25 lbs. silage	6.60	.33	3.50	.18
8 lbs. hay	6.82	.22	3.47	.11
8 lbs stover	4.76	.14	2.59	.05
5 lbs. bran	4.41	.63	1.93	.15
5 lbs. ground corn	4.45	.40	3.33	.22
2 lbs. oil meal	1.81	59	.65	.14
Totals	28.85	2.31	15.47	.86

This is a large ration, but it is intended for large cows capable of making large returns. Milch cows that require corn to keep them in condition have the true dairy temperament, and should be fed accordingly.

We would just as soon omit the oil meal in the above formula, and take gluten feed in its place, by doubling the amount and reducing the bran and corn by an equal amount. We have not included the carrots, because the amount likely to be fed each day would make no considerable difference in the figures as an equivalent amount of hay or shredded stover would be refused.

For the young stock, we would recommend the silage, hay and stover, but little or no grain. Young, healthy animals can eat enough roughage, if of good quality, to keep them growing,—and fat must be avoided.

WHAT KIND OF A COW TIE?

I expect to build a new cow barn this spring and cannot make up my mind whether to put jacks in, or to have stalls and a chain to tie them by. If you will favor me by stating your experience as to which you think the most comfortable for the cow, for in whichever she is the most comfortable, that is the one I will get the best results from.

Whitford, Pa. C. C. S.

We suppose "jacks" to be a local name for stanchions, and if this is correct, there is

no room for two opinions. Use the tie. Or, still better, adopt some one of the several modern cow stalls, of which illustrations have been given in the DAIRYMAN from time to time.

The senior editor uses the so-callled "model stall", which consists, in effect, of a sloping rack for hay, the bottom about 30 inches from the floor. This forces the cow well back when standing up. While thus standing, notice where her hind feet are, and a little in front of them fasten a piece of 2 x 4 or 2 x 3, so that when the cow lies down, she will draw forward, quite out of the way of all droppings. Fasten with an ordinary halter.

The associate editor has some stalls made by hanging swinging partitions on the old stanchion frames, with a rope (or chain) running from one to the other, which prevents the cow from backing out, with a gutter at the rear to hold the droppings, and a device (anything which will answer the purpose, will serve) to prevent the cow from moving forward.

Each stall has some merit peculiarly its own. Some would prefer one and some the other. And there are other stalls, some patented, like the "Drown" and the "Bidwell", and some not patented, like the "Scott", (See page 30, this volume) the "Thorp" and the "Baker".

EARLY CORN FOR SILO.

I have a large silo and would like to fill early, so as to be through the 1st of September. What kind of corn should I grow? Will the eight row corn do, and how early can it be handled? I want a feed with the grain in with the ensilage. WM. H. S.

Belvidere, Ill.

Any early maturing variety will do. The eight rowed variety is an early kind and will probably do well with you.

Put in the silo as soon as it glazes.

PEAS AND OATS.

1. What kind of peas should be sown with oats for hay or silage?

2. Where can they be bought and at what price?

3. With oats yielding 40 bushels per acre on good corn land, what would be the yield in tons if cut for hay?

4. Is oat and pea hay difficult to cure in damp weather?

5. Will alfalfa silage bloat cattle?

6 What special fertilizer is there in the market for potatoes?

7. What is the commercial value of tankage, ground and unground?

8. What kind of a mill is necessary for grinding? WM. P. H.

Muscatine, Iowa.

It depends on the locality. If you have a dry, hot summer, the Southern cow pea is the best.

Any dealer in seeds will supply them.

In the South a yield of 3.5 tons of hay per acre is reported. It would probably be less in Iowa.

It is hard to cure in wet weather the same as any hay.

No.

Address dealers in fertilizers. They all have special makes for potatoes.

The value of tankage varies according to the per cent of fertilizing ingredients present. It may run from $16 to $26 per ton.

We do not know. Inquire of manufacturers. See ads in DAIRYMAN.

A CEMENT FLOOR FOR COW STABLES.

Can you or any of your readers tell of any experience with cement floors in barns? Also, I should like to know how much, and what kinds of cement should be used in building a cow barn floor? S. H. L

Northwood, Ia.

From a back number of the DAIRYMAN we take the following:

First excavate to a depth of about five inches below the line where you wish the surface of your floor to come, making the surface level and smooth. Fill in a layer of sand and gravel, about one inch deep, level off and firm well. Cover this with three inches of concrete, composed of five parts of clean, sharp gravel to one of Portland cement, mix dry, add water and re-mix thoroughly, and lay and pack firm. Finish the floor with a three-quarter inch covering of Portland cement and sand, composed of four parts cement to seven of sand, and finish with a trowel. The surface may be roughened at the finish, if desired, in order to prevent slipping. For cow stalls, with a gutter behind the cows, there should be a curbstone used along the edge of the gutter; otherwise the cement floor will soon begin to crumble and give way at the edge. By all means employ a man for this work, that knows his business, as this is a job that is very easily and irreparably damaged by poor workmanship. J. J. EDGERTON.

Iowa Agricultural College.

SILO QUESTIONS.

I wish to build a silo for next winter's feed for cattle. Part of the silo will be under the ground, say 12 feet, and 12 feet above. I prefer a tub silo, and wish to put in whole silage, if possible. Can I put in whole silage, so it will keep in a tub silo? What diameter will be necessary in order to have the silage keep? The corn will be bound with a harvester. Can I put as much silage in whole, as when cut with a machine? About how much more waste will there be in whole silage than cut silage? Give directions how to lay the silage.

I see by your paper there is any amount of trouble with garget and bloody milk. A cupful of ground beans, fed every other day with a little ground feed, is a sure cure, and does not hurt the cow; must compel the cow to eat it. E. B.

Lyons, Neb.

It is very doubtful whether you can silo the large, heavy dent corn, whole, and have it keep well. With the smaller flint corn it can be done. Success in siloing whole corn depends on the size of the stalk—a small stalk being necessary to have the corn pack well and prevent air spaces. The great point is to pack in layers, and see that every hole is filled, and the whole layer made solid as possible, before beginning another layer. There is more loss reported in feeding whole siloed corn; large pieces of the butts being left. We do not know of any figures giving the relative amount of cut and whole silage that a silo will contain.

FEEDING VALUE OF CARROTS.

Please give me feeding value of carrots for milch cows, how much to feed, etc., also what will be the yield per acre, should land be very rich? It is said that carrots will increase the flow of milk and give butter desired color. I want to plant 2 or 3 acres

Phillips Co., Ark. J. F. M.

Carrots have nearly the same feeding value as ruta-bagas. A yield of 28 tons per acre is reported when grown on rich soil.

As they are quite low in dry matter, (11.4%) their value depends more on their action as a succulent feed on the system of the animal, than upon the amount of nutrients they contain. When fed to cows, they will give the milk a higher color. It will not pay to feed them otherwise than as a relish, in small amounts.

THE GRAVITY CREAM SEPARATOR.

Will you please answer through the columns of your paper as to what you think of the so-called Gravity Cream Separator, which is a large tin can with a glass and faucet near the bottom of it. The process is: Put in as many pounds of water as you have milk (the colder the water the better) and let set from four to six hours; then draw off milk. Agents are selling them here at $7 to $15, according to the size, and claim better butter can be made by this process than any other. Also that the skimmed milk (which is half water) is far better than milk skimmed by a creamer or centrifugal separator. Also that the milk is skimmed cleaner and the cream is purer than any other process of getting cream. Would you advise buying one in place of a DeLaval or Sharples separator at $100 to $125 for from ten to 15 cows? S. E. S.

New York.

The gravity cream separator has been tried at several Experiment Stations and its performance found to be far below what is claimed for it. Everything claimed for the gravity separator can be equally well done in a shot-gun can. The dilution method does not give as clean creaming as deep setting and is no better than ordinary shallow setting.

The only time when it might be useful would be in the case of milk from cows far advanced in lactation. All other claims, as to improved quality of cream or skim milk, are without foundation.

A hand separator will pay a large interest on the investment in the extra amount of fat recovered over other methods of creaming.

BUTTER FAT AND LACTATION PERIOD.

For several winters my tests and yields of butter have gone contrary to what scientists endeavor to teach, namely: that as a cow gets further along in lactation, the tests of her milk go up. Added to this, they teach us that feed does not govern, in any way, per cent of fat. I find that May and June are the lowest months, except when July is excessively hot and flies are bad, like last year, when that was the lowest month. Directly the weather cooled in September, up went the tests and yield, until about the middle of November. Since then cows have shrunk in milk, and the tests and yield have gone down, averaging nearly c.5%.

What I would like to get at is, a test not of individual herds well taken care of, but a general test of a lot of patrons' herds, who give their cows a good deal of litter for feed, the open canopy for shelter at night, and look for the wool on their backs as protection against storms. Have any results from a general standpoint of average conditions been given? C.

Wash.

There are many things besides feed which affect the yield of milk, and a larger number which influence the per cent of fat.

Heat and flies will take the fat out of milk as readily as cold or rain, and should be equally provided against. It is very probable that if the cows were kept in a cool, shady stable, you would find that they would follow the rule of increased fat, which has been observed to accompany advanced lactation.

On page 856 of the last volume, you will find some records made by the Kansas Experiment Station at the Meriden Creamery, Kansas.

BABCOCK TEST IN CHEESE FACTORIES.

Will you kindly give a few of the principal reasons for using Babcock test in cheese factories? There is quite a difference of opinion among the patrons of our cheese factory. C. I. H.

Nunda, N. Y.

Primarily, the same reason exist for testing in a cheese factory as in a creamery—the prevention of fraud by watering and skimming the milk. On page 10 of the present volume, you will find a more extended discussion of the relation of butter fat to cheese. In the near future there will be a further discussion of the same subject in the columns of the DAIRYMAN.

MEASURING CREAM BY GAUGE.

Will you please inform us if there is any rule for figuring up the amount of butter we should have from cream measured by gauges and tested by the Babcock test?

This is the way our creamery takes in cream but I think the cream ought to be weighed when tested this way. C. E. F.

Monroe Co., Wis.

To give each patron his due, the cream should be weighed and tested. A gallon of cream will weigh from 8.1 pounds to 8.50

Salt Rheum

Intense Suffering—Could Not Sleep—Cured by Hood's Sarsaparilla.

"I had salt rheum on my arms, which itched intensely and kept me from sleeping. The skin on my hands would crack open. My friends believed I was suffering from blood poisoning. I decided to take Hood's Sarsaparilla. I did not see any improvement with the first bottle but continued with the medicine and after taking five bottles I was completely cured. My hands are now as smooth as I could wish." A. D. HAGEY, Elroy, Pa.

Hood's Sarsaparilla

Is the best—in fact the One True Blood Purifier. Sold by all druggists. $1; six for $5.

Hood's Pills are prompt, efficient and easy in effect. 25 cents.

Take a Cow

out of the pasture and feed her

Wilbur's Stock Food.

She will show no loss of milk, no loss of butter in quantity or quality. One cent's worth of Food a day saves $1.00 worth of grain per month. Package containing 40 feeds, with sample of White Rock Hoof Packing, by mail, for 50 cents.

Wilbur Stock Food Co.
179 2d Street, Milwaukee, Wis.

GLUTEN FEED.

CHAPIN & CO., Milwaukee, Buffalo, St. Louis, Boston. **Agents for GLUTEN FEED.** This feed is one of the best milk producers known, contains 27% digestible protein, keeps cows in healthy condition. Worth your attention in feeding economical rations. Sold in car lots, price based on its milk-producing value. Ask your grain dealer for price. Write our nearest office for full information.

THE MILK MAN

wants an Aerator, but he wants something more, he wants a cooler as well—aeration improves the flavor, but doesn't add to the keeping qualities of milk—it's the cooling that does that. The CHAMPION Milk Cooler and Aerator does both; it's cheap, too. Get our book "Milk."

CHAMPION MILK COOLER CO.,

67 Main Street, - - CORTLAND, N. Y.

pounds, according to its richness; a difference of several ounces of butter fat to the patron, if the cream is measured instead of being weighed. The cream gauge is a thing of the past and should not be used when we have better methods and apparatus for testing milk or cream. There is no rule that will give such strict justice to each patron if the gauge is used.

SIZE OF SILOS.

What diameter should we make a round silo for the summer feeding of a herd of fifty-five cows? It is desired to feed largely and do not expect to get much food from the pasture which will be not very large.

Macomb Co., Mich. TRUE BROS.

Fifty five cows fed silage all the year will use about four hundred tons; at the rate of forty pounds per head per day. If this is put into a single silo it will be 32×28 feet in diameter. It would be better to use two silos 30×21, especially if it is to be fed in summer.

AN ALABAMA RATION.

I have pea hay and corn stover to last till about the 1st of April; can then get cotton seed hulls at about $6 per ton. Would you buy them to mix bran, cotton meal and corn meal with, or not? Each of the above grains cost $20 per ton. Sell butter at 20 cents. Average a little over a pound of butter per cow, strippers and all, per day. Grass will begin to grow by the first of April. Please tell me how and what to feed a fresh cow, giving 40 pounds of milk a day, after April first.

May the DAIRYMAN and its editors live long to tell us boys how to dairy.

James, Ala. M. W. H.

Cows on grass crave some dry fodder, and in the absence of hay or other roughage would advise feeding hulls up to the limit of each animal's craving for them. Mix the bran, corn and cotton seed meal, equal parts by weight, and feed from 6 to 9 lbs. daily, varying the amount to the response made by each cow. If any cow develops an ability to turn more grain into milk, increase the proportion of bran and corn.

BREWERS' GRAINS ANALYSIS.

Please let me know in next issue of your your valuable paper if enclosed analysis is correct. S. H.

Crystal City.

The package that came with the above letter was a brewers' grains envelope containing corn bran, and we hardly know which analysis our correspondent wants.

The analysis of the grains given is some five per cent higher in protein than the average given in the feeding tables, but this is no proof that the analysis is not correct, as waste products of all kinds tend towards higher protein content; owing to more careful manufacturing methods by which the fat and starch are more exhaustively removed.

A PENNSYLVANIA RATION.

Please send me a daily ration for cows weighing about 1,000 pounds. Have on hand timothy hay, corn fodder, wheat bran, $16 per ton, gluten feed, $16 per ton, middlings, $18 per ton, oil meal, $28 per ton.

Wexford, Pa. S. M. C.

To 12 pounds timothy hay and 10 pounds corn stover add 4 pounds bran, 5 pounds gluten feed and 1 pound oil meal.

OIL MEAL AND BRAN.—FATTENING STEERS.

In a recent number you made the statement that when bran was worth 100, linseed oil meal was worth 130. Geo. A. Smith, New York Experiment Station, give bran nutritive ratio as 1 to 3.5; oil meal, 1 to 1.4, and from the analysis given by the Department of Agriculture I can't see but what the feeding value is different from what you state, especially to use as a balancing food.

Can you give me the cheapest fattening ration for fattening steers (coming 3 years) of the following feeds: Timothy, $6; clover, $5; bran, $12, oil meal, $25; corn, 30 cents per bushel.

I have been feeding bran with corn, but quit the bran, as they got to scouring. Am feeding just corn and hay at present and they are gaining better than with bran. I was trying to feed a balanced ration, but they didn't do as well as they are doing now.

White Co., Ind. C. E. G.

The statement referred to was limited exclusively to the nutritive or life sustaining value of the two feeds and is supported by the following figures. In 100 pounds of bran there are approximately 58 pounds of digestible nutrients, after reducing the fat to its carbohydrate equivalent; in 100 pounds of linseed oil meal there are 78 pounds of digestible nutrients, on the same basis, which is between 30 and 35% more than in bran. The value of either in special cases may be considerably enhanced, and herein there is opportunity for the exercise of an educated judgment.

For example, for feeding those steers, we should consider a little oil meal—say, two to three pounds per day—much cheaper at $25 than bran costing less than half as much. And with milch cows, where there is no succulent feed, like silage or roots, the oil meal has a special value. In either case, however, we believe some bran could be fed with profit. The amount to be fed must be determined by circumstances. These steers should receive every day just all they will eat with becoming relish and hold out from day to day. Let corn be the staple and the oil meal and bran the accessories. The bran is useful for extending the corn meal, so that it will be better digested and the oil meal has peculiar tonic and hygienic effects.

FREEZING THE FAT OUT OF MILK.

Is there such a thing as freezing butter fat out of the milk? If so which will suffer the most by freezing, the butter fat or the butter solids?

We are having some complaint of low tests that were taken during the cold weather.

River Styx, Ohio. H. B.

If you mean freezing the fat out of the milk after it is drawn,—no. If to the action of cold on the quality of milk given by the animal,—decidedly, yes. Nothing will so reduce the fat in the milk as exposure of the cow to rain, storms or severe cold, in any shape.

The cow will protect herself at the expense of the milk pail, even if she has to use up twenty cent butter fat to keep her warm. The report given by D. H. Otis, in a recent number of the DAIRYMAN, showing a loss of 21 per cent of fat after a severe cold snap, shows how close a cow's comfort and the dairyman's pocket-book are related.

CORN STOVER—SHREDDED FODDER.

What is corn stover as given in balanced rations for dairy cattle? Is it corn fodder as we put it up in the fall?

Stover: "Fodder and provisions of all kinds for cattle." This is the definition we find for stover.

Have you any knowledge as to the feeding qualities of shredded fodder, or is this (shredded fodder) what is meant as corn stover. Please tell us something about shredded fodder. S. S.

Kansas.

Henry, in Feeds and Feeding, gives the definitions:

Corn fodder: Stalks of corn, either green or dried, which are grown for forage, and from which the ears have not been removed.

Stover: The dry stalks of corn from which the ears havs been removed.

Shredded fodder is corn stover that has been passed through a shredding machine. The butts and coarser parts are broken into stringy like masses. These are eaten by cattle when they would reject the whole stalk. In consequence, it is a more valuable feed than an equal weight of corn stover.

How the Fund Will Be Used.

The National Dairy Union is endeavoring to raise $10,000 with which to secure the enactment of a law by congress, taxing all oleomargarine manufactured and colored in semblance of butter; $3,000 has already been raised. Precisely how this fund is to be used we have not seen stated, but we feel confident that not a dollar of it will be spent illegitimately. It is not pleasant to think, however, that where the Dairy Union puts up one dollar the oleo-makers can, and, if need be, will put up twenty to prevent the passage of any such law. While we recognize as clearly as any one, the need of some restraining measure, we doubt very seriously if this measure can ever be passed through congress.—*Jersey Bulletin.*

The fund will be used very largely in the dissemination of information among the people, paying the expense of sending able men to discuss the question before Congressional committees. Not a dollar will be used in any way that can bring the blush of shame to the cheeks of any dairyman. We believe the bill will pass. Every time the dairymen have gone before Congress, as with the oleo law in 1886, and the filled cheese law, they have won.

A City Milkman's Advice.

ED. HOARD'S DAIRYMAN:—If you can spare the space (in reply to U. A. Towns, page 33, No. 2) I will say first, he made the mistake of his life, when he stopped reading the DAIRYMAN, for while it contains but very little about peddling milk, the whole secret lies in producing the best article, and creating a demand for it. Having a trade established, keep your standard up or improve it, and you have no competition, as I will show you by my experience. I live in a town of 15,000 inhabitants, and when I started to peddle milk, there were 13 milk wagons running every day. My friends said I was foolish to start in a crowded field like this, but I told them I would have plenty of opposition but no competition. So I started by selling milk from cows that would test not less than 5% butter fat by Babcock test. Then I aerated all the milk as soon as drawn from the cows, and then cooled it to nearly 40° F. and bottled it with all the cream in it, which showed up well in the bottles. After my milk is all sold for the day, my bottles are washed in very hot water with a power brush; then thoroughly sterilized before refilling. I started in September, 1898, and am now selling 800 quarts a week, at 6 cents a quart, while the other milk dealers have cut down to 5 cents, and I am gaining trade every week. I simply claim that I have the cleanest, purest and richest milk in town, and when a lady once tries it, she will not alone continue to use it, but tells her neighbors and friends and they come for it. The only trouble is, I have no cream to sell, nor can I make butter as others, but my cream goes with the milk.

I find many people keep one or two cows in town, and they are hard competition, because they generally keep good Jersey cows that give good milk.

I think U. A. T. should join his hired man in reading HOARD'S DAIRYMAN and produce a better article than those doctors and lawyers do, and they will dispose of their cows, and come to him for milk. Aerate your milk and relieve it from all cowy or grassy taste; it will be sweeter and keep longer. I also use a "Maloney" triple strainer, and filter my milk before aerating it. Hoping this will benefit someone struggling the same road, I am for an honest dollar. J. P G.

Ottawa, Ill.

Creeping Consumption

Do not think for a single moment that consumption will ever strike you a sudden blow. It does not come that way.

It creeps its way along.

First, you think it is a little cold; nothing but a little hacking cough; then a little loss in weight; then a harder cough; then the fever and the night sweats.

The suddenness comes when you have a hemorrhage.

Better stop the disease while it is yet creeping.

You can do it with

Ayer's Cherry Pectoral

You first notice that you cough less. The pressure on the chest is lifted. That feeling of suffocation is removed. A cure is hastened by placing one of

Dr. Ayer's Cherry Pectoral Plaster over the Chest.

Second Series, VIII.

GLOSSARY.

Sporadic:—Said of a disease when it occurs occasionally or accidentally

Immunity:—A state of insusceptibility toward any specific bacterial disease.

Placenta:—Equivalent to afterbirth.

Incubation period—Every disease has a certain lapse of time between the introduction of the disease germ, and the breaking out of the malady. Such a period is known as the period of incubation.

Spermatozoa;—The male reproductive element in the semen.

CONTAGIOUS OR EPIZOOTIC ABORTION.

Abortion, or as it is frequently called "slinking" or "slipping" the calf, may arise from a great variety of causes. Exposure, shock, effect of acute disease, insufficient nutrition, and numerous other factors may be the cause of an animal's aborting her young, but such cases are accidental, and do not spread from animal to animal. Occasionally the general condition of the herd, predisposing the system to abortion, may, simultaneously, produce troubles of this kind in a number of animals. Not infrequently it happens that a single case of abortion is followed in a short time, by several others. Under such circumstances one may well have reason to suspect that the difficulty is not sporadic or accidental, but communicable from animal to animal, and that the cause does not rest in the manner of feeding or handling the animal, or the condition of her system, but in a specific organism that is distributed throughout the herd in various ways. Sometimes the disease establishes itself in a herd, and acquires such intensity, that the loss of calves is practically total. In the course of a few years, the difficulty seems to wear itself out, and gradually disappears, but any fresh animals introduced into the herd, from time to time, are quite likely to fall victims to the malady. This indicates that the disease confers a type of immunity by which the animals that have once had the disease, become, in course of time, refractory to the disease germ itself, just as a person is proof against small pox or most other contagious diseases, by virtue of the original attack.

The contagious nature of this type of abortion has been recognized for many years, but all attempts to find the true cause have, until recently, failed. It was natural to expect that the disease was due to some sort of a micro-organism, but the specific parasite was not discovered until 1896, when Bang, the Danish veterinarian, proved the relation of cause and effect between a specific microbe and the disease. His researches show that the disease germ affects the walls of the uteras, producing a catarrhal inflammation between the womb and the adhering afterbirth. This causes a sloughing of the placenta, and thus deprives the foetus of the necessary nourishment from the mother. The poisons found by the growth of the germs are also absorbed by the placenta, and affect the tissues that sustain the life of the developing calf. The period of incubation between the infection and the delivery of the calf, is quite prolonged.

Bang, found that it required ten weeks between the introduction of the disease germ into the vagina and the beginning of the abortive action. This indicates the slow and insidious nature of the trouble, and explains why its continuance in a herd is so prolonged.

MANNER OF INFECTION.

Recognizing the germ nature of the disease, it is self-evident that the trouble can only be caused by the introduction of the causal organism from some outside source. If one is acquainted with the way in which the germ finds its way into the animal, it would be comparatively easy to prevent its wide spread distribution. One of the chief agents in spreading contagion is in serving a cow with an infected bull. The animal himself may have been entirely free from all trace of the malady, but in a previous service on a cow that has the germs of the disease in the generative organs, he may acquire the disease, and thus widely dissiminate it among herds that were previously free. These microbes readily pass into the uterus with the spermatozoa, and find lodgment in those tissues that seem to be especially susceptible to its development.

It has been claimed by some that the bedding or litter under an affected animal may serve to retain the disease germ unimpaired for a considerable period of time, and so function as a carrier of contagion. Unquestionably the microbe may pass out from the uterus with the vaginal discharge, and thus be spread over the surface of the stall. Whether it can be introduced into the vagina indirectly is a question on which the evidence is not so clear, although it not infrequently happens that animals occupying stalls previously used by other aborting animals acquire the disease.

PRECAUTIONS TO AVOID SPREADING.

It is possible to control the distribution of the organism by antiseptic solutions. Strong disinfectants cannot be used on the mucous surfaces of the generative organs, but in a dilute condition they are permissible. Even corrosive sublimate in proper dilution (say 1.800 or one-eighth as strong as the ordinary disinfecting solution) has been recommended as a uterine wash. In cases of contagious abortion, the afterbirth should be quickly removed, and properly disposed of. Not infrequently carelessness in this regard is a means of propagating the disease. It is often asserted that sympathy, or the inhalation of odors is a potent cause of abortion, such as the sniffing around a dead fœtus that has been aborted by other animals. It is much more probable that infection is such cases occurs directly by the absorption of the germ from the calf or afterbirth than in any other way. In all cases of this disease, care should be taken not only in regard to the disposal of the fœtus and afterbirth, but the hinder parts of the affected animal should be bathed for a time with a dilute corrosive sublimate solution (1:2000) or with 2% corbolic acid solution. One must bear in mind that the disease is communicable, but that the cause can be prevented from spreading by destroying its vitality with these germ killing solutions.

Book-Keeping on a Dairy Farm.

Ed. Hoard's Dairyman:—H. G. D., Toledo, Ohio, asks about keeping accounts with his herd, or book-keeping on a dairy farm. I think this would be a good subject to write on for a time through the columns of the Dairyman. My business in the past few years has given me a good opportunity of seeing the lack of book-keeping among the best of our dairy farmers, and why this is so, is a strange thing, for no business should require a more careful and accurate accounting than a herd of dairy cows and their products. Unlike an ordinary business, the careful keeping of accounts will not only show just what is being done, but will increase the profits by showing the cows that are eating more value than they yield. It also shows results from feeding different feeds, which enables us to select feeds that will yield best returns at least cost.

As an example; we are saving now on 25 cows, 7 cents daily, each, or $1.75 total, by knowing just what our cows require, its cost, etc. This saving, is quite an item on 25 cows, and as we will soon milk 35 or 40, the saving will amount to a large sum in a year. Our method of book-keeping is briefly this: At barn, every cow's milk is weighed and put on a monthly milk sheet; these sheets are of good card board; they are carefully filed away, so that at any time a cow's daily record can be seen. The monthly total of milk is placed on a ledger; the cow's Babcock test also, and as feeds are all carefully weighed, a cow's month's work is before us at any time. From barn, we go to creamery where each milking is weighed on a platform scale and recorded on a sheet. This sheet also shows the Babcock test of herd, how many pounds of milk it takes to make one pound of butter, and also shows just how many pounds of butter comes from churn. All milk fed calves is also recorded. These above figures are all given a place in ledger.

We have also printed forms, or monthly statements, that we fill out. They show total

COUGHS

DAIRY FOR SALE.

On account of failing health, the undersigned offers for sale, at a bargain,

- - MEADOW FARM DAIRY, - -

Located within one mile of the post-office, city of Stevens Point, Wis., containing 300 acres of land; 200 acres under cultivation, balance first-class farming land and pasture. This dairy is well established, having been in full operation for over twenty years; 35 cows are now milked, from which $9 00 worth of milk is sold daily. The number of cows and the receipts from the sale of milk and cream can be easily doubled. Every quart of milk and cream produced is sold right at the door; the milk at three cents and the cream at fifteen cents; all sold to one man. This farm is under a high state of cultivation; 20 acres is now seeded to clover, and 40 acres to timothy. The buildings are all in good condition, having been built since 1892. A new silo was built during the past season. This entire property, including the necessary machinery for carrying on the place, 5 horses, 6 head of young stock, full blooded Jersey bull, wagons, tools, etc, is offered for sale on reasonable terms. The best of reasons for selling. Here is a great opening for the right man. Address

GEO. E. OSTER, Stevens Point, Wis.

Absolutely perfect. Water always fresh. Soon pays the cost. No disease where used Cheapest because best. Send for catalogue.

The Anti-friction Four Burr MOGUL

Will Actually Grind 60 to 80 Bushels per hour. Has four burrs nearly three feet in diameter grinding at once. Grinds **Four Times as Fast** as other mills; has no friction; all the pressure is on the grain. No gearing, no oil needed, and the lightest draft known. We manufacture the largest and best line of Feed Mills sold, including the famous Iowa Mill No. 2, for $13. Agents wanted. Iowa Grinder and Steamer Works, Waterloo, Ia.

CHERRY'S Feed and Litter CARRIER

An invention for cleaning out barns and feeding stock. The most practical device of the present day. Send for circulars to D. B. CHERRY & CO., Knoxville, Marion Co., Iowa.

pounds of milk in month; pounds fed calves (whole milk); number of pounds used for making butter; number of pounds used to make cheese; pounds of butter made; pounds used in family; pounds sold; average cost of feed for pound of butter; number of cows in milk; heifers two years old in milk; cows dry; cows sold; cows bought; calves born; number of calves being fed milk; number of pounds of milk fed calves (skim milk); total pounds skim milk fed hogs, its value, per cent.

We also have a page in our ledger for each cow, showing when fresh, when dry, sex of last calf, breeding, and general remarks, showing any special traits of cow, such as subject to caked udder when freshening; liable to abort; desire to go dry too soon; liable to bloat; liable to have milk fever or any other thing we may have found out that will be a good thing to remember. Our plan is of our own devising and has answered our purpose for several years, but if any one can give us better ideas, we will gladly adopt them. Would like to have this matter discussed by several of our DAIRYMAN readers. BUFF JERSEY.

Our Special Elgin Letter.

ED. HOARD'S DAIRYMAN:—The offering of butter on Monday's Elgin Board of Trade aggregated 5,760 pounds, all bids and all sales being at 20 cents, at which price the Quotation Committee announced the market firm. The sales reported were:

Factory.	*Pounds.*	*Price.*
Red Clover	1,520	20 cts.
McConnell	600	20 cts.
Shattock's Grove	1,800	20 cts.
Shabbona	1,200	20 cts.
Shabbona Grove	660	20 cts.
Total	5,760	

The sales for the corresponding week of the three preceding years were as follows:

March 14, 93, 8,400 lbs. of butter sold at 18½ cts.
March 15, '97, 24,320 lbs. of butter sold at 18 cts.
March 16, '96, 12,900 lbs. of butter sold at 21 cts.

The New York market Monday was reported firm at 20 cents. H. C. B.

Elgin, Ill., March 13, 1899.

DAIRY MARKETS.

ELGIN, March 13.—Butter—Firm; offerings 96 tubs; sales 96 tubs at 20c.

CHICAGO, Ill., March 13.—Butter—Creamery, extra 19@19½c; firsts, creamery 17@18c; seconds 14@15c; dairies, selections 17c; No. 1 15@16c; No. 2 12@12½c; extra ladles 14c.

Eggs—Fresh, at mark, cases included, sold at 13c per doz.

Cheese—Full Cream Twins, good to choice 11c; Cheddars 10¼@10¾c; Young America 11@11¼c; Swiss 10@13c; Limburger 7@10c; Bricks 8@11½c.

Cattle—Receipts were estimated at 19,000, including 1,500 straight Texas There was a scarcity of well matured beeves, and some of the best offerings sold at steady prices The general market, however, was weak at 10c decline for both natives and Texas. Trade was act ve and a good clearance was made. Exporters bought freely, principally at $5@5 25. Twenty 1,568-lb steers sold to a New York buyer at $5.80, with a three load bunch averaging 1,594 lbs. at $5 75. Steers averaging 890@1,620 lbs. sold at $3.85@5.65; bulk $4.60@5.30; corn fed Westerns $4 30@5.45; straight Texas steers 752@1,263 lbs. $3 75@4.80; Texas bulls $3.25; native butcher stock $2@4.90. Forty head of fancy 1,302-lb Western heifers sold at $5.10; feeding cattle $3.70@4 50.

To-day's receipts are estimated at 3,000 cattle: 25,000 hogs: and 15,000 sheep.

Bran—Quiet and sold at $12.25 per ton.

MILWAUKEE, Wis., March 13.—Butter—Creamery—Fancy prints per lb. 19@19½c; extras per lb. 19@19½c: firsts per lb. 19⅛@20c; seconds per lb 16@16½c; imitations per lb. 15@16c; Dairy selections per lb. 15@16c; roll, fair to choice fresh 11@13½c. Market unchanged and fairly active, and supplies do not accumulate.

Cheese—American Full Cream, October Twins 10½@11c; Brick, October choice, 10½@11c; winter made pe lb. 10@10½c. Limburger, fall choice per lb 9½@10c; winter made per lb. 9c: Swiss Drum, choice 12½@13c; Block, choice 10@10½c. Market strong for all but Limburger, the demand being fair and supplies moderate.

Eggs—Fresh, per doz 12c. Market steadier; receipts and trade now equally fair some sales were made at 12@12¼c, including cases.

NEW YORK, March 13.—Butter—Creamery, Western, extras 20c; firsts 19@ 9½c; state extras 19½@20c; firsts 18½@19c.

Cheese—State Full Cream, large, colored or white, fancy 12c, choice 11½@11¾c; small fancy 12½@12¾c.

Eggs—Western 14c.

PHILADELPHIA, Pa., March 13—Butter—Separator creamery, extra 20c; creamery firsts 19c; seconds 18c: imitation creamery, extra 17c: firsts 16c; seconds 14c; ladle-packed extra 15c.

Eggs—Pennsylvania and near-by 13c; Western 13c½; Southwestern 13c; Southern 13c.

BALTIMORE, Md., Mch. 13—Butter—Market quiet; creamery separator extras, 22@23c; creamery separator extras, firsts, 20@21c; creamery firsts 19@20c; ladle extras, 16@17c; Western store-packed, 13@14c.

Eggs—Market easy, strictly fresh stock 17.

ST. LOUIS, Mo., Mch. 13.—Butter—Firm, creamery, 18@22c; dairy, 13@17½c

Eggs—Higher; 11c.

KANSAS CITY, Mo., Mch. 13.—Butter—Steady. Creamery, 14@17c; dairy, 16c

Eggs—Steady; fresh 10½c.

CINCINNATI, O., Mch. 13.—Butter—Quiet at 21@21½c

Eggs Quiet; 10c.

Cheese—Firm; good to prime Ohio flat, 11½c.

NEW ORLEANS, La., Mch. 13.—Market easy 20½c on Elgin creamery.

NEWARK, N. J., Mch. 13.—Market steady; 20c for best extras. Receipts liberal.

BOSTON, Mass., Mch. 13.—Butter market steady; 21c for best.
Cheese—Very firm, 12½c.
Eggs—Steady; 15c.

DETROIT, Mich., Mch. 13.—Butter—Creamery slow, extra Elgins 21c. Fancy dairy 16c.
Eggs—Weak; 12½c.
Cheese—Firm; 12c.

WASHINGTON, D. C., Mch. 13.—Market steady, 20½c.

PITTSBURG, Pa., Mch. 13.—Butter dull and weak. Creamery 19@21c; choice country 16@17c.
Cheese—Firm with short supply. Full cream New York 12@12½c; Ohios 11½@12c.
Eggs—Away off, 12@13c.

BALTIMORE MARKET.

BALTIMORE, March 9.—Butter—Receipts of separator creamery the past week have been very light, consequently trading in this class of goods necessarily would be limited, even if all were sold, which, unfortunately, perhaps, was not the case, because of objections on the part of the buyers to the continued unattractiveness with respect to quickness of flavor, and the unwillingness of the receivers to concede the objection well taken; at this time, buyers affect to expect full new milk to all parcels with any pretentions to high grade, saying, "practically is this not the middle of March, and does not new-milk butter generally predeminate at this time?" To which the seller says no, but thinks yes, and straitway tries to get all possible for the dull-flavored lots that he can sell, and hopes for some buyers with dull senses to come along and take the others The gathered cream lots are in very small supply, and grading about as before; the demand is not quite as active as it was, because many have been driven to looking into other lines for supply. Imitation creamery is very scarce, so also are ladles. There is a small but steady demand for June and summer creameries, and it is believed that all now in the freezers can be disposed of before the 15th of April Blocks and prints are in full supply, with an indication of a surplus in the near future. Rolls are arriving in small quantity and have prompt sale. Creamery separator extras 22c; firsts 20@21c; seconds 18@19c; gathered cream extras 19c; firsts 18c; seconds 17c; Ohio, extras 20@21c; firsts 19@20c; seconds 17@18c; roll, extra 14@15c; firsts 13c; seconds 12c; W. Va. roll extras 13@14c; firsts 12c; seconds 11c: creamery blocks (2 lbs.) extras 23@24c; firsts 21@22c; seconds 19@20c; prints (¼ lb.), extras 23@24c; firsts 20@21c; seconds 18@20c; Md. Va. & Penna. prints extra 20c; firsts 18c; seconds 15@16c.

Cheese—Our cheese market is in good shape and firm with moderate offerings, and a good demand for all grades. N. Y. State Cheddars fine 11¼@11½c; choice 10¼@10½c; fair 7@8c; Flats, fine 11¼@11⅛; choice 10½@10¾c; fair 7½@8¼c; Small, fine 11½@11¾c; choice 10¾@11c; fair 8½@9c, Ohio Flats, fine 10@10½; choice 9@9½c; fair 8@8¼c; Picnic, fine 10½@10¾c; choice 9½@10c: fair 8½@8¾c; Swiss Cheese, fine 11@12c; choice 9@10c, fair 8@8½c.

Eggs—We are glad to say that the see saw market of the past two weeks has about settled, and we trust from now on to be able to approximate the market; receipts so far this week have been fair, and what lots that have been coming have met with prompt sale. The demand, while not active, is very good, and we look for a continuance of same Our quotations are for sales made this day; the market is unsettled, and we look for lower prices. Duck eggs continue in light supply; there is quick demand for all large, clean eggs, small or dirty eggs will not sell to advantage. Market unsettled at 17c. G. M. LAMB & BRO.
301 Exchange Place.

NEW YORK MARKETS.

NEW YORK, March 11.—Butter—Receipts for the week, 34,431 packages Exports for the week, 3,765 packages. There is no change in the market since our last. Receipts were liberal, trade only moderate, but prices have remained steady all the week and at the close there don't seem to be any surplus of extra fresh Creamery butter. Twenty cents was the ruling price for finest and good to fine creameries sold at 19 cents; off quality parcels were offered at 16 to 18 cents, without resulting in free business. Selections of New York State Dairy butter brought 19 cents and is wanted, but most of the tubs arriving are inferior quality and sell at much lower prices.

Very light business reported in old butter; we note sales of best quality June Creamery at 16@17 cents, also sale of 200 tubs to bakers' supply trade at 14 cents. What is left of old New York State Dairy is offered at 13@15 cents. We quote: Creameries, extra, 20c, medium 19@19½c, poor 16@18c; Dairies, extra 19c, medium 16@17c, poor 13@15c.

Cheese—Receipts for the week 7,210 boxes. Exports for the week, 7,467 boxes. This has been a lively week for the cheese trade and closes with an advance of fully one-half cent on all grades. We note sales to Western New York people of about 800 boxes fine white cheese at 11@11¾c, and say 1000 boxes for Pennsylvania account at same prices: also several thousand boxes home trade at prices ranging from 11@12½c, the latter price for fine September small size cheese. Market closes with light stocks and prices firm with advancing tendencies. We quote: Full cream, small, extra, 12½c, medium 11@12c, poor, 10@10½c; Full cream, large, extra, 12c, medium 10½@11½c, poor 9@10c; Part Skimmed, extra, 9½@10c, medium 8@9c, poor 5@6c.

Eggs—Receipts for the week, 4,501 cases. Prices kept tumbling all the week, culminating to-day (Saturday) with active trading at 14c. We quote: New York and Pennsylvania, per dozen, 14@15c, Western & Northern Sec., 14c; Southern, 13½@14c. DAVID W. LEWIS & CO.
177, 179 Chambers St.

FOREIGN MARKET.

BOSTON, March 11 —Cable advices of this date from the principal markets of Great Britain to Geo. A. Cochrane give butter markets as quiet with American a dragging sale. Arrivals of Australian and New Zealand are quite sufficient for current wants of buyers, and some held stock is being pressed for sale. Finest Australian at 20½@21c, finest Canadian in boxes about the same. American creameries are selling all the way from 16@19c, very little good enough to bring the latter price. The large arrivals of New Zealand butter, the bulk of which is below average quality, places American butter to great disadvantage. Ladles and imitations have had a slow sale, as many of these New Zealand goods have been lowered to a price to take their place.

Cheese markets are quite firm, and prices the turn dearer. Finest Septembers are held at 11@11¼c, with some holders asking for more,

LIVERPOOL, Mch. 13.—Butter—Finest United States, 80s; good, 65s.
Cheese—American finest white and colored, 50s.

WHY USERS WHO KNOW AND USERS WHO THINK Buy "ALPHA" Disc Cream Separators.

The interior body dimensions of an "Alpha" De Laval No. 1 separating bowl (the standard Factory size) are 5⅛ inches depth by 9¾ inches diameter. The same dimensions of a "Baby" No. 2 "Alpha" bowl (the standard Dairy size) are 5 inches depth by 3⅞ inches diameter.

At a speed of 5600 to 6000 rev. per minute these bowls have actual separation capacities of 2500 lbs. and 400 lbs. per hour, respectively. At a wide range of temperature and a wide variation in thickness in cream they effect a uniformly thorough separation, as close on an average as 0.05 of butter-fat left in skim-milk.

By reason of small size of bowl and relatively low speed they run with ease by hand and with small consumption of fuel by power, which in conjunction with perfect mechanical construction—regardless of cost of manufacture and finish—gives them great durability.

All other cream separators are and must be twice as large in size or require double the speed, or both. All other bowls, to attain some capacity, are from half again to three times as large But one other type of Factory machine can be run at as low speed, while it has a three times larger bowl. All other Factory machines require a speed of 8,000 rev. per minute. The latest piece of mechanical idiocy in Factory separators requires a speed of 25,000 rev. per minute. All other Dairy separators require a speed of from 7,000 to 12,000 rev.

No other machine of any kind is capable of maintaining an average separation, under practical conditions, closer than from 0.1 to 0.5. High temperature is necessary and running a heavy cream either impossible or else involving still poorer separation and injury to butter product.

All other Factory machines require from three to five times the amount of power and consequent fuel consumption. All other Dairy machines require from one-half more to three times the amount of power, and are consequently only operatable by hand with greater effort in the smaller sizes and by power in the larger sizes which can be easily run by hand in the equivalent "Alpha" styles.

All other machines are made cheaply in the effort to sell cheaply. Their greater size and greater speed involve just so much greater wear and tear, cost of maintenance and impairment of durability.

The reason for all of these differences is found in the "Alpha" disc system of divided strata separation used in the De Laval machines and so protected by patents that its use is possible in no other. Feeble attempts at imitation, as far as patent restrictions will permit, are now to be found in almost every other make of machine. The only machine in which this is notably not the case requires a speed of 25,000 rev. against 6,000 rev. for an "Alpha" bowl of similar capacity, will then skim only to an average of 0.15 as compared with 0.05 for the "Alpha", and requires that a skilled operator stand over it and give it constant attention to keep it from breaking down or going to pieces

This is the whole separator story made as plain as volumes could make it, but if you would have it in greater detail you may find both detail and illustration in the new De Laval catalogues—"Dairy" No. 279, "Creamery" No. 509.

READING NOTICES.

All Reading Notices under this head are at the rate of 25 cents per line.

Wanted—Man and wife, no small children, on dairy stock farm, two miles from city. Good wages for right people. Write for particulars. Address, CARL MUTH, Sheboygan, Wis.

For Sale, Rent, Exchange—To responsible creamery men, fully equipped creamery; only one in county. Rare chance for right parties. Owner a lady, non-resident. Address, with stamp, A. J. FERGUSON, Wayne, Neb.

Here is a good opportunity to get just the Babcock milk tester you need for either a large or small dairy. Four bottle size $4 00, eight bottle $5.50. Advertisement in this issue of the DAIRYMAN. J. J. ANGUS, Plymouth, Wis.

For Sale—New De Laval Baby No. 2 separator for sale. HYGEIA CREAMERIES, Ft. Calhoun, Neb.

For Sale or Rent—The Portage creamery, Portage, Wis. Immediate possession. Liberal terms to good party. WILLIAM FULTON, Prop. 5-tf

Wanted—I want to buy second-hand Alpha, 2,000 lbs. capacity. G. B. TOLMAN, Plano, Ill.

Wanted—Man and wife experienced in dairy farming; steady and trustworthy. Good chance for right party; good wages, good home. Box 116, Wayne, Du Page Co., Ill.

Wanted—Position is wanted as manager of a stock or dairy farm, by an experienced man. Would board help. Address LOCK BOX, 724, Malone, N. Y. 5-4

For Sale—One Acme Alpha Turbine Separator, re-balanced and re-tinned. Also churn, 2 cream vats, milk vat, butter worker (Eureka), milk cooler, shafting, piping, etc. These are second-hand but in good order. Will be sold at less than half the cost of new. For particulars, address C. C. VROMAN, Rodman, Jeff. Co., N. Y.

Wanted—Position in some good butter and cheese factory by a competent man with years of experience and can take full charge of creamery. Is posted in the latest methods in butter making and operating machinery. Can furnish the best references. N. NELSON, 923 4th, St., Sioux City, Iowa.

Wanted—Ten Men; able to give $200 security. To canvas for memberships to the Veterinary Science Association of London. Apply in person or by letter to room 5. Sutherland block, Janesville, Wis. 5-3

First Class—Cheese maker wanted. Address FEUDRICK BROS. Dunlap. Neb.

For Sale—Holstein-Friesian bull calf 6 months old, from a No. 1 cow. 80 lbs. milk per day and 18 lbs. butter per week. Will sell very cheap if taken soon. Want room for others. All particulars can be had by writing to WM. HAMBLY, Belmont, Wis. 5-2

Creamery For Sale—or rent. Excellent location. Address B. 150, care HOARD'S DAIRYMAN.

For Sale—Two Jersey heifer calves and a bull ten months old from a cow making 19 lbs. butter in a week. All registered. N. B. WHITE, Oconomowoc, Wis.

For Exchange—Aspinwall potatoe planter, in good order, for small upright boiler or cream separator. JNO. A. FUTHEY, Bellaire, Ohio.

For Sale—Registered Guernsey bull calves, and also a few females. Address JOHN BARTH, 109 Clinton St., Milwaukee, Wis.

For Sale or Exchange—Guernsey Bull Honorius 3361. Dropped March 9th 1893. Also his son dropped March 18th, 1898. Solid light red color. Write for prices, etc. WM. H. SWARTZ, Box 119, Waukesha, Wis. 4-2

For Sale—A first-class creamery 25 miles from Sioux City. Write for particulars and terms. DEWITT GOODRICH, Climbing Hill, Ia. 3-3

For Sale—A first-class cheese factory six miles N. W. of Appleton. Good location and everything in first-class shape. For particulars address. NICK HUSS, Appleton, Wis. 4-3

For Sale Cheap—Farm of 120 acres. One mile from P. O., creamery, and depot, Good and new buildings. Everything O. K. A bargain on easy terms. Address F. R. CONSTANCE, Waupaca, Wis. 4-2

Hermanville Tamworths, Cross-heds, etc. J. A. MACDONALD, Hermanville Farm, P.E.I., Can. 32-52

For Sale—One first-class creamery and skimming station. DOWNING MFG. CO., Downing, Wis. 35-tf

An Entire Carload—Of high graded Jersey cows and heifers are in my hands for sale immediatley. F. H. MERRELL, Portage, Wis. 52-tf

For Sale—A very desirable and good paying dairy, consisting of 20 head, or more of Holstein graded cows; average milk sales of two hundred dollars per month. C. H. ELLIS, Waxahachie, Texas. 52-tf

Wanted—To trade a 43-acre farm, good six room cottage, and barn. Land rolling, and nearly surrounded by oil wells, producing from 10 to 400 bbls. per day, ½ to 3 miles away. Situated 10 miles from Parkersburg, 4 miles from railroad. Will be sold for high grade or full-blood Jerseys or $1,500.00 cash. This is cheap outside of the prospect for oil. Don't write unless you have first-class individuals. Also will sell or trade 416 acres of fine coal land in Kanawha county, 6 miles south of Charleston, Davis' Creek. R R. runs through property. 95% of land underlaid with three seams of coal, one seam, 40 in., is free from any slate and with a bare trace of sulphur. There is no finer bituminous coal in West Va Will take $5,000.00 worth of full-blood Jerseys and $5,000.00 in notes of one, two and three years. Titles guaranteed, J. F. WOODYARD, Parkersburg, West Virginia. 2-4

Lands in Wisconsin Cheap—The Chicago, St. Paul, Minneapolis & Omaha Railway Company has upwards of 400,000 acres for sale in northwestern part of the state at low prices and on long time. These lands are most desirable because of their proximity to the markets of Minneapolis, St. Paul, Ashland, Eau Claire, Duluth and Superior. If you wish to visit these lands homeseekers cheap excursion tickets can be secured at C. & N. W. ticket offices in Chicago, Milwaukee, Janesville, Beloit, Elgin, Aurora, St. Charles and Dixon March 7th and 21st. Maps and information furnished on application to G. W. BELL, Land Commissioner, Hudson, Wis.

From the Far West.

Breeding up a Dairy Herd—An Investment Which Paid Fifty Fold—Bones for Fertilizer—Farm Creamery Plan Wanted—Ration Formula.

ED. HOARD'S DAIRYMAN:—Though I have only been a subscriber to your valuable paper a little over a year, I have become converted to its teachings on scientific farming and feeding for best results. Though I have not been able to secure other subscribers to your paper than those sent last fall, I never fail to speak a good word for it when opportunity is offered.

Three years ago I purchased the best bred registered Jersey bull I could secure, at a long price, to head my dairy herd, most of which were registered Holsteins of excellent dairy qualities, the balance grade Holsteins and common stock.

The present result is that I have twenty-four head of the special-purpose breed, coming two or three years old, comfortably housed in a 30 x 40 basement barn, well lighted and ventilated, and otherwise convenient, built on the "New Era" plan, found in HOARD'S DAIRYMAN, with but slight alteration. The one number from which I obtained this plan, saved me fifty times the subscription price of the DAIRYMAN.

Now, in this connection I would be pleased if some of your many readers will donate a plan for a small creamery building, the machinery and furnishings necessary, and the placing of the same as regards convenience in operating; also their experience in butter making in private dairy as against sending their whole milk or their cream to the factory.

I shall keep from 20 to 25 head of special-purpose cows (butter cows) and hope to profit in the future, as in the past, by putting into practice the teachings of the DAIRYMAN, as regards increasing the fertility of my soil, by having the manure spread daily on the fields. In this connection I wish to ask as regards fertilizing. There is quite an accumulation of bones around the slaughter houses in this vicinity; is the value of such fertilizer such as would warrant the trouble of gathering them? I now have a 2-horse power engine with which I intend operating creamery machinery. I also have before me a catalogue and price list from Wilson Bros., which quotes a No. 3 mill well suited to 1, 2, 3 or 4 horse power that grinds dry or green bones, corn on cob, small grain of all kinds, price $60, with a good per cent off. Do you know of this machine, or if any of your readers have used them, will they please report?

Now, Mr. Editor, if all of the foregoing should be consigned to the waste basket, please give me a balanced ration from the limited kinds of feed stuff: Wheat bran, weighing 25 pounds to the bushel, wheat shorts weighing 40 pounds to the bushel, $10 and $12 per ton respectively; wheat chop $18; barley $22; oats $22; no corn nor oil meal. If the purpose of the oil meal is to keep the bowels open, it is not needed, as I feed all the oat hay they will eat. After feeding grain, this has the required effect.

Colfax, Wash. C. O. C.

Although we have cut out several paragraphs from our friend's communication, there remains an "embarrasment of riches." In this hurrying, touch-and-go age, readers all too often skip the long articles. Of course they are the only losers thereby, but, all the same, we have too much reason to regret their loss. Short, crispy correspondence and articles add to the reader's estimate of the value of a paper, and if the above had been given in three letters, it is safe to say it would have found three times as many *interested* readers, and thereby accomplished more than three times as much good.

The one item about building a barn on the "New Era" plan, given in this paper some two or three years ago, and re-published last year, ought to lead thousands of other readers to studying the barn plans and other suggestions which are given from week to week in our columns. And it ought also to set more subscribers into the habit of saving the successive numbers as they are received. We furnish a specially made binder for this purpose, at the small cost of 75 cents, and any volume of HOARD'S DAIRYMAN, with its accompanying index thus preserved, will prove itself worth many times its cost, every year.

We believe it would pay well to collect and grind these bones, especially if they could be composted for four to six weeks with dampened wood ashes. There are many mills for this purpose, and it would be unfair to the others for us to commend one to their exclusion. We could not, if we would, try every machine that is put upon the market, and if we could, the merits of several are so nearly equal, and human judgment so fallible, that we should hesitate to offer specific advice. And further, the man who has the good sense not to be deterred from getting the best bred dairy sire he could find, notwithstanding the attendant "long price", can be safely left to his own discretion in buying a grinding mill. As a general rule it can be safely stated that the lowest priced bulls, the lowest priced machines, and the lowest priced seeds and feeds are not necessarily the cheapest.

Wheat, barley and oats at the prices given are out of the question, when good bran and shorts are to be had at about half the cost. For mature cows giving a full supply of milk, we should feed from 8 to 12 pounds of a mixture, half bran and half shorts, *by weight*, the amount to be determined by the way each animal disposes of it. Those that turn any part of the feed into body fat are receiving more than is profitable to feed a dairy cow. We do not object to feeding for growth, but for excess of fat.

Chicago Milk Supply.

ED. HOARD'S DAIRYMAN:—Two out of every three milk shippers we meet, ask some question about the "milk trust", which has received so much free advertising, recently in Chicago papers, especially the *Chicago Record*, which recently gave one of its financial columns to publish a prospectus of this new trust.

In the light of recent events, and knowing what we do about the so-called "trust", we are surprised to see the *Chicago Record* giving so much space to something that has turned out to be an ignominious failure, without apparently investigating it more fully than it did.

And, now that the options on the business which were to have formed the nucleus of this "trust" have all expired, and the organizers have all disbanded, we are surprised to hear the shining lights of the Chicago Milk Shippers' Union announcing, at their annual meeting, that the organizers of this trust are still hard at it, and urging the farmers, therefore, to closer organization and the prompt payment of larger annual dues.

In order to explain more fully some of these questions, let us repeat what, to the initiated, may seem like ancient history. For several years there has been an organization in Chicago to which most of the large dealers have belonged—we will not give names, as it would be betraying a confidence, but we know, personally, a majority of the members, and we know, further, that after their monthly meeting preceding the first of May and November of each year, each member sent his farmers a price for milk for the following six months, and these prices in every case were similar.

Some of the members of this association met on the street about two months ago and commenced to talk about the price of milk for the summer, and before they left it was agreed to meet in one of the parlors of the Palmer House to talk over plans for mutual protection and advantage. Shortly after this, Mr. Leiter was introduced—whether by his own request or the request of these dealers, we have been unable to learn—and a scheme embracing the consolidation of these concerns was planned. As there are numerous meetings at this hotel, the news reporters of the Chicago papers keep in close touch with the hotel clerk and tell of such meetings and of course the reporter noses around and and sees who is in attendance, guesses a good deal and writes a column or so for his paper. Thus was the so called "milk trust" conceived and announced.

One of the purposes of these meetings was

EVERY SUCCESSFUL farmer who raises fruits, vegetables, berries or grain, knows by experience the importance of having a large percentage of

Potash

in his fertilizers. If the fertilizer is too low in Potash the harvest is sure to be small, and of inferior quality.

Our books tell about the proper fertilizers for all crops, and we will gladly send them *free* to any farmer.

Diagrams with full descriptions of Poultry houses. All about **Incubators, Brooders** and thoroughbred Fowls, with lowest prices. Price only 15 cents.
C. C. SHOEMAKER, Box 867, Freeport, Ill.

to get ahead of a competitor who had become notorious for cutting prices; but when it was announced in the papers, a little inquiry revealed the place of meeting and, we are told, the surprise was great when he walked into the meeting one day without invitation or even knocking at the door, and one of the causes of the abandonment of the scheme was lack of confidence in this dealer.

The other cause was the lack of financial aid from the public. That is, it looks as though Mr. Leiter thought that the fact that he had lent his name to this combination, that the "dear public" would "fall over themselves" to purchase stock in the new company, which was to have been known as "The Chicago Milk Company." But the public—at least some of them—had been led astray by Mr. Leiter in a wheat deal, recently, and consequently they did not subscribe for this stock as freely as might have been expected. One objection was that the firms represented controlled only about one-eight of the business, and the great question was, how was the other seven-eights to be brought into the company. The stock was then pulled off the market with the explanation that they intended to get a controlling interest before trying to sell more stock. A few days after this the options on the several milk companies expired, and thus the so-called "milk trust" fizzled out.

* * *

We understand there is some dissatisfaction in the ranks of the Milk Shippers' Union on account of some of the directors desiring a new president and also a new secretary. It is not our intention or desire to throw any cold water upon this organization, but it is to be deplored that the present officers have not succeeded in getting a larger representation of shippers to join their ranks. It looks as though some one connected with the present management was very unpopular.

We understand from some of the milk solicitors of our acquaintance on the various railroads carrying milk to Chicago, that some of their shippers who joined one or two years ago, have failed to pay their dues to continue their membership and now claim they will have nothing to do with the concern.

* * *

The price of milk for February was from 75 to 90 cents per 8 gallon can.

Chicago. THE INSPECTOR.

Creamery Questions—Skimming Stations—Summer and Winter Patrons.

ED. HOARD'S DAIRYMAN:—In buying cream by the Babcock test, what per cent should be allowed for overrun?

2. Will cream that has been pasteurized make as much butter as raw cream?

3. Will butter made from pasteurized cream keep as well as from raw cream?

4. Is it considered as good butter or better, or how does it compare with butter made from raw cream, I mean not pasteurized but properly ripened?

5. Will composite samples that have been preserved by bichromate potash test as high as the fresh milk?

6. What per cent water should good butter carry?

7. Will some one of those operating skimming stations state how they operate them? Do they ask the patrons to put them in or does the proprietor of the creamery put them in and then ask a pledge for so much milk to be furnished?

Now I would like to have a chat with brother creamery men.

Do you run your creamery the year through? If so, do you have any falling off in winter season? If so, how do you arrange with them? Do you allow them to come in on the same market in the summer season? I would like some arrangements by which I could make a just difference. I have retail jobbing trade for my butter that I must supply in winter as well as in summer, and this inflow of patronage in summer gives a large excess which must go to commission market; and as I charge so much per pound for making and selling, it cuts the price to my regular patron and this I wish to remedy. Any light I can get on this or any rule for governing will be a favor. B. H. A.

Mercer Co., Pa.

Our correspondent's questions if answered in full would make a short treatise in dairying and take more room than we can spare at present; consequently the answers must be rather brief.

The question of overrun is more theoretical than practical. The average is about 15 per cent, but in practice it may vary two or three per cent above or below this point, according to conditions in the creamery and quality of milk. It is far better to credit a patron with exactly the amount of fat he brings to the factory and divide the proceeds according to the actual weight of butter made, than to figure on a theoretical overrun.

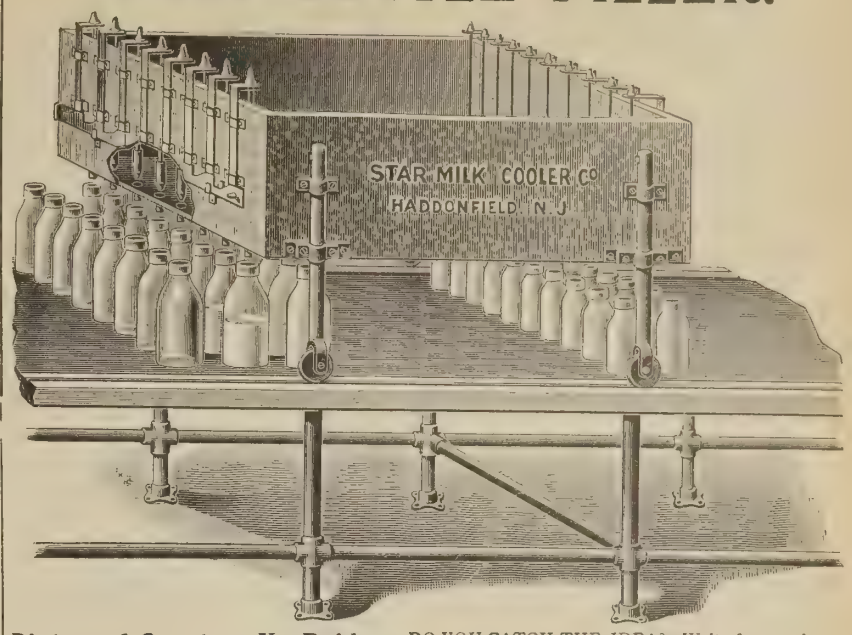
2. Pasteurized cream will churn as close as raw cream. The advantage, if any, is in favor of the pasteurized cream.

3. Tests indicate that pasteurized butter keeps better than raw butter.

4. The quality of the two depends on the market. Danish butter that is nearly all pasteurized, ranks higher in the English market than the unpasteurized goods.

5. If your composite sample is thoroughly mixed and a correct sample taken there should be no difference between the two tests.

6. Good butter should contain not over 15 per cent of water.



The Cows Enjoy It.

ED. HOARD'S DAIRYMAN:—Enclosed find $1 for a renewal of your paper "The Gospel light to Dairymen." I find it would be down hill work to do without it. When I first began to read it, it turned me "about face" to the cow. I keep a few high grade Jerseys and get from 300 to 350 pounds of butter per cow and they seem to enjoy the paper as I do when I read it to them. I may send you a statement later on what my cows have done for me for four years or more. Yours for the DAIRYMAN.

Vermontville, Mich. WALTER NAGLE.

Seasonable Notes From Michigan.

City Milk Trade—Beef and Butter—Ensilage—Root Growing.

ED. HOARD'S DAIRYMAN:—Something which tends to take the charm from the retail milk trade is trying to make the trips on mornings when mud, snow and slush is a foot or more in depth, wheels clogged until they resemble those of a chariot, and snow and sleet blowing at a rate of "forty knots an hour." Surely this is delivering milk under difficulties such as only those who have "been there"can appreciate.

One of our local milk routes is conducted by a woman, and a success she is making of the business too. Her up-to-date wagon makes its rounds every day driven by a milk maid who serves her customers in a most gracious and satisfactory manner. This is an innovation for this part of the country, yet it is one which need startle nobody in these end-of-the-century days.

It is a most respectable and suitable calling for a woman I am sure, and the share of public patronage bestowed upon the young woman in question speaks well for the manner in which she is received. The fashion may well be extended. It might prove a drawing card in places where nothing of the kind has been introduced heretofore. Patrons would be likely to have confidence in the product of a dairy presided over throughout every detail by a woman.

One feature of the retail milk trade which impresses me most forcibly in regard to our own city, is the change which has been witnessed within a year or two in the manner of delivery. Formerly less attention was paid to appearance and some milk wagons might have been seen which were actually filthy from long use and insufficient scrubbing, to say nothing of mud covering their exterior the year around. All milk was carried in tin cans holding from eight to ten gallons and ladled out to customers by the quart, after the old rule.

Now all that is changed. We have modern wagons, neatly painted and kept clean outside and in. Milk is bottled at the farm and delivered in neat wire baskets. Most dairies have coolers and a first class product is guaranteed. Nearly all dairy herds have at least a proportion of Guernseys or Jerseys.

To me it is a most encouraging sign of the improved and advanced ideas, now prevalent, to see these and other changes which are taking place in this most important industry.

Dairy cows seem to be in good demand and are bringing fair prices. Beef has another inning and many farmers are on the lookout for the cow that will make beef when she gets too old to make butter profitably.

There is fierce rivalry in discussing this subject between the dairy specialist and the dual-purpose cow advocate. Talk you ever so long and argue ever so forcibly it is impossible to convert either to the other's way of thinking.

The drover who drives about the country buying fat stock will tell you the Jersey has been a great injury to farmers, while the dairyman will tell you they have been a corresponding great benefit.

At our recent Round-up Farmers' Institute, at Pontiac, there was considerable discussion between the beef and the butter men. One successful dairyman stated that he had fattened a good many steers in the past, but should never do it again, while the same feed required to make one pound of beef would make a pound of butter. He had demonstrated to his own satisfaction the possibility of doing this. This gentleman is loud in his praise of ensilage as a food for milch cows

In the discussion upon silos and ensilage, one dairyman gave figures relative to the cost of ensilage. He has weighed the corn as it came from the field to the silo, and keeping careful account of all expense, puts total expense of growing, cutting, hauling and siloing the product at forty-six cents per ton. Certainly this is furnishing rations for the cow pretty cheaply.

One man who has had large experience in growing roots, gave, at an institute this winter, his method of growing them. He has made the subject a study, and figures to produce the crop at least possible cost. The soil is plowed deeply in the fall and again in the spring. It is made very fine and gone over several times at intervals of a week to kill the weeds, as fast as they sprout.

The variety of seed chosen is the Golden Tankard. They are put in rows 22 inches apart. When nicely up they are thinned out by means of a sharp hoe to about eight or nine inches apart. Frequent cultivation is given during the summer, and when the harvesting time comes, a rather novel method of procedure is gone through with. Men armed with sharp hoes go through, and with a single stroke sever the top from the root of each plant. A low wagon with rack follows (the rows being so spaced that the wheels pass between them) and men with wide forks pick up the tops. These are carried to the barn and fed to stock. The roots are then pulled by hitching a team to a 60-tooth drag, and going over the field crosswise of the rows. As those familiar with this variety of mangel are aware the Golden Tankards grow well above the surface of the ground, and this mode of pulling them is said to work finely, but very few being broken off.

This gentleman does not cut roots for any stock, but feeds them to cattle, sheep, hogs, horses and fowls, whole. The animals bite pieces out to suit themselves, eating them readily in this way, and of course the fowls know how to dispose of them in their own way. W. C. ROCKWOOD.

Mich.

The Use of Commercial Fertilizers on the Farm.

The Results of Years of Experience with Them.

ED. HOARD'S DAIRYMAN:—Noticing from time to time in the DAIRYMAN inquiries made in relation to the use of commercial fertilizers on the farm which the Editor does not answer from the fact that this excellent journal is published in a favored part of the country, where these aids to productive farming are not needed; but also taking into consideration that its circulation is not local but continually widening, embracing a goodly portion of the United States and extending over into the British Provinces, it will be seen at once that within this large and diversified territory, the conditions are not the same in Wisconsin as some others of the Western states.

In New England and the older Eastern states the manurial resources of the farm are not often sufficient for the demands of the soil and crops, and to this fact may be attributed the large use of commercial fertilizers. These are not generally used to take the place of farm manures, but to supplement and extend them for the purpose of getting larger returns in crops.

Every farmer should endeavor to make all of the manure possible and use it to the best advantage on the crops, as this is of the greatest importance, but having done this, if the conditions are such that the supply is not sufficient for the best results, then it will be advisable to use some form of fertilizer, to an extent that will be found to pay good returns for the investment. But considerable judgment and experimenting will be found necessary to enable the farmers to determine to what an extent this can be profitably employed in his land.

Experimenting on a small scale with different crops and on different soils, making use of such forms of fertilizers as he has reason to believe will produce good results, will not be expensive nor very difficult to do.

There is a wide range of reliable fertilizers and fertilizing materials from which to select, embracing that known as "complete fertilizers" as those containing proper amounts of nitrogen, phosphoric acid and potash, special fertilizers formulated for different crops, or any of these ingredients where they may be wanted.

Also For Sale—Children's Ponies and registered Shropshire Sheep. MILLER & SIBLEY, Franklin, Venango Co., Penn.

rules in this matter, even if I were able to do so, but simply as a practical farmer, having used commercial fertilizers for twenty-five years or more—mostly standard superphosphates—as these seem to be well adapted to my soil, will give some of my experience with them, thinking it might be of benefit to others.

The soil of my farm is largely a gravelly loam, underlaid with hard pan and somewhat stony. The meadows are almost entirely arable land and require to be plowed every few years and devoted to cultivated crops, then seeded to grass in which to remain three or four years. To secure good crops, manure, or fertilizer, must be used, as on seeding again to grass the land should be in good condition. As there has not been during this time sufficient manure for this purpose, recourse was had to the standard superphosphates, which, as a general thing, have produced excellent results. These have been used on almost all crops raised.

For potatoes, we use three hundred pounds per acre in the hill of "potato fertilizer"—that is a form of phosphate containing more potash than that used for corn. Sometimes at the last cultivation, wood ashes, or these mixed with phosphates, are applied and worked into the soil. Use no manure with this crop and usually get good yield and quality.

If more fertilizer is needed, it should be spread broadcast and harrowed in lightly previous to planting, and then place some in the hill or drill.

For years we have grown a large amount of fodder corn to feed without husking—now have a silo—and have done this entirely with superphosphates. Plant on sod turned in fall, using three hundred pounds to the acre in the hill, the work being done with a planter. This is all of the fertilizer used and for many years have averaged excellent crops and at a small cost. Otherwise the crop is well cared for, but without the aid of the hand hoe.

If the corn were to be husked, would prefer a moderate amount of manure spread broadcast and harrowed in, with two hundred pounds of phosphate in the hill. This, with us, brings good returns.

Following the corn and potatoes, the land is sown to barley and oats, and seeded to grass. With these crops the farm manure is used. If there was not sufficient manure for this purpose, would use less—that is, make it go farther—and supplement with a moderate amount of fertilizer. Superphosphate will be found a great aid when seeding to grass, giving the young grass a vigorous start.

Where oats are sown on green sward or rough land that it is desirable to subdue, and there is no manure that can be spared for the purpose, these phosphates will be found to produce good results.

If on seeding to grass along with a grain crop, especially oats, farm manure is found to produce too rank a growth of straw, causing it to lodge badly, as is sometimes the case on alluvial soils, then I think it would be better to use phosphate when seeding, which will serve to produce stronger straw, thus keeping it from lodging and killing out the grass, and then spread on the manure soon after harvest. This will protect the grass, stimulate its growth and tend to a larger production of hay.

I have obtained good results simply from sowing broad cast 100 pounds of superphosphate to the acre, early in the spring, on grass, repeating the same for several years. This was on hard-pan soil, and somewhat moist. Calculated I got one-half ton of hay extra for this hundred pounds of fertilizer.

Where this is done it should be while there is a good stand of grass on sod, as it will be found difficult improving the product of a run out grass field with fertilizer or manure—such land should be plowed and cultivated to other crops, after which it can be re-seeded to grass again.

I have given here some of the results of my own experience with commercial fertilizers, hoping it may be of benefit to those readers of the DAIRYMAN who desire information on this subject, but the farmer should try for himself, and can, in this way, soon find whether they can be profitably employed on his own lands. E. R. TOWLE.

Franklin Co., Vt.

Gasoline Engines in the Dairy.

ED. HOARD'S DAIRYMAN:—In answer to Mr. W. C. Hughes' inquiry on page 1039 of February 3rd.

In regard to the danger of running a gasoline engine, with proper care there is none whatever. I am past three score years and have farmed all my life and run a dairy for twenty years. I have used coal oil in the dairy, gasoline and steam engine.

The coal oil engine did not give satisfaction. The gasoline engine will not give steady motion, and for that reason will not make a good separation of the fat from the milk, on account of causing the bowl to vibrate and run unsteady and sometimes getting the bowl out of repair.

The steam engine with a good governor will give you the smoothest and steadiest motion of any power I know of. When you are through separating and churning you have steam left to heat water for washing purposes. If you have the boiler larger than the engine proportions you would not have to attend to the fire as often, besides you might want to use it for cheese making.

DUNCAN MCKINNON.

Monterey Co., Cal.

Silage and Pure Milk.

ED. HOARD'S DAIRYMAN:—In looking through "Note and Comment," in the issue of February 10, on page 1060 of your paper, John Gould says in his Institute travels, among other things in speaking of silo talk:

"And with the backing of Geo. Abbott, the largest and most critical buyer of Philadelphia, that milk from silage was his best milk and such as he could certify to, the proof that silage was one of the best things about the barn, was not often challenged"

Now, Mr. Editor, in this vicinity there is a good deal of silage fed to dairy stock, and has been for the last few years. I feed between four and five hundred tons a year and as yet, have not had any complaints or fault found with the milk, but I have just been informed that some of the farmers who feed silage, and who send their milk to a creamery of considerable note, have been notified that after such a date their milk will not be taken at the creamery, as they, the company, are not going to handle any more milk made from silage fed cows.

Now here are two concerns handling milk. One claims that their best milk comes from the dairies where silage is fed, and the other does not want any milk from silage fed cows.

Now, I do not doubt in the least that Mr. Abbott is correct in his statement, and that he receives just as good milk from dairymen who feed silage, and also believe that the other parties have some cause for not wanting milk from dairies where silage is fed.

There must be something more than difference in opinion in this case. There must be a difference in the surroundings of the herds in this vicinity. I think too many dairymen keep their cows in too close quarters to make the best of milk, and then there is a great difference in silage. The quality depends somewhat on the time it is cut and put into the silo. The farmer who has to depend on the man who goes from farm to farm with his power and cutter, has to take it when it comes his way, and it may be two weeks before the corn is at its best, or it may be so late in the season that it is injured by frost and being over ripe. So the farmer cannot always control his silo filling just as he would like. Large farmers have the advantage by having their own outfit, and being able to do their work at the right time, and keeping their stock in a better condition for making good milk.

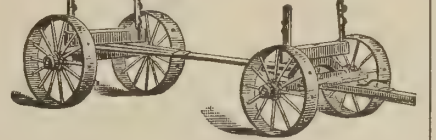
In many cases the silo is located too near the cows, so that they are constantly inhaling the odor from too sour silage, and in too many cases the farmer is afraid his cows will get too much fresh air and out-of-door exercise.

I believe in all the fresh air possible with prudence. I dislike very much to detect, on going into the stable, foul odor, and if I do detect any, I make it a rule to air out, as the good house keeper would say. Give the cows at least an hour or two of exercise in the yard every day when the weather is fair, and take this time when the cows are in the yard to air the stable and clean it up. Do not leave in the feeding floor in front of the cows, over night, or any time when the stable is closed, any cabbage, fodder, or turnips, or anything else the odor of which the cows will inhale, especially in air tight barns, the flavor of which we do not relish in the milk.

If we would only pay more attention to the comfort of our stock than the getting of a large quantity of milk made by unnatural conditions, we would hear less about poor milk from silage fed cows. I believe we should keep our animals in warm, clean and well ventilated stables, as free as possible from all odors, and with a reasonable amount of out door exercise. Our cows, if well nourished, will be healthy and in a better condition to give good, wholesome milk.

Worcester Co., Mass. E. A. H.

Guernsey Cattle Interest.



ED. HOARD'S DAIRYMAN:—The reports of the Secretary and Treasurer of the American Guernsey Cattle Club submitted at the recent annual meeting of the club showed a marked increase in the number of animals placed in the register for the breed, and also in the sales recorded. As compared with previous years, the work has nearly doubled in the last five. A committee from the club has been chosen to formulate plans for increase of office accommodations and safe storage of the records. This committee will report at the next meeting of the club

The first year's home tests of Guernseys, under the auspices of the club, are now well under way, and some very interesting results will be obtained. Twenty-one cows are competing for the herd prizes, and five cows in the single cow test. These are owned by Geo. C. Hill & Son, Rosendale, Wis.; Levi P. Morton, Rhinecliff, N. Y.; Ezra Michener, Carversville, Pa; and Jas. H. Beirne, Oakfield, Wis.

The January issue of the *Register*, which is published in quarterly parts, has four illustrations of Canadian and Island Guernseys that have become noted for their excellent record in the show ring and in breeding. WM. H. CALDWELL.

Farm Wagon for only $19.95.

In order to introduce their Low Metal Wheels with Wide Tires, the Empire Manufacturing Company, Quincy, Ill., have placed upon the market a Farmer's Handy Wagon, sold at the low price of $19.95. The wagon is only 25 inches high, fitted with 24 and 30 inch wheels with 4 inch tire.

This wagon is made of best material throughout, and really costs but a trifle more than a set of new wheels and fully guaranteed for one year. Catalogue giving a full description will be mailed upon application by the Empire Manufacturing Co., Quincy, Ill., who also will furnish metal wheels at low prices made any size and width of tire to fit any axle.

AYRSHIRES Finely Bred and from the very best families. Stock young and old for sale, bred for milk and butter qualities. Also fine herd Chester White Swine. Correspondence solicited. FRED TSCHUDY & SON, Monroe, Wis

Babcock Tests vs. Churn Tests.

ED. HOARD'S DAIRYMAN:—In reply to recent inquiries on this subject, Prof. W. A. Henry, of Wisconsin Experiment Station, Madison, Wis., writes to me as follows, under date of December 27, 1898:

"Replying to your inquiries, will say: First, without being able to prove my statement, but basing my judgment on the results of the most carefully and fairly conducted dairy tests, I believe that most of the records showing thirty pounds or more of butter in seven days are unreliable. I do not affirm that the parties did not get thirty pounds of something which they called butter, for the seven days, but I am firmly convinced that a large part of these so-called records were not honest, merchantable butter. I believe that private tests with dairy cows, and those where the milk and butter are not analyzed, are no more reliable than private trotting tests would be with horses, for human nature is the same in the owners of both these animals. Second: I believe that the Babcock test together with the scales combined gives us a far more correct method of estimating the butter capacity of a cow than the churn itself. This is true, because with these two instruments we can determine the total quantity of fat yielded by a cow in a given time, and when a cow has produced this fat she has done her part and is entitled to full credit. The churn is not a measure of a cow's butter productive capacity, because fat may be lost both in separating and churning, and the cow cannot be held accountable for either of these losses. Again, unless the butter is analyzed, it may not be a merchantable product, for which fault again the cow is not to blame, nor on the other hand should she have credit for water, casein, extra salt, or all of these, which the worker through his desire for a large production may leave in excess in the butter. Of course the Babcock test can be wrongly used, or it can be misrepresented, but with the scales it forms the simplest and most direct combination for measuring a cow's butter value. A man, who will cheat with the churn, will also cheat with the Babcock test, but the skimming device and the churn may both cheat the cow, when the man or the committee are honest. This the Babcock test will not do. By means of properly conducted official tests, and the use of the Babcock test, the representatives of our various breeds of dairy cattle are in a position to establish records which are reliable, and in time will become immensely valuable, as data accumulates and the effects of breeding and selections are realized."

This letter should be in the hands of every dairyman and every breeder of dairy cattle. Before the invention of the Babcock test, the churn was the only practicable means for testing cows within the reach of dairymen. It is probable that the earliest tests did not give full credit to the cows. As strife for extraordinary records grew there seemed to be no end to the number of pounds that might be reached. One record passed 46 pounds in seven consecutive days; the cow and the whole process of making was in the hands of an intelligent committee. The World's Fair threw a great light over such records. Cows that had been credited with 30 pounds and upwards, under most favorable conditions at that fair failed to make 20 pounds of butter of 80 per cent fat in the ordinary period of seven consecutive days. It was a great surprise. The public lost all confidence in the great records that had been reported. If these tests had no other effect they were not altogether vain.

With view of finding out how some of those great records might have been made, I took a quantity of rich cream, properly ripened, and churned it at a low temperature until it reached the point described by the word "broke". If it had been chilled it would have been about as dry as snow. An enthusiastic record maker might have reasoned in this way, "It is not cream, it is not buttermilk, therefore it must be butter." I estimated its weight 46 pounds and it contained 33 per cent fat. I added ice water and again started the churn. When it appeared as granules about the size of wheat, I drained off the buttermilk and let it stand draining several hours. No one, not a practical butter maker would have had suspicion that it contained an excess of moisture. It weighed 18½ pounds. By chilling it still more it might have been salted without loss of weight.

A thoroughly conscientious man, unfamiliar with butter making, might have readily endorsed this weight as the correct one of a merchantable product. I warmed it up, salted it, and found it produced 11 pounds of merchantable butter. It would make all the difference in the world whether a cow had a record of 18½ pounds or of 11 pounds, or double these figures, 37 pounds in seven consecutive days, made one way, or 22 pounds made another way. I do not pretend to know other ways, doubtless more fraudulent, by which great records may have been made. But I know butter by the churn is an indefinite quantity. In the light of the present we can put comparatively little value on records made by it.

The following letter recently received by our firm, shows that there are some persons who are willing to instruct others in the mysteries of making large records by the churn.

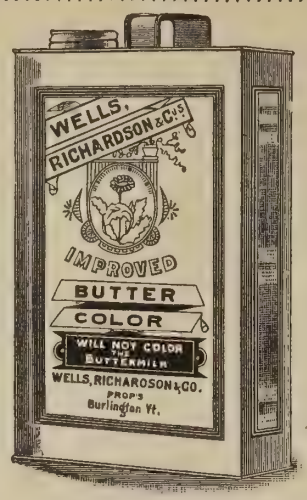
TORONTO, January 9, 1899.

"Messrs. A. & G. Rice, Dear Sirs:—We have fitted up the dairy of Mr. ——, of Toronto, with our new process of butter making. It is giving very satisfactory results. We can guarantee 25% better returns, a simpler process, more certain in results, better butter, a purer butter, less casein and water, and better keeping.

We work from 25% to 30% above the Babcock test. These advantages are important to you. We invite investigation, and can refer you to ——, who has kindly consented to your making any test you like, with either his cream or your own, and we suggest that you bring one week's cream of any cow you prefer, and that you have made previous tests of, and see what our process will turn out, or any other test you may wish. We use no chemicals or foreign material. We sell nothing, but work on royalty. Shall be pleased to give you any further information. Yours truly,"

At the same time we must not be too severe in our judgment of earlier churn records. Most of the cows are now dead, and we have no other means of getting at their worth. Many of them were great cows. Just what records to discount, and to what per cent, can never be known. But the farce of making records of 30 pounds and upwards is ended. The Babcock test is of wonderful accuracy, yet simple in its operation. No valid objection can be raised against it. What shall we say then, of those who would continue the old game of reporting churn tests. Be the records great or small, they are no longer worthy of attention, and it seems to me an insult to their readers, for our papers to publish them. It is difficult to overvalue official records made with the Babcock test. Prof. Henry points out the reason why, in a single sentence:

"By means of properly conducted official tests," he writes, "and the use of the Babcock test, the representatives of our various breeds of dairy cattle are in position to establish records which are reliable, and in time will become immensely valuable, as the data accumulates, and the effects of breeding and selection are realized."



Curries, Ont. GEORGE RICE.

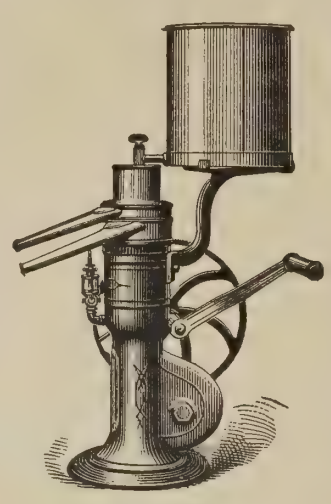
Inbreeding.

ED HOARD'S DAIRYMAN:—Question No. 7, page 1032, in DAIRYMAN of Feb. 3rd, brings to my mind recollections that may be of interest to some reader of your valuable paper. You are at liberty to abbreviate, or to ignore entirely without creating any "onpleasantness."

Nearly thirty years ago it was my good fortune to form an acquaintance with a most enthusiastic breeder of Jerseys, Mr. Wm. H. Hopkins, of Providence, R.I.,—now deceased—and here let me pay deserved tribute to his memory by saying that it is good fortune for any young man to form the acquaintance and possess the friendship and respect of one of his nobility of mind and character.

Beginning with the imported bull, Comet, No. 130, A. J. C. C. H. R., and cow, Theresa, No. 1919, Mr. Hopkins bred these animals and their descendents incestuously, according to his own ideas, and for the purpose of experimenting. On one occasion, having in mind the sale of Walcott & Campbell's New York Mills herd of Short-horns, where the highest price realized was $40,600 for a single cow, he remarked to the writer:

Always Use the BEST.



The temptation to try a cheaper article in manufacturing high grade goods is such that the experiment is often undertaken and results generally in producing an inferior article.

High grade butter needs the best of appliances and skill and particularly the best Color.

WELLS, RICHARDSON & CO.'S IMPROVED BUTTER COLOR

has maintained its reputation as the best. It is always reliable and gives the true June shade.

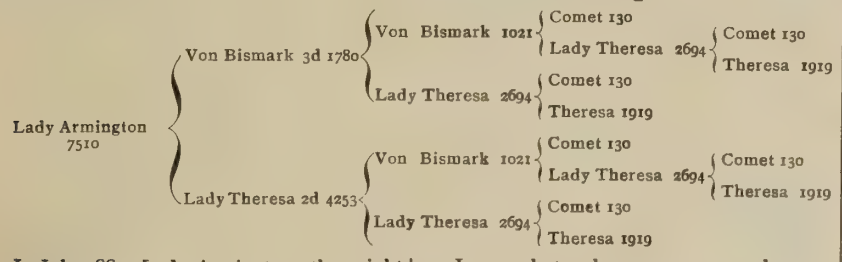
Modern Dairy Practice By... GOSTA GROTENFELT, President Mustiala Agricultural College, Finland. Authorized American Edition by Professor F. W. WOLL, with Illustrations. Second Edition. 291 pages. 12 mo. Cloth. $2.00.

JOHN WILEY & SONS, 53 E. 10th Street, New York City



"I am going to breed a forty thousand-dollar cow, or bust something."

My observations of his herd were frequent, and for a time there was steady improvement in the dairy form and capacity of the cows. The type and color of the animals became fixed, the latter invariably a squirrel grey, with more or less white. But the tendency to fineness of bone and delicacy rapidly increased, and finally the calves were born extremely weak and frail, and some of them had not sufficient vitality to live, even under conditions and care most favorable to their comfort and strength.

Being a sufferer from paralysis, and only able to get about upon crutches, and with the aid of an assistant, did not prevent Mr. Hopkins from giving daily attention to his large business interests in the city, or seemingly detract in the least from his zeal as a "farmer," as he always delighted to style himself.

In the spring of 1877, he wrote: "Are you going to Fitch's sale? I have gone just as far as I dare to" (meaning in in-breeding his animals) "and I want a bull to go with my Theresa. I cannot attend myself, and I want you to select one for me."

In compliance with this request, I purchased a yearling bull, afterward registered as "Admiral Farragut, No. 2666; sire, Pierot 2d, No. 1669; dam, Myrtle 2d, No. 211." A most fortunate selection, as results proved. One of the most incestiously bred cows was Lady Armington No. 7610, bred as follows:

In July 1885, Lady Armington, then eight years old, was given a test for 7 days, with following result: Yield of milk 200 lbs.; yield of butter 17 lbs. 8 oz.

One month later, Beauty of Seekonk No. 14651, another daughter of Lady Theresa 2nd, 4253, sired by Admiral Farragut, No. 2666, was given a test of one week, at the age of 4 years 5 months, with following results: Yield of milk 251 lbs.; yield of butter 21 lbs. 3 oz. Individually, and in the dairy, this cow out-classed her incestuously bred half sister.

Nothing could ever induce Mr. Hopkins to part with a female of the Theresa family, and this herd numbered about thirty females. It was his purpose to make numerous tests as the conditions favored, and the result of these trials would have been most interesting and instructive, but in March the following year, 1886, an incendiary fire destroyed this herd, together with as many more choice thorough-bred Jerseys and the magnificent barn in which they were stabled.

That Mr. Hopkins was a good feeder is shown by a quotation from a letter informing me of the fire: "Your bull," (one purchased from me as a calf a year previous to the fire, and burned with the others) "weighed the day he was a year old 665 lbs. Admiral Farragut, when we got him from Fitch (about 13 months old) weighed 365 lbs., yet he weighed over 1800 lbs. before we killed him." L F. AVERILL.

Windham Co., Conn

Hand Separators—Experience Wanted.

ED. HOARD'S DAIRYMAN:—I would like some information from anyone who has had experience with hand separators and creameries.

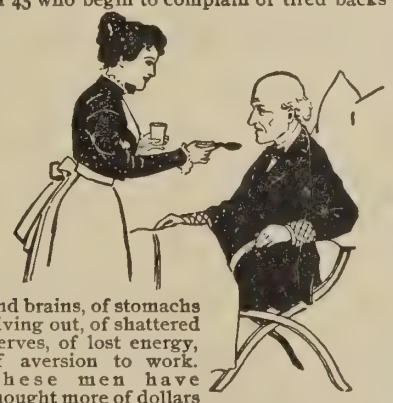
We can send our milk to a creamery, but on return it is found to be sour and unfit for calves. We have therefore been contemplating buying a separator, if the experience of those who have done both ways would justify our doing so.

We like the paper very much and cannot see how anyone engaged in dairying could get along without it. R. M. G.

Black Hawk Co., Iowa.

An Inbred Connecticut Herd.

ED. HOARD'S DAIRYMAN:—Among the queries in the DAIRYMAN of Feb. 3rd, I find there are some that my experience enables me to throw some light on. Beginning with No. 4. Some twenty odd years ago I was milking seven or eight common stock cows. I bought a thorough-bred Jersey bull calf, and a heifer that was fifteen-sixteenths Jersey. These calves grew up to be treasures. The bull I foolishly killed when he was two years old but was lucky enough to supply his place with another good one. From the first, I saved heifer calves from my best cows and after four or five years I got to saving a bull calf if one of my best cows dropped one. I have bred in and in, bred sires to their own daughters, and one of the best veterinarians in Connecticut, after looking at my little herd of ten cows, reported in Hartford that I had the best lot of Jerseys in Connecticut. I had not told him that there was not a registered animal in the lot.



Not being registered, only the promising calves were saved, and some of these went to the butcher as yearlings. When they came in at two years old they had to make at least a pound of butter per day, and no general-purpose cow making butter and taking on fat at the same time got to be an old cow, she was allowed to take on all the fat she would as soon as possible.

We sell only butter and cream, and occasionally find a heifer giving a large amount of milk not quite up to our standard. I get good prices for such cows from some gentleman that wants a genteel looking family cow that will supply him and two neighbors with pretty good milk. I have not bought a cow in the past twenty years and my advice to a farmer would be not to change breeds if he was breeding what he wanted. If I took a notion to breed working oxen I should sell my Jerseys, but so long as we can have a handy market for all the butter we can make at 30 cents and for all the separated cream we dare spare at 40 cents per quart, some one further from market can raise oxen and general-purpose cows. R S HINMAN.

New Haven Co., Conn.

PREMATURELY OLD.

A man ought not to *feel* old, or to *be* old until well up towards the nineties, but now-a-days you don't see many such men. Instead, you hear people no older than 40 or 45 who begin to complain of tired backs

and brains, of stomachs giving out, of shattered nerves, of lost energy, of aversion to work. These men have thought more of dollars than of health. They forget that money is almost worthless without health to enjoy it. If men and women will take Dr. Pierce's Golden Medical Discovery, they needn't worry much about old age. The years will go by, but they won't show it. This medicine makes digestion perfect, and changes a disordered stomach into a healthy one that works as Nature intended. It regulates the liver, enriches the blood and tones the nerves. It prevents consumption by curing bronchitis, lingering coughs and bleeding lungs. The "Discovery" contains no alcohol; no false or uncertain stimulus; the power it gives is the power of Nature: deep, genuine and lasting. It does not create a craving for stimulants. In serious cases of sickness, Dr. R. V. Pierce, Buffalo, N. Y., will give free advice and counsel to those who write him.

"The reason I delayed writing was because I wanted to wait *one year* after I had taken the medicine before giving my statement, and now I can send a good, conscientious testimonial," writes Chas. H. Sergeant, of Plain City, Madison Co., Ohio. "During the summer and fall of 1896 I became all 'run-down,' nerves and stomach were out of order. I wrote to Dr. Pierce for advice. He said I had general debility, and advised Dr. Pierce's Golden Medical Discovery, and I used six bottles. Since I stopped taking it about one year ago, I have not taken any medicine of any kind, and have been able to work every day. My appetite is good, I can eat three square meals a day, and I do not feel that miserable burning in the stomach after eating."

QUAKER DAIRY FEED

Does Not Get Musty

The dairyman who buys a single carlot to carry him through the season should be protected. His feed should be of the same quality in April as in October. The general experience is that it gets musty and is not so palatable in the spring as in the fall. Quaker Dairy Feed is kiln dried and is guaranteed to keep the season through. This in itself is a commanding reason for buying our feed.

QUAKER DAIRY FEED

Quaker Dairy Feed is made entirely of grain—principally of oats—combined in scientific proportions. It is complete for the production of milk and the proper maintenance of the animal.

SOLD ONLY IN SEALED AND BRANDED SACKS

Specimen Balanced Ration

Mixed Hay	15 pounds
Gluten Feed	6 pounds
Quaker Dairy Feed	6 pounds

Calculated for a cow of 1,000 pounds live weight.

Modern Dairy Feeding—An invaluable book, containing scientifically proportioned rations, including every form of roughage and every variety of feed. Sent postpaid on request. Scientific advice on feeding—FREE. Address

THATCHER MANUFACTURING CO, - Potsdam, N. Y.

The Virtues of Buttermilk.

The growing practice of utilizing the waste products of all manufactures has brought out the fact that buttermilk possesses many unsuspected qualities. A medical paper says its reputation as an agent of superior digestibility has become firmly established. It is, indeed, a true milk peptone; that is, milk already partially digested, the coagulation of the coagulated portion being loose and flaky, and not of that firm, indigestible nature, which is the result of the action of the gastric juice upon sweet cow's milk. It is of great value in the treatment of typhoid fever, and, being a decided laxative, it may be turned to advantage in the treatment of habitual constipation. It is no less valuable in kidney troubles, from its diuretic qualities. It is in great request for the treatment of diabetes, either alone or alternately with skim milk, and in cases of gastric ulcer and cancer of the stomach it can often be retained when no other food can. Chemical analysis shows that in its nature it greatly resembles koumiss, with the exception of which it is the most grateful, refreshing and digestible of the products of milk.—*Ex.*

Official Butter Test of Holstein-Freisian Cows from March 23 to May 1, 1898.

These tests are for seven consecutive days and are supervised by officers of agricultural colleges and state experiment stations, or by persons vouched for by such officers. The amounts of butter fat are determined by the Babcock test, and the amounts of butter are calculated on the basis of 80 per cent fat to a pound of butter, the rule established at the World's Columbian Exposition.

Miss Tutts 38932; age 3 years, 1 month, 4 days; amount of butter fat 10.581 pounds; amount of butter, 13 226 pounds.

Nannette 3d's Pledge 3d 41407; age 2 years, 1 month, 8 days; amount of butter fat, 11.747 pounds; amount of butter, 14 684 pounds.

Aaggie 3d's Wayne Pauline 41393; age 1 year, 11 months, 13 days; amount of butter fat, 9.354 pounds; amount of butter, 11 693 pounds.

Aaggie Cornucopia 2d 30597; age 6 years, 2 months, 1 day; amount of butter fat, 15.044 pounds amount of butter, 18 805 pounds.

Sadie Vale Concordia 32259; age 5 years, 5 months, 3 days; amount of butter fat, 16.772 pounds; amount of butter, 18.405 pounds.

Princess of Wayne 7th 28690; age 6 years, 1 month, 27 days; amount of butter fat, 15.600 pounds; amount of butter, 19.500 pounds.

Princess Aaggie Pauline DeKol 35059; age 4 years, 2 months, 25 days; amount of butter fat, 14.461 pounds; amount of butter 18 076 pounds

Maplecroft Maid 35907; age 4 years, 2 months, 20 days; amount of butter fat, 12.015 pounds amount of butter, 15 019 pounds.

Belle of Schillaard 3d's Aaggie 36825; age 3 years 11 months, 19 days; amount of butter fat, 10.648 pounds; amount of butter, 13 310 pounds.

Netherland Aaggie Madge 34960; age 4 years, 1 month, 16 days; amount of butter fat, 10.734 pounds; amount of butter 13.418 pounds.

Patty Waldorf 39031; age 3 years, 3 months, 18 days; amount of butter fat, 10.810 pounds; amount of butter, 13.513 pounds.

America 2d's Pauline DeKol 37096; age 3 years, 5 months, 15 days; amount of butter fat, 15.903 pounds; amount of butter, 19.879 pounds.

Paul DeKol's Mutual Friend 37172; age 3 years, 4 months, 5 days; amount of butter fat, 11.955 pounds; amount of butter, 14.944 pounds.

Shadeland Ruby 5th 29558; age 6 years, 11 month 1 day; amount of butter fat, 12.501 pounds; amount of butter, 15.626 pounds.

Shadeland Angie 21700; age 8 years, 2 months, 22 days; amount of butter fat, 12 347 pounds; amount of butter, 15.434 pounds.

Maplecroft Gem 34904; age 4 years, 6 months, 5 days; amount of butter fat, 15.357 pounds; amount of butter, 19.196 pounds.

Princess Aaggie Cornucopia 38927; age 3 years, 0 months, 2 days; amount of butter fat, 12.362 pounds; amount of butter, 15.453 pounds.

Minnie Hijlaard 39030; age 2 years, 10 months, 0 days; amount of butter fat, 9.133 pounds; amount of butter, 11.416 pounds.

Vevie Night 2nd's Dorinda 39388; age 2 years, 10 months, 9 days; amount of butter fat, 9.478 pounds; amount of butter, 11.847 pounds.

Zady Bergsma 37409; age 3 years, 1 month, 13 days; amount of butter fat, 12.978 pounds; amount of butter, 12.210 pounds.

Mutual Friend 2nd's Pauline 41396; age 3 years, 0 months, 17 days; amount of butter fat, 12.139 pounds; amount of butter, 15.174 pounds.

TESTS TO ASCERTAIN COST OF FOOD PER POUND BUTTER.

These tests are made and supervisedat the same time.

Mutual Friend 3rd 28389; age 6 years, 6 months, 26 days; amount of butter fat, 14.724 pounds; amount of butter, 18.405 pounds; cost of food per schedule of prices, 96 05 cents; cost per pound of butter, 5.2+ cents.

Paula Dorinda 41109; age 2 years, 10 months; amount of butter fat, 11.099 pounds; amount of butter, 13.874 pounds; cost of food per schedule of prices, 1.0985; cost per pound of butter, 7.9+ cents. S. HOXIE.

(Supt. Advanced Registry Holstein-Freisian Association of America), Yorkville, N. Y.

CONCERNING OUR ADVERTISERS.

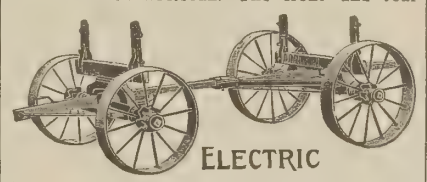
PITTSFORD, Vt., Feb. 8, 1899.

ANIMAL GERMICIDE CO., 319 Washington St., New York—GENTLEMEN:—Wishing to add to your list of testimonials of the value of your Antiabortsio and Specific, I beg to say that for years I have been troubled with abortion and scours in calves. In the spring of 1898, I had 34 fine Holstein calves. At the age of two to three weeks they commenced to scour and die, until I had lost 21, which left me 13, and I considered them as good as dead. Mr. F. Hagadorn was at my place and prevailed on me to try the above named remedy. I had theretofore tried all of the so-called remedies without any avail, and at the time had no faith in this. I finally bought two gallons and am pleased to say it was the best investment I ever made. I commenced to use as directed, and to my surprise, I saved the 13 calves that were nearly dead. At the same time, I had had 7 cows abort. I used the remedy according to directions and up to this time have not had a single case of abortion or scours in calves.

Since Jan. 1, 1899, I have had 8 calves born, and they show no symptoms of disease. And all the cows that aborted last spring are with calf, and my herd, comprising 50 head, never appeared to be as healthy as they are to-day. G. F. HENDEE.

THE MANUFACTURER AND THE FARMER.

Manufacturers of almost every class of goods have always laid heavy stress upon the trade of the farmer. They have sought by all possible means to bring their goods to his notice. They besought him through the columns of the papers he reads, but more largely through the direct personal appeal of traveling salesmen, agents and dealers. In every instance the farmer has had to pay the bill. All the cost of manufacture, the expense of selling the goods, which embraces the salaries of traveling men and their expenses, the commission of dealers, losses on bad accounts, etc., etc., have been charged up on the price of the goods, and you have paid the bill. Of course, you have in many cases been allowed long time on your notes, but even then you have had to pay rates of interest for the privilege.



Why not change all this? Why not deal direct with the manufacturers, and pay the spot cash for what you buy? This arrangement teems with economy, and is by long odds the best and most convenient method of doing business. The Edward Walker Carriage Co, of Goshen, Ind., have adopted this plan of doing business, and find it most satisfactory to themselves and their patrons. They manufacture a full line of buggies, carriages, spring wagons, etc., and sell them direct to the consumer at wholesale prices. They give you at once the advantage of all the added expenses you have been obliged to pay in the past. You get better, fresher goods at a reasonable price. Write them for their illustrated catalogue, prices, etc.

STAY WITH THE FARMER.

In this day of trusts and combines there is some degree of satisfaction in knowing that there are yet a few people who stand ont independently

BUY THE BEST.

If you want the best low down wagon you should buy the Electric Handy Wagon. It is the best because it is made of the best material; the best broad tired Electric Wheels; best seasoned white hickory axles; all other wood parts of the best seasoned whiteoak. The front and rear

hounds are made from the best angle steel, which is neater, stronger and in every way better than wood. Well painted in red and varnished. Extra length of reach and extra long standards supplied without additional cost when requested. This wagon is guaranteed to carry 4000 lbs. anywhere. Write the Electric Wheel Co., Box 130 Quincy, Illinois., for their new catalogue which fully describes this wagon, their famous Electric Wheels and Electric Feed Cookers.

THE NEW BOOK
Feeds and Feeding
By Prof. W. A. HENRY.
Wisconsin Experiment Station.

This book should be in the hands of every stock feeder in the country. Every reader of HOARD'S DAIRYMAN ought to have it. It is a large, well bound book, nicely printed, over six hundred and fifty pages. Price $2.00.

Four Yearly Subscribers at $1.00 Each ($4) Will Secure It as a Premum.

or

Four Yearly Subscribers at $1.00 Each ($4) Will Secure It as a Premium.

Of This Book Hon. JAMES WILSON, Secretary of Agriculture, Washington, writes as follows:

"Prof. W. A. Henry, Dean of the Agricultural Department of the University of Wisconsin, has recently given to the American student and the American farmer a work on feeds and feeding. Singularly enough, up to this time we have had nothing along this line sufficiently comprehenisve from both the scientific and Practical standpoints. We have had very able works from both, but Prof. Henry is the first to combine science with pratice, and give us a work that will be of value alike to the instructor in the Agricultural College, to the student who is seeking the principles underlying feeding, and to the practical farmer who feeds.

This publication will take its place immediately in the college library, and ultimately in the private library of every farmer in the land. When the instructor, student or practical farmer inquires where there is a work thoroughly exhaustive of this subject, he can now be refered to Prof. Henry's book.

Send as above, or will be forwarded, carriage paid, on receipt of price $2.0

$30 Saved

We will save you $30. on a top buggy. This high grade, leather quarter top buggy for $44.10 Never retailed for less than $75. It is made throughout of the very best of material that money will buy. MARVIN SMITH CO. 55-57-59 N. Jefferson St. B-18 Chicago, Ill.

and prefer to take chances with the man who tills the soil.

Among these may be named the Advance Fence Co., of Peoria, Ill., whose advertisement appears regularly in these colums. They manufacture woven wire fence of the various standard heights and sell it direct from their factory to the farmer. In fact they positively refuse to conduct their business in any other way, and the individual consumer can buy Advance fence just as cheaply as the dealer. The fence is of excellent quality and the methods of dealing are fair and equitable. If you are seeking farm fence of good quality, in any quantity, you should open correspondence with these people. Write them for illustrated catalogue which they mail free. Tell them that you saw the ad. in our paper, please.

THE following testimonial speaks well for the Ingersoll mixed paints advertised in the DAIRYMAN. Samples are free. See ad.

CHICAGO CO., Minn., Dec. 10, 1898.

MR. C. W. INGERSOLL,—DEAR SIR:—Having used your paint on our Grange Hall, I can say on behalf of the 81 members of the Oak Leaf Grange No. 569, we are thoroughly satisfied with the results, and give it the highest recommendation of any paints used. Fraternally yours,

AND. MOLBERG, Sec'y.

VETERINARY.

Queries in this department answered by WM. HORNE, M. D. V. S., Janesville, Wis.

COW PHYSIC—Three-fourths to 1¼ pounds Epsom Salts (according to age and size of animals) and two ounces of best ground ginger. Pour over this three pints of boiling water. When at 105° F., give gradually as one dose.

FAILURE TO COME IN HEAT.

I have a registered Jersey cow 3 years old that dropped her calf 23rd of last September and has not been in heat since. She is in good condition and plays about when turned out. Can something be given her to induce her to come in heat? E. S. M.

Dryden, Minn.

ANSWER.

Your easiest, cheapest, and in all respects, best remedy is one of the special medicines for not coming in heat, advertised in the DAIRYMAN, which see. These are studiously compounded especially for failing to come in heat.

GARGET.

I have a cow, 8 years old, was fresh the 8th of last February. She gave five gallons of milk per day; got along all right until about two weeks ago, there came a sore on end of front teat, extending about ½ inch up the teat. I had to pick the scab off to get the milk. I used a milk tube a few times and that quarter got to swelling, and finally caked up, and there is a greenish water comes from it; has a very bad smell. I gave her physic several times, and her bowels are all right, but she is getting very thin; has a poor appetite. She seems to be stiff in her legs, lays down most of the time.

Wilmington, O. J. F. McM.

ANSWER.

Bathe the teat and quarter with water as hot as she can stand, several times a day, until improved. Inject the following solution: Tilden's Bromo Chloralum, one to eight of warm water, two teaspoonfuls at a time; then get this out and inject again for 3 or 4 times a day, for a while, or until not needed. Rub tolerably hard with strong camphorated spirits, six parts, and common turpentine, one—only—part. Internally give two drams of blue flag in two or three ounces of old whiskey and four of water, for several days. Use much daily massage, kneading and gently squeezing, rubbing, etc. Sunlight, pure air, water and exercise every day.

INJURY TO TEAT.

I have a valuable registered Jersey cow which was injured by another animal stepping upon and cutting off one-half inch from end of teat, with result that milk runs out of this quarter almost constantly when cow is flush. Is there a remedy, and if so, kindly give it in your valuable department, as there may be others who have had cows similarly injured. W. L. H.

Lincoln, Neb.

ANSWER.

There is only one way to do. Dress the end of the teat, always gently, with oil of almonds, half an ounce, and the same of spermaceti, and as much compound tincture of myrrh and aloes as you can conveniently mix with this. Never pull off the scab—never work. I think I would use a hard rubber tube and a plug. They can be inserted and fixed in so as to remain until taken out to reflow the milk, etc. Be very particular to flow hottish water through the tube each time before inserting, as there will be quite a lot of extra stuff to block up the channel of the teat, etc. Always—every body—hold the teat straight down when inserting the tube, or plug. I have seen and admonished many persons for taking hold of the teat and turning the end upwards and then pushing in the tube while the teat was—as a matter of course—bent. This act has sored hundreds of cows' teats and the foolish actors have invarably laid it to the use of the tube. With an ordinary cow, I could use a tube for twenty years and not sore the teat. So can anybody else, if they will try.

NYMPHOMANIA.

On page 1065, Feb. 10, is an answer to A. W., Tempe, A. T., for chronic nymphomania, you do not say at what time before coming in heat that the medicine should be given. Should it be given so that the last dose will be given a day or two before, or does it make any difference how soon after having medicine should the cow be served. I have got a grade Jersey that acts the same as A. W.'s heifer and she is too good a cow to lose. R. T. R.

Belmont, Mass.

ANSWER.

Once again, service is adding fuel to fire, always. About ten. Your best plan is, always, to get a reliable special medicine with full professional printed directions. See ads in the DAIRYMAN.

WANT OF SALT.

My horses seem to enjoy biting each other, on neck and shoulders, and sometimes they seem pretty rough about it. One has a swelling on top of withers, very similar to poll evil, that I am satisfied is from the biting or bruising. I believe it has been growing for at least a month.

Randolph, Utah. W. S. M.

ANSWER.

The desire for salt is quite often the cause for this morbid desire, also licking dirt, etc. You ought to have put a stop to the biting upon its first appearance. Give them constant salt before them. Wash the neck clean and put on some offensive material disgusting to the horses; this will do all needed.

LUMPY MILK.

I have a Jersey cow which, after having been dry about six weeks, dropped her fourth calf the 22nd inst.—six days ago. She never makes much bag before calving. In this instance she was springing only about a week. She did not have much milk. After the calf sucked I milked her carefully and clean, but I observed that some hard lumps came from the left hind teat. I left the calf with her all the time, but milked the cow each night and morning. Last night and this morning I have been unable to get more than two or three tablespoonfuls of milk from that teat. J. K. H.

Livonia, Ind.

ANSWER.

I know of nothing to do, but feed nutritious sloppy food, and use massage, and by milking by hand. You did wrong to allow the calf to suck. Suckling calves have ruined many good cows. They are artificial animals, as it were, and we can't do any thing but harm, when we try to mix nature with the artificial process.

APOPLEXY.

I have lost three calves and three sheep by apoplexy. The calves have had separator milk with a little oil meal (Cleveland, steam cooked) and it is a year old, with three times as much bran with it; with all the hay and straw they will eat. The calves have been from 6 to 8 weeks old. The calf that died to-day I examined and found his brain very clotted, and his gall was very full; I thought twice as large as should be; I examined as soon as dead. The sheep had silage and hay and some salt, but not salt before them all the time; after putting salt before them lost no more sheep. The calves have a dry warm place in box stalls so they can exercise themselves. J. H. B.

Harrisonburg, Vt.

ANSWER.

You give me poor information as to symptoms, etc. I really don't know the cause in your case. There are many and quite different causes. Extravasation of blood in the lung, or lungs, is quite often the cause,—malignant anthrax, purpura hemorrhoge, etc. Such conditions demand and must have a personal examination to secure the correct and true nature of the cause of death, etc. Correspondence beyond this is not permissible.

DIARRHŒA IN CALVES.

Have had three calves die and have two more that I think will die. The first was about two months old, the others eight days old. They have diarrhœa, refuse to eat, get weak, breathe hard, nose gets cold and runs white stuff, seem to be cold, and in two or three days die. They are all right when they come, and the last two I have left with their mothers. E. D.

Tunnel City, Wis.

ANSWER.

There are several causes for diarrhœa in calves. Castor oil, one ounce, laudanum two drams—not more—one dose a day for two to four days. With this give porridge of linseed meal, or slippery elm. Also starch gruel, half a pint at a time. One scruple of nux vomica in each dose of any of the above. Change the food. Rub the belly briskly several times a day. Put a bit of clean and unslacked lime in the milk, the size of a hickory nut. Should they become costive, give warm castile soap injections once a day until not needed. Sun light, pure air and quiet.

Only one at a time of either of the above.

GARGET.

Can a cow, that has had garget, be cured of the disease permanently, or will it appear at the next calving? A. D. M.

Portland, Me.

ANSWER.

I can't tell. I incline to the belief that you will have to use all diligence and care to do this. You have a chronic gargetty cow, and they are always bad to manage. Your treatment is all I can give you.

ALFALFA BLOAT.

Will you kindly say where I can procure a trochar, or the instrument used for tapping a cow for bloat?

I am operating a creamery here, recently started, and during the last few months, several of our patrons have lost cows feeding on alfalfa hay, and which were lost from the neglect to have at hand the proper instrument to relieve the animal attacked, quickly. I have never had any experience with alfalfa, but I tell the people who inform me of their loss that no doubt with proper attention to the state of the bowels, and general conditions of their animals, this could be avoided.

Big Horn, Wyoming. T. S. S.

ANSWER.

Lucern should always be fed sparingly, never to a full feed, but judiciously mixed with some less heavy, nutritious stuff. A six-inch section of good garden hose is a simple but effective trochar in case of hoven or bloat. It is usually all that is needed. It is to be withdrawn and washed out two or three times, as it fouls with stuff from the paunch. A little quick lime in the water is a good preventive of hoven.

Sure Rupture Cure.

Wonderful Restoration Reported from Boston, Mass.

GEO. F. MULFORD CURED AFTER SUFFERING EIGHTEEN YEARS.

Despi te the claims so frequently made that a surgical operation is necessary to cure rupture, the case of Geo. F. Mulford of Boston, Mass., who resides at 484 East 5th Street is pointed out as a direct refutation of the surgery belief. Mr. Mulford was ruptured for eighteen years and tried everything known almost but failed to even derive benefit. His rupture was such that trusses did not hold him and for this reason, the surgery idea was presented to him as the last resort. A final effort was made by the comparatively new method invented by Dr. W. S. Rice of Adams, N. Y., well known as a rupture cure specialist and in two weeks after treatment began Mr. Mulford was practically a cured man without having suffered pain, operation, detention from work or suffering of any kind.

GEO. F. MULFORD.

The important feature of the Rice invention is the fact that it holds any kind of a rupture no matter how severe it may be and is worn with so much ease and comfort night and day that a person scarcely realizes he is wearing it. The case of Mr. Mulford is somewhat identical with that of Geo. Bell, of St. Charles, Minn., reported cured by the same method of treatment. It is a wonderfully brilliant invention, is sold at a marvelously low price and is the greatest blessing ever devised for those who have suffered with rupture and erroneously believed there is no cure outside of the knife.

Readers should send for Dr. Rice's illustrated book on the cure of rupture and mail it to anyone they know to be ruptured. Such an act of kindness will be worth a great deal to those who suffer with this great affliction. Write to Dr. W. S. Rice, 353 Main St. Adams, N. Y.

FITS Permantly Cured. No fits or nervousness after first day's use of Dr. Kline's Great Nerve Restorer. Send for **FREE $2** trial bottle and treatise Dr. R. H. KLINE, Ltd., 931 Arch St., Philadelphia, Pa.

Producing Clean Milk.

ED. HOARD'S DAIRYMAN:—Have just been reading about the man who milks into 1½ inch holes, in the top of his pail cover. It seems to me it would require a good deal of time and patience to learn to hit them right every time.

Have had fifty-six years of practical experience in milking, and have very seldom missed being on hand when milking time came. My way has always been to brush the cow thoroughly until I am pretty sure there is nothing to fall in the pail, then wade in, for all there is in it. Am sure my elbows go and come enough so that the streams of milk would seldom get inside the pail, so I have thought of suggesting this as a substitute. When first I began to take the DAIRYMAN, there used to be the picture of a cow, to which some one had strapped a cloth in such a way as to cover the udder to keep her neighbors or herself from sucking. Now why could not this same man make his fortune by inventing some way to have holes in the cloth; let the teats protrude; then we could milk without having to close one eye to take aim at those little holes. Am not sure but I would like to make such a purchase myself, when he gets them so they work nicely. H. E. HERRICK.

Ashland Co., Ohio.

Further from Jamaica.

ED. HOARD'S DAIRYMAN:—I have read with interest the ration you proposed for my friend at Port Maria, under the head of a "Jamaica Ration" in your issue of February 3rd, 1899, page 1,034.

Wheat bran, cotton seed meal, linseed oil cake, oats, etc., have all to be imported. I consider cost too high on account of heavy freight, duty, etc., to be profitably fed to milch cows.

I do a milk business, only, and have at present merely "scrub cows" of a Devon mixed with Short-horn strain, giving about 12 quarts daily. Later on, however, I intend importing Holsteins, and going in for that breed exclusively.

I pasture my cows on Guinea grass and Para grass (this latter I take is the same as your "water grass", analysis of which I enclose). I bring the cows into the stable at about 1 to 2 p. m., and I want you kindly to make me out a balanced ration for feed in the stables, when the stock come in.

I can grow sugar cane and green fodder corn at a comparatively small cost, also bananas, (analysis of the green and ripe banana I enclose). I can also purchase rice bran at 75 cents per 170 pounds. I send you enclosed a sample of this rice bran, and should be much obliged if you would kindly send me the analysis of it. How will it take the place of your wheat bran, and how will it do as a feed for young calves?

As I can sell all my milk at 9 cents per quart, I do not want to give my calves a drop more milk than is absolutely necessary. How soon can I begin feeding them the rice bran and in what quantity?

What feed will it make for horses, mixed with corn or oats?

I am a great believer in your paper, and find it very useful, and as a proof I enclose $2.60, for one year's subscription for my brother. H. FARQUHARSON KERR.

Jamaica, W. I.

Rice bran has the following analysis:

	Total Contents.	*Digestible Nutrients.*
Water.....	9.7	
Ash.....	10.0	
Protein.....	12.1	5.3
Carbohydrates.	59.4	45.1
Ether extract..	8.8	7.3

As wheat bran has 12.6 per cent digestible protein, it is quite apparent that rice bran would be a poor substitute for it, unless there is a great error in calculating the digestibility of its protein contents, which we confess seems probable. The only way to determine this satisfactorily would be to try it experimentally. We should apprehend no bad results from feeding it very freely, by which we mean, all a cow will eat, but bringing her to this limit gradually. If a cow should eat in pasture and dry hay the equivalent of 20 pounds of this Para grass, and 12 pounds of rice bran in addition, there would still remain a very decided deficiency in protein, which it seems to us could not be supplied in any way more cheaply than to import cotton seed meal.

We must say, however, that we consider 12 (imperial) quarts of milk per day, (equal to 30 pounds,) a very good yield indeed, especially if it can be maintained for several months at approximately this rate.

We should not like to feed this bran to calves until after they have commenced to ruminate, as it evidently is not readily digestible, judging as well from the appearance of the sample sent us as from the tables of digestible nutrients. Hay tea makes a very fine substitute for milk in calf rearing, and is made by steeping or boiling hay in water, and thus extracting its nutritive constituents. Early cut hay is best, and it is quite probable that some of the rice bran could be mixed with the hay to good advantage. One cannot be expected to give explicit directions as to the amount to be used, but the feeder, watching from day to day, should be able to determine this. It is usual to recommend ground flax seed to be used in connection with hay tea, but rice bran is quite rich in fat and might suffice. Whole oats are also fed to calves with excellent results.

We do not feel competent to express an opinion as to the use of rice bran for horses. It does not seem to us a very desirable feed for this purpose, both on account of its bulk and low per cent of protein, and yet experience may demonstrate the contrary.

FREE TO MILLIONS OF SUFFERERS.

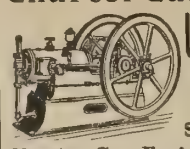
The New Cure For Kidney, Bladder and Uric Acid Troubles.

Almost everybody who reads the newspapers is sure to know of Swamp-Root.

It is the great medical triumph of the nineteenth century; discovered after years of untiring scientific research by the eminent kidney and bladder specialist, Dr. Kilmer, and has truly wonderful powers in curing kidney, liver, bladder and uric acid diseases.

Kidney trouble is responsible for more sickness and sudden deaths than any other disease, and is so deceptive that thousands have it without knowing it.

Your kidneys filter your blood and keep it pure, that's what they are there for. You are well when your kidneys are well.



Thousands owe their health and even life to Swamp-Root, and thousands more can be made well, who to-day think themselves beyond help, if they will take Dr. Kilmer's Swamp Root.

By special arrangement with the DAIRYMAN and to prove for yourself the wonderful and prompt curative powers of this great discovery, every reader will be sent by mail, prepaid, a free sample bottle, and with it a book telling more about Swamp-Root and containing some of the thousands upon thousands of testimonial letters received from sufferers cured.

Please mention that you read this generous offer in HOARD'S DAIRYMAN and send your address to Dr. Kilmer & Co., Binghamton, N. Y.

If you are already convinced that Swamp-Root is what you need, you can get the regular fifty-cent and one-dollar sizes at the drug stores or of medicine dealers. Make a note of the name, SWAMP-ROOT, Dr. Kilmer's Swamp-Root, and remember it is prepared only by Dr. Kilmer & Co., Binghamton, N. Y.

We are the only firm that builds factories complete, put them in operation and guarantee results.

ILLUSTRATION.

The combined seed drill and wheel hoe, illustrated below, shows only one of many of the wonderful "Iron Age" labor saving implements. This tool is a whole tool house of itself. It is a perfect seed drill, double wheel hoe and single wheel hoe. It will sow, weed, cultivate, rake and plow—in fact, it will do all the work that could be desired in a garden or truck patch. The wheels are made of steel, 16 inches high; the frame is made of pipe coupled to malleable castings. The arch is high, so that 20-inch plants can be cultivated without injury. The combination is such that it can be quickly changed to a perfect double or single wheel hoe, as may be desired; while the seed drill, which is a perfect one, can be quickly attached or removed. This tool, in common with the other well known "Iron Age" implements, is having a large sale throughout the country.

The "Iron Age" Combined Seed Drill and Wheel Hoe.

The handsome "Iron Age" catalogue sent free to all mentioning this paper. Address Bateman Mfg. Co., Box 153, Grenloch, N. J.

HOW THEY GROW ONIONS IN RHODE ISLAND.

One of the most striking pictures in our new 1899 Catalogue is a long procession of men sowing onion seed with the "PLANET JR." Hill-dropping Seeder, one of the greatest labor-savers in the whole list. It shows how live Yankee onion growers are making money with the "PLANET JR." tools.

This catalogue will interest your whole family. It not only describes the Seeders, Wheel-hoes, and combined hand tools, the Horse-hoes, the Pivot-wheel Cultivators, the wonderful Beet Cultivator that works four rows at once, and all the other horse tools, but it includes also SIXTEEN FULL PAGES of fine photographic views—interesting field-scenes in France, California, New Zealand, Manitoba, etc., showing the different crops and methods of cultivation, and the "PLANET JR." tools at work. Write for a copy; it's free.

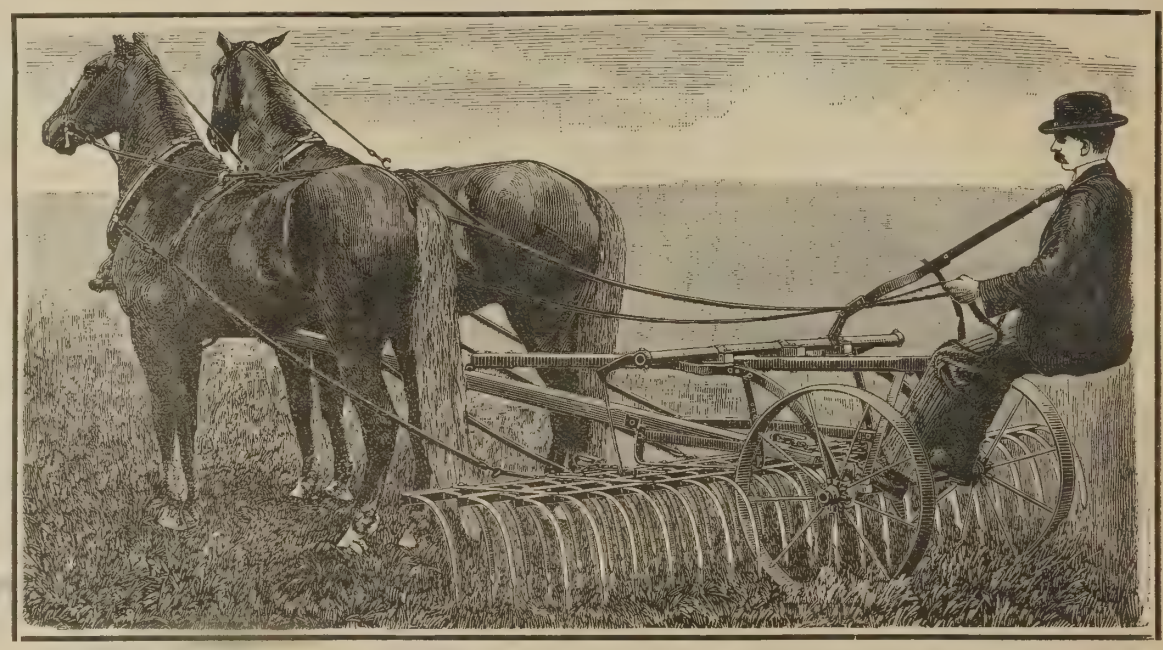
Hallock's Success Anti-Clog Weeder And Cultivator

The most practical and profitable machine ever invented for both weeding and cultivating all kinds of crops. Almost doubles the yield; does more and better work and saves more money than any other implement ever made for the purpose. Write at once for full information and sheets of testimonials from progressive and prosperous farmers in every state. (*$100 reward for any testimonial proven to be false.*) Read what those who have used it say about it.

"Hallock's Success Anti-Clog Weeder does all that your circulars claim for it. I have used it on everything, **onions, melons, beans, potatoes, corn, wheat.** It is a great labor-saving machine. I certainly want the sale of your weeder another season." HENRY HOGUE, Pepin, Wis.

"I tended last season 75 acres of **corn** and **potatoes** with the Success Anti-Clog Weeder, and I am in my 70th year. I must say I never before saw such clean fields of corn and potatoes in my life. With the weeder I did with one team as much work as three men and three teams could do with the old style cultivators, and did the work in a very much better manner, too." L. B. MARSH, Trempealeau, Wis.



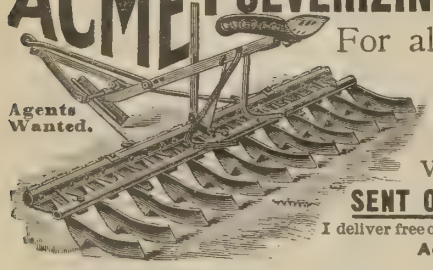
"I used your weeder on twenty-five acres of **corn** and ten acres of **potatoes** during the past season. It was run exclusively by a thirteen-year-old boy. I find, as the result of using the weeder, that, if run in time, the weeds cannot start. Its work is highly satisfactory." W. J. ROBERTS, Columbus, Wis.

"I would not be without the Success Anti-Clog Weeder for three times what it cost me. I would like to have the agency for my county. I have used the weeder on **corn** before it was up, and after it was plowed, with great success. Just after the **corn** was planted we had some heavy rains, which packed the ground very hard. I put some weight on the weeder and it did the work very fine." MARLOW KIDD, Glen Haven, Wis.

"I like the Success Anti-Clog Weeder very much. I worked 30 acres of **corn** and 1 acre of **potatoes,** and the consequence was I had good, clean corn and potatoes, and I would not sell my weeder, if I could not get anyother one, for $25. I have seen a good many weeders, but I like yours the best of any. I think it is the best weeder made." C. E. GIBBS, Prairie du Sac, Wis.

"The Success Anti-Clog Weeder is all you recommend it to be. Five times the price would not buy mine from me if I could not get another." E. KINNEY, West Salem, Wis.

"I used the Success Anti-Clog Weeder on my **wheat** after sowing clover seed and it was worth twice its price every day I used it for that purpose. For cultivating corn and potatoes it is the best tool I ever had on my farm. My ten-year-old boy worked my corn with the weeder when corn was 2½ feet high without removing any teeth. I used the weeder in a truck garden on **corn, potatoes, beans, cabbage, tomatoes, onions, beets** and **strawberries,** and it did very fine work. It is the greatest labor-saving, money-making tool on the farm." T. J. HALFERTY, Brimfield, Ind.



Special Price on the first order from every district where we have no agency. And the agency goes with the first order if you want it.

CAUTION: This Weeder is protected by our patent No. 600,782, dated March 15, 1898. The public is notified and warned that any infringement on our flat tooth Weeder, whether manufacturing or dealing in the same will be promptly prosecuted. Agents handling our Weeders are requested to send us names of persons thus infringing on our patents.

Sharples Tubular Separator.

Send to us for a circular of this separator and ask any questions you wish to know about it. Let us know your needs in the separator line and do us a kindness by giving us names of any others needing separators. We put the TUBULARS in on a very strong guarantee as to what you may expect of them and what they must do in actual use. They please other very exacting and experienced users and they will please you.

DIXON, NEB., February 21, 1899.

DEAR SIR:—

The **No. 40 Tubular Separator** gives us the very best of satisfaction. When skimming 4,170 lbs. of milk per hour, I test the skim milk repeatedly and never find over .05 of one per cent fat, and often less.

The quality of the cream is of the highest class,—a rich, smooth cream. We are well satisfied with the machine in every respect. Yours,

J. N. JACOBY, Sec. Dixon Creamery Co.

The U. S. Excels in Every Particular

FORESTVILLE, CONN., Feb. 18th, 1899.

The Improved U. S. Separator is giving excellent satisfaction. In comparing it with other makes, have found it to far excel in every particular—in thoroughness of skimming, ease of operation, design and finish, simplicity of construction, therefore easy to clean, and durability. Any one contemplating buying a Separator should investigate the merits of the Improved U. S.

WILLIAM F. KENNEY,
Buttermaker for J. Hart Welch.

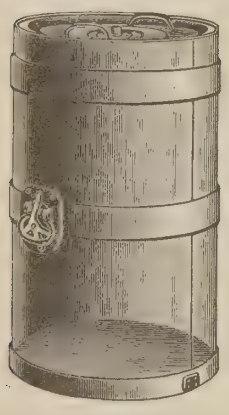
The U. S. the Best on the Market

DEER PARK, MO., Feb. 25th, 1899.

The butter I exhibited at the St. Louis Fair scored 98½ points and won the Sweepstakes over the creamery butter from several of the best Creameries in the United States. It was made from cream separated by the No. 5 Improved U. S. Separator I have been using for nearly three years, which has always been in running order and given entire satisfaction. If I had to buy another it would be an Improved U. S., for I think it the best on the market.

NATHAN KING.

No Loss of Cream in the Skim Milk



BROMPTON FALLS, P. Q., Jan. 31st, 1899.

The No. 1 and No. 0 Improved U. S. Separators purchased last spring are giving perfect satisfaction. They run smoothly and easily and take all the cream out of the milk. They are simple, durable, and not liable to get out of order.

AS IT IS IN WISCONSIN.

The net gain in Wisconsin, in the manufacture of butter between the years of 1885 and 1895 was $6,459,971. The gain in the value of the cheese manufactured in the same decade was $999,280.

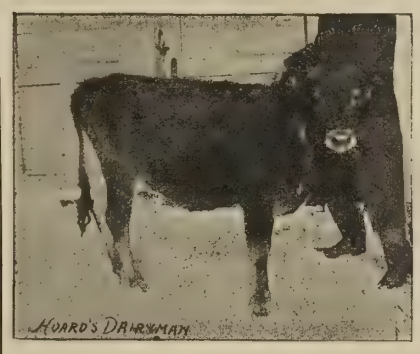
In no state in the Union have the farmers been talked to as much on the true principles of dairy farming as in Wisconsin. Our dairy conventions, farm institutes, the Dairy School and Short Course in Agriculture, at Madison, and the many who read Hoard's Dairyman as well as other papers, all constitute a great educational force. Does it pay? Read the above figures and ask the men who are getting rich by the aid of their cows. Brains, thought and study pay nowhere better than in dairying.

AS IT LOOKS TO HIM.

Daniel Brinkley, of Ravenna, Ohio, writes:

"Notice of expiration of my subscription forwarded to me here. Agreeable therewith I herewith hand you the *best invested* dollar I ever parted with. Although practically out of the dairy business, I cannot afford to be without Hoard's Dairyman in my family of growing boys and girls. It should be in every home in the land. The topics it treats upon are what the growing generation must come in contact with, and by keeping posted on present and past methods, they are better prepared to solve future problems."

It is very seldom that we have seen more truth concerning the future of the coming farm boy and man, crowded into fewer words, or better stated, than the above. What Mr. Brinkley says needs no comment. It speaks for itself in the minds of all thinking, intelligent farmers.



THE DAWN OF A BETTER LIGHT.

It always does the heart of the Dairyman good to get a letter from a subscriber who has profited by its teachings and wants his neighbors to share in the benefit with him. Mr. Amos C. Hallman, of Baden, Canada, sends us the subscriptions of two of his neighbors and writes as follows:

"I tell my neighbors that the Dairyman is worth many times its cost in what it teaches a man in selecting and judging a cow. I have paid particular attention to the different cuts of fine cows and the dairy form and type which have appeared in Hoard's Dairyman. Twelve years ago when I bought my first cow, I knew nothing of how to judge a cow. All I saw was a good sized udder. Now I like a good sized udder as well as ever, but I don't think you can judge a cow alone by that. The following points, I think, tend to show if the cow is of the dairy form and character: Sharp withers and incurving thighs are important. The high pelvic arch I had never seen mentioned until I saw it in the Dairyman. Another point, lots of room to store the food in. Now, when I look my herd over, I find that the cows that have these points prominently are the best.

So much for reading the Dairyman."

The Dairyman has often received requests to publish pictures of young animals of the dairy type, with a view of showing the latent dairy conformation. In some respects such cuts are valuable as showing at how early an age the typical conformation of a dairy animal can be observed. Calves at an early age should show the beginning of the dairy form, and even though it is there in embryo, it is sufficient to give promise of the future, under skillful care and feeding. Together with the cuts which appear in this issue, Mr. Beach, of the Storrs College, has sent us three photographs of calves, from which the accompanying cuts were made. Except in one case, no data was sent with the pictures.

The first in the series is a daughter of cow No. 2, Class I. The mother is designated by Mr. Beach as of the "ideal dairy type." She shows a net profit of $42.82 for the year. An examination of the cut of No. 2 will indicate to what extent she conforms to the "dairy type" as advocated by the Dairyman. Comparing the mother and daughter, we find that in those points in which the mother is prominent, the younger animal promises well. They are yet in embryo, but none the less there. Such calves are not pleasing to the beef man. They are not smooth enough in outline. They are too paunchy for their size; too thin in thigh and flank to promise well for future beef. A general want of evenness of outline would cause a beef man to give them but a single glance and then turn away for something more "square ended." To the dairyman, looking on with different purpose and different eye, they are full of promise.

THE MILK TRUSTS.

Where will this formation of trusts end? The latest is a milk combination with a capital of $30,000,000. It will be known as the New England Dairy Co., and will absorb all the milk selling concerns in Massachusetts, Vermont, Connecticut, Rhode Island and New York. It would appear to a casual observer that the farmers who supply the milk, if ever the trust becomes oppressive, could institute a whip-row very easily, provided they would organize. But there is the rub. The capitalists can organize, even with millions at stake, but the farmers will not. All that would be necessary to do would be for the farmers at every milk shipping station to organize a creamery and equip it and manufacture all their surplus milk into butter and feed the skim milk to calves and pigs. The milk trust bank on the fact that farmers will not organize and are not smart enough to keep their surplus milk at home and divert it to some other use, but that they must helplessly sell it to them, the trust. We must say the trust is generally right in its estimate.

But all this whip-row business depends on the milk shipping farmers having good dairy sense, a judgment and understanding as to the value of skim milk and how to feed it to young pigs and calves. Not one in a hundred of these milk shippers are well posted dairymen, capable of handling the whole question in all its economy or to all its profit. They are not skillful breeders of dairy cattle. They are liberal feeders of certain feeds, but few of them, however, believe in a balanced ration. They have gone to keeping cows and shipping milk with but little real dairy knowledge and the trust will handle them easily.

There is not a combination in the world that is as weak as one of these milk trusts, if only the farmers, on whom the trust must depend, understand the ins and outs of the whole dairy question, and would organize and work together intelligently for their own protection.

The trust never pays as much for the whole milk as a skillful dairyman and feeder of skim milk can get out of it, when profit and fertility of the farm are considered together. But most of these men, whom the trust gets its grip on, do not consider fertility of any special moment. What they are after is the present dollar. The future of themselves and the soil must take care of itself. Such sentiment and such men form a gateless opportunity for trusts of all kinds.

Brains Better than Muscle.

Ed. Hoard's Dairyman:—One of the best and most successful farmers in the state of Michigan with whom I became acquainted during my recent term of work there in the Farmers' Institutes, is A. M. Welch, of Ionia. He has a farm of 400 acres of good land. Not a great many years ago he was in debt $14,000 on it. He was strong, active, energetic and ambitious. His neighbors say "he was a terrible worker." But with all his expenditure of muscular energy, he was unable to reduce his indebtedness. Interest, taxes and other expenses absorbed all his profits.

One day in running a machine, one arm was so mangled that amputation was necessary.

At first he was terribly discouraged and thought his chances of ever paying for the farm were forever gone. But before the stump of his arm was healed over, he had made a firm resolve that now that he was forever unable to do manual labor, his brain must do the work. He determined to fertilize his brain and, as he was then to a limited extent engaged in the dairy business, Hoard's Dairyman played a very important part in this work. He increased his dairy, got better cows, learned how fine butter was made and how to get a good price for it. He commenced to supply the city with milk, and people soon learned that the best and purest milk to be had came from

Welch's farm. He had things all his own way in the milk business.

To make a long story short, Mr. Welch is now out of debt, has a fine house, large and convenient barns, with an abundant water supply handy in all of his buildings. In short, his place is a delight to all who visit it. Twelve years ago he built the first silo in that part of Michigan, and now others having patterned after him, there are thirty silos in his neighborhood.

People say to him: "Welch, what a pity it is that you did not lose your arm before." And he freely admits that "one brain is worth more than a half dozen pairs of hands."

I cannot help adding what has been said in substance many times before, that if farmers would try to know more, they might work less and get vastly better results. If they would take time to fertilize their brains their fields would be more fertile and produce better crops and more money.

Jefferson Co., Wis. C. P. Goodrich.

Dairy Outlook in Northern Wisconsin.

Ed. Hoard's Dairyman:—Burnett county, Wisconsin is in our new north—that part of the state which is steadily and quite rapidly developing into a splendid dairy region. To show you how things are moving, the following is worthy of note:

In a recent visit to our Agricultural College, by Mr. Ed. L. Peet, editor of the *Burnett County Journal*, published at Grantsburg, we were informed that there are now three creameries in Burnett county. These three creameries last season shipped their butter direct from Grantsburg to New York City, by a through refrigerator car. There came back to Grantsburg from New York City $30,000 in payment for the butter so shipped. This shows how the railroad and the refrigerator car have brought what some people think is the back part of Wisconsi almost to Manhattan Island, for it only costs about a cent and a half a pound to move butter that whole distance, and because of the refrigeration, it is practically as good when it reaches New York, as when it left Grantsburg.

Thus the pioneer farmers of Grantsburg, owning a few cows, have a cash monthly income. Three more creameries are now be-

ing built in Burnett county, and two creameries just across the line in Polk county.

This region is filling up with creameries, and is becoming one of the best dairy districts in Wisconsin. The people are frugal, hard working pioneers, who are starting out with good creameries, and a majority of them take the best of care of their cows. In this particular they are ahead of some other sections in the state that I visited, where, while more cows are kept, the farmers are more careless as to their care and management.

W. A. Henry.

Wisconsin Agricultural Experiment Station.

Mr. Wheaton's Canadian Dairy Notes.

Dairying in Quebec.—A Bonus for Improvements in Cheese Factories.—Disposing of Next Season's Product.—Winter Dairying.—Butter Export.

Ed. Hoard's Dairyman:—No part of Canada has made greater progress along dairy lines during recent years, than the Province of Quebec. The dairymen there seem more eager to adapt themselves to the needs of the times than those in some of the older dairy districts. The reason for this may be that the dairyman who has followed the business for 25 or 30 years is more "sot" in his ways, and it is more difficult to get him out of the old groove, than the one who has not traveled so long in the way. It is reasonable to suppose that experience would bring more perfect workmanship; and so it does in a great many cases, but not always. How often we see a beginner in the dairy business, who starts out on proper lines, reach a stage of perfection, if such were possible, in a very few years, far in advance of his neighbor, who has, perhaps, been a dairyman for a quarter of a century. If this holds good with individuals, why will it not do so with districts?

For several years the dairymen of Quebec have been carrying on a system of instruction in the cheese factories and creameries that in many respects far excels anything of

the kind practiced in some of the older dairy sections. The quality of the instruction given may not be any better, and in fact may not be so good, but its comprehensiveness is specially commendable. Instead of an instructor visiting a factory here and there, that may apply for his services, as is the case in Ontario, the instructor in Quebec is placed over a group of factories covering a comparatively small area, which he can easily make one trip over once a month. By this plan all the factories are visited in the district, regularly, which makes the instruction imparted more uniform and insuring an evener quality of cheese. Each of these districts looked after by an instructor is known as a syndicate, and there are upwards of forty of them in Quebec. Each syndicate contains from 15 to 25 factories or a sufficient number to keep an instructor busy during the season, and still allow him enough time to attend to his duties properly. One or two inspector-generals are employed to look after the local instructors, so that there is a complete and uniform system over a large area, which must result in bringing the quality of all the cheese or butter made in this area up to a uniform level.

The Quebec government has recently made another move that must go a long way towards improving the quality of the cheese in that Province. One of the crying needs of the Canadian cheese industry to-day is better curing rooms, and better methods of controlling the temperature during the curing process. The sub-earth duct is highly recommended for this purpose, and the Quebec government has decided to give a bonus of $50 to every cheese factory in the province that will put in a sub-earth duct, and other facilities for properly controlling the temperature in the curing rooms. A sub-earth duct in the average curing-room will cost from $125 to $200, so that the amount of the bonus will go a good way towards paying for the actual cost. Whether one believes in a bonus of this kind or not he cannot help but admire the good sense of the Quebec authorities in seeing the need of the industry and in doing their part to supply it.

Dairymen, in Ontario, are, however, very much alive in these matters also, and from what we can learn there will be a regular revolution in a great many factories in regard to curing facilities, notwithstanding that no bonus will be given by the government of this province. But why should dairymen wait for a bonus in order to enable them to put their business in order? A sub-earth duct and ice-rack in the curing rooms will more than pay for themselves in one season in the improved quality of the product and less shrinkage in the weight of cheese while curing. These improvements are then good investments for our dairymen, and unless the factory buildings are not worth it, there should be no hesitancy, whatever, in putting in the necessary appliances for properly curing the cheese after it is made. When one looks at this matter in a reasonable way, how foolish it seems not to do these things. To make a good cheese, and then have it spoil in the curing process seems to be the height of absurdity.

In a couple of months the cheese factories will be opening up again for business. The outlooks for prices just now is much more favorable than it was a year ago at this time. Though the cheese market has been somewhat inactive since the beginning of the year, the situation is a healthy one, and before new cheese is ready to be put upon the market, there is not likely to be a very large quantity of old stuff on hand to depress the market. The total shipments from Montreal and New York from May 1st, 1898, up to last week, (March 4) show a decrease of 554,274 boxes, as compared with the same period of 1897. The estimated stocks on hand on this side, are no larger, if as large as they were a year ago at this time, so that it is very likely all old stock will be worked off before the new goods are here. Dairymen, however, should make a special note of the fact that the British consumer is, every year, eating more meat, and does not rely so much upon cheese as a staple article of food as he once did. This being so, it will be necessary to have the quality of the goods sent forward of the very finest.

Factorymen connected with several of the local dairy boards of trade have met recently, to considered methods of disposing of next season's product. There seems to be a growing dissatisfaction on the part of factorymen with the present system of selling, and many of them are inclined to favor sending the product direct to the English dealer on commission without having it passed through the hands of the middleman as has been the practice heretofore. Nothing definite has been decided upon yet, and we are doubtful about anything being accomplished along this line till the patrons are more educated to it. There is, however, just enough unrest to show that considerable dissatisfaction prevails, in some sections, with the present system of disposing of the product.

Winter dairymen, taking everything into consideration, are having a very successful season. Prices have been well maintained, though the number of factories making butter has been nearly one-third larger than last winter. Until a few weeks ago the bulk of the winter butter was sent to Great Britain, where it sold for good remunerative prices, netting the factories from 19 to 20 cents.

Since the extreme cold weather, early last month, when the supply of milk fell off considerably, the local trade has taken most of the product; or rather, the local dealers were able to pay a higher price than exporters could afford. The ruling prices at Montreal, last week, (March 4) were from 20 to 21 cents for first class creamery. One feature in this winter's trade is that factorymen have been able to sell more of their butter outright to buyers on this side, and have not had to send so much of it over on commission.

The total exports of butter from Montreal, from May 1st, 1898, up to last week, show an increase of 94,224 packages over the same period a year ago, while the shipments from New York for the same period, show a decrease of 55,170 packages, making the net increase from this side 39,054 packages.

Subscription Price Saved Daily.

Following a Ration Formula Increases Yield of Milk.—Some Tennessee Dairy and Weather Notes.

ED. HOARD'S DAIRYMAN:—Enclosed you will find subscription for club of three, to whom please send HOARD'S DAIRYMAN one year. One year's reading it has convinced me that it is the best investment I can make. We have had Yankee weather during almost the entire winter. I use the word Yankee only to distinguish the north from the south. I am glad that we have no more north and south in the old sense, and that now, as our ex-Gov. Bob Taylor has recently said, Mason's and Dixon's line is only the dividing line between cold bread and hot biscuit.

The past winter, and especially the recent cold spell which sent the mercury below zero for five successive days, registering all the way from 13° to 22° below on 13th inst., has been the worst ever known in Tennessee and the entire south, and has taught us many things, not the least of which is to sympathize with our brother dairymen of the north and the more appreciate our usual mild winters of fair old Tennessee. Our dairyman said, during the cold spell, that his cows were not giving milk, but pure ice-cream. Although I have a splendid southern barn it availed very little good during the recent cold spell, for even the manure would freeze almost as dropped, but thanks to the HOARD'S DAIRYMAN it pulled me through with flying colors, and saved me *daily* the subscription price of the paper.

Money saved is money made. It was in this way: I had read so much about a balanced ration, so concluded would try it I followed a formula recently given in HOARD'S DAIRYMAN. This was begun about a week before the cold spell, and instead of falling off as usual during extreme cold, they actually increased. Your paper has helped me in many other ways, too. Often we have good grazing nearly all winter and do not feel the great need of a silo, but this winter has taught us to prepare for the worst instead of hoping for the best, and I expect many round silos will be built this year. Thanks to HOARD'S DAIRYMAN again for advocating the use of the silo.

The winter has taught us also that our wheat cannot be killed by extreme cold, but we hardly expect a full crop as the most of it was sown very late and has stooled very little. By reference to my diary I see that last year I planted all my early garden on February 9th, and finished breaking my corn ground on February 10th. This year not a furrow has been turned yet for anything, and to-day the ground is covered with snow, but "behind the cloud the sun is still shining". We welcome the brother from the north, but we hope you will keep your weather to yourself. I see some one asking in a recent number if he can make buttermilk from separator skimmed milk. I had the same trouble and found it impossible to make good old southern buttermilk. You ask me what is the difference between southern and northern buttermilk? I don't know that I can tell you, but there is a difference, and the best cannot be made after a separator. J. TAYLOR STRATTON.

Davidson Co., Tenn.

A Red Polled Record.

ED. HOARD'S DAIRYMAN:—I have a registered Red Polled cow (Ruby Twin) that will be ten years old, September 6th next, and weighs about 1,100 pounds. She dropped bull calf May 18, 1898, and is due to drop calf last of May, 1899. Will give you below, weights and tests of her milk, and hope you will be so kind as to let me know through your paper (in as plain form as possible) how much butter could be made from the milk during the year, if she gives the amount I estimate she will give, and the per cent fat between now and when she becomes fresh again the last of May next. We weighed the milk the last seven days of each month, except the month of September, when it was weighed a little before the last of the month. We have weighed each milking so far this year:

278¾ lbs. of milk last 7 days of May tested June 1, 3.8 per cent.
262 lbs. of milk last 7 days of June, tested June 30, 4.4 per cent.
180 lbs. of milk last 7 days of July, tested July 30, 5.6 per cent.
218¾ lbs. of milk last 7 days of August, tested August 30, 4.2 per cent.
179 lbs. of milk last 7 days ending September 26, tested September 26, 4.6 per cent.
151 lbs. of milk last 7 days of October, tested October 31, 5.6 per cent.
135 lbs. of milk last 7 days of November, tested November 30, 5 4 per cent.
142 lbs. of milk last 7 days of December, tested December 31, 6 per cent.
586¾ lbs. of milk 31 days January '99, tested February 1, 5.2 per cent.
343½ lbs. of milk first 19 days of February '99.
950 lbs. of milk before May 10 '99. (Estimated.)

The tests have been made with Babcock tester, by our butter maker at the factory, usually from morning milk. Her feed has been (since November last) clover and timothy hay, silage, bran and corn and oats (ground). Pasture mostly wild grass, that grows on river or creek bottom land. While weighing the milk in July, the feed was very short and flies very bad, also. I had her milk tested last April when she only gave 8 to 10 pounds a day and it tested 7.

S. S. CHANDLER, JR.

Waupaca Co. Wis.

The data given are not sufficient to allow more than an estimate on the total yield of butter for the year. But supplying average factors, when none are given, the calculations show that the yield of butter fat was 410.18 pounds, which would correspond to 462 pounds of butter. The above figures can be nothing more, however, than a very loose estimate, and the actual figures may be a number of pounds above or below those given above. The variations in the per cent of fat in a cow's milk, from day to day are so wide that nothing but daily weighing and sampling will give the actual yield of butter with anything approaching accuracy.

No More Scrofula

Not a Symptom of the Affliction Since Cured by Hood's.

"When our daughter was two years old she broke out all over her face and head with scrofula sores. Nothing that we did for her seemed to do any good. We became discouraged, but one day saw Hood's Sarsaparilla so highly recommended that we decided to try it. The first bottle helped her, and after taking six bottles her face was smooth and we have not seen any signs of scrofula returning." SILAS VERNOOY, West Park, New York. Get only Hood's because

Hood's Sarsaparilla

Is the best—in fact the One True Blood Purifier.

Hood's Pills cure nausea, indigestion, biliousness, constipation.

GLUTEN FEED.

CHAPIN & CO., Milwaukee, Buffalo, St. Louis, Boston. **Agents** for **GLUTEN FEED.** This feed is one of the best milk producers known, contains 27% digestible protein, keeps cows in healthy condition. Worth your attention in feeding economical rations. Sold in car lots, price based on its milk-producing value. Ask your grain dealer for price. Write our nearest office for full information.

There is nothing complicated about the CHAMPION Milk Cooler and Aerator—its as simple as a milk pail—easy to keep clean—easy to use—easy to buy. Our free book "Milk" is worth asking for.

CHAMPION MILK COOLER CO.,

67 Main Street, - - - - CORTLAND, N. Y.

JUDGE BURNHAM, of Kansas City, has decided a city ordinance that fixed the legal standard of cream at 20 per cent butter fat, to be unconstitutional because unreasonable. It is difficult to see just how the learned judge fixed his standard of reasoning. It used to be considered that it was only fair cream that was 25 per cent butter fat, or that would make one pound of butter to four of cream. If there was a law compelling the seller to sell cream by the test of butter fat, there would be no need of legal standard. In that case, the consumer could have the privilege of paying for just what he wanted.

SOMETHING ABOUT BUTTER FLAVOR.

At a recent meeting of the Elgin Board of Trade, there were exhibited four boxes of American butter, two of Minnesota and two of Wisconsin make, which had been exported to England, and there scored, then shipped back.

Two of the boxes, one from each state, were of poor flavor, or, as one man expressed it, "has an evaporated taste." These two boxes scored the highest of all in England, one 95, the other 96. The other two boxes showed much the best in flavor, but scored in England only 90 and 91. This showed that the butter with the lowest score had the best keeping properties.

At a recent convention of National Butter Makers at Sioux Falls, there was an interesting amount of kicking about the scoring. It was generally conceded that the average butter exhibited was several points off in quality, and "flavor" was where it chiefly lacked.

Robert Crickmore, Secretary of the Minnesota Association, says:

"The butter makers made the mistake of trying for too high a flavor. The result was that it was all gone by the time the judges got around to it."

Now here are two parallel cases, and the lesson to be drawn from each, is this:

This high, quick flavor so much desired, and which rules with the judges, is a sure accompaniment of short lived butter. It marks nearly the last stage of flavor before there sets in, as the next step, a disastrous change.

Should our judges give first premiums for butter, no matter how entrancing its flavor, if that is an indication of immediate loss in flavor, and consequent value?

Is not such judging misleading in its tendences, an education in a dangerous direction.

RAISE YOUR COWS.

To do this and to make sure you will have cows worth raising, provide yourself with a registered sire that has a strong line of dairy blood in him. H. L. G., a correspondent of the *National Stockman*, puts the matter in the right light when he says:

A dairyman must never depend on buying cows to run his dairy, especially if he intends making butter. When we first commenced making butter in a business way we depended on buying cows, but after we had bought some twenty, but one came up to what we called a standard cow. We paid eighty dollars for her. She never had a heifer calf for us. She gave rich milk and made sixteen pounds of butter a week when fresh. We milked her seven years and in all that time she never stood dry. We couldn't dry her up in any way. She had a calf each year.

We find in buying calves and raising them we get better cows than we can buy, which proves that it makes some difference how calves are fed.

Note this experience—but one of the cows in twenty that he bought came up to the capacity of a standard cow. A very successful dairyman of this vicinity once told us that he bought over one hundred cows in the endeavor to get a herd of less than twenty which would produce 200 lbs. of butter per cow. Now that is two thirds only of what a cow should produce if she is to be profitable.

Cows of only fair ability are selling now way above what they are worth as a real business investment. Think of it, buying cows as the milk dairymen of New York are doing, paying $40 and selling the milk at 1½ cents a quart. No wonder these men groan in spirit and pocket.

Everywhere is seen this loose, wasteful, unbusiness-like, undairy-like way of handling the dairy business. The old farmers of forty years ago knew better and did better than all this. They raised their best calves, and there was a snug, thrifty idea of managing all the forces of the farm, keeping up its fertility, *raising* good stock that made the country rich and prosperous.

It is a mistaken idea of economy when any man with a dairy of cows thinks he cannot afford to raise annually the best heifers and also provide those heifers with a sire that shall make them worth raising.

NUMBER AND VALUE OF MILCH COWS IN THE UNITED STATES FROM 1891 TO 1896.

	MILCH COWS.	
	Number.	*Value.*
Jan. 1.		
1891	16,019,591	$346,397,900
1892	16,416,351	351,378,132
1893	16,424,087	357,299,785
1894	16,487,400	358,998,661
1895	16,504,629	362,601,729
1896	16,137,586	363,955,545

The above computation, which is taken from the figures of the Department of Agriculture, shows that there has been a steady, though slow increase in the number of cows since 1891.

To the casual thinker, the small ratio of such increase will occasion surprise. For instance, the increase in four years, from 1891 to 1895 was only 485,039, while in 1896 the number actually decreased from that of the year before 367,043.

Of course this statement is but the estimate of the officials of the Department, but they have the best opportunity, and the most reliable data in the nation, upon which to base an estimate, and we may conclude that their figures are fairly accurate. These figures afford us an opportunity for looking at the actual drift of the dairy interest. The great fear of the average farmer is that the business will be speedily overdone, and the price of the cow product thus forced below the cost of production. As its readers well know, HOARD'S DAIRYMAN has never entertained such fears.

We have all along seen that the farmer had more to fear from under consumption, caused by hard times and the fraud of oleomargarine, than from over production.

The fact is, that if the cow can have full and free posession of the dairy market, without being obliged to meet the competition of fraud, there will be no danger of overproduction. Only one-half of the calves born each year are females, and but a small per cent of those ever reach motherhood and enter into dairy production. On the other hand, every child that is born continues through its life to be a consumer of cow product in some form or other, or in all forms.

The cost of production, which of course decides the amount of profit which is left in the pocket of the cow owner, is determined not so much by the market price of butter and cheese, as by the intelligence of the cow owner and the capacity of the cow. Put a *good* cow and an intelligent owner together, and more profit will be derived at low prices, than with a poor cow and ignorance with high prices. It is because of this great truth that HOARD'S DAIRYMAN preaches so incessantly upon the necessity of breeding up the quality of the cow, and at the same time increasing the intelligence of her owner. However, the better cow will begin to appear when the owner begins to grow in dairy intelligence, for better breeding and handling are invariably the outcome of such a growth.

The average value of the cows of the United States, as shown by the figures at the head of this article, was $21.62 in 1891; $21 41 in 1892; $21.96 in 1895, and $22.55 in 1896.

The cause of the marked falling off in the number of cows in 1896 is hard to determine. The high prices for veals no doubt has caused the death of many a likely heifer calf. It is a fact, however, that as the number of cows increases in any given territory, the number of heifers that are raised to cowhood decreases in like proportion. About Elgin, Ill., for instance, where exists a very dense cow population, but few calves are raised in proportion to the number of cows in existence. The farmers in that region depend mostly for their cows on buying from outside sections.

There is no doubt but that the price of good cows, or young heifers from well bred dairy lines, will continue to range high for years to come. For this reason we have urged our readers to pay more attention to the purchase of registered bulls of some one of the four dairy breeds, Ayrshire, Jersey, Holstein or Guernsey.

There is no difficulty in securing a handsome price for a likely young grade heifer of any of the above breeds. If the local price is not satisfactory, a small advertisement in the DAIRYMAN will soon bring the desired purchaser. Several car loads of such heifers have gone out from this section to distant states, in response to such advertising.

The value of the skim milk fed to such heifers would amount to over 40 cents a hundred, figured by what they consumed, and the prices received for them. But the chief value was derived from what the sire imparted, thus showing the wisdom of securing good parentage for a heifer, if one wishes to dispose of her or keep her for future use.

There is every encouragement for the dairy farmer who will try to be wise enough for his business. But the day is past when farmers can make a profit in dairying with a poor cow, the result of breeding without sound dairy intelligence.

A CANADIAN SUB-EARTH DUCT.

HOARD'S DAIRYMAN was the first paper in the world to bring to the notice of the cheese making public the utility and value of the sub-earth duct for tempering cheese curing rooms in hot weather. This it did way back in 1876,7,8 and 9. We have ever since been a persistent believer and pusher of the idea, and expect to be for all time to come. So we make no apology for calling attention to the following description of the duct now in use at the Ontario Agricultural College, at Guelph, Ontario, which we take from *Farming*:

"The duct is about 90 feet long, 6 feet deep at one end, 6½ feet deep at the other, to allow for drainage. In the trench were placed six rows of six-inch drain tile. Three rows were placed in the bottom and three rows directly on top of these, breaking the joints four inches. On the top of the tile was placed eight or ten inches of shavings, and then the dirt was filled in. At each end of the duct was placed a curb about three feet square. These curbs fit over the top of the tile in such a manner as to prevent the dirt from entering the end of the tiles. At the inlet end of the duct is a galvanized iron pipe 30 feet high, and 14 inches in diameter. On the top of the pipe is a hood or cowl, which turns towards the wind at all times. A constant stream of air enters the pipe, passes through the tile, and on its way to the curing room becomes cooled about 20°. The inlet of air to the curing room is regulated by means of slides. The warm air is taken from the room, through a ventilating shaft, which passes from the ceiling to the roof, and there connects with a galvanized iron pipe, which is 12 inches in diameter and 15 feet in height from the roof. The top of the pipe is covered with a cap to prevent rain entering the room. The inlet for the air should be at one side of the room, and the outlet at the opposite side, so as to change all the air in the room. The total cost of the duct was about $65 for a small room. For an ordinary curing room the duct should be 150 to 200 feet long, and from 8 to 12 feet deep, if at all possible, as this furnishes a supply of cooler air than the shorter and shallower duct. The curing-room should be insulated by lining the room with two-ply building paper, then nail on 2-inch strips, and then a lining of matched lumber. The floor, walls and ceilings should all be lined. The results of experiments conducted at the dairy school show that there is a marked improvement in the quality of the cheese cured at an even temperature of 60 to 65° F. Assuming that an increased value of the cheese is obtained of ¼ of a cent by proper curing methods, which is not out of the way, the value of the make of a 100-ton factory would be increased by $500. The loss by shrinkage in curing cheese at a high temperature was over one per cent, as compared with a low temperature. This, on a 100-ton factory, would be 2,000 lbs., which at 8 cents would be $160. It would, therefore, pay every factory in dollars and cents to have the curing-rooms fitted up so that the temperature could be controlled."

THE EVOLUTION OF THE DAIRY COW.

At the recent meeting of the Connecticut Dairymen's Association, Prof. C. S. Phelps, of the Storrs College, gave a very interesting address on the "Evolution of the Dairy Cow." The following is that part of the address which shows how this evolution affects New England and the older dairy districts of the country, and, farther, how it has developed breeds of cattle of definite dairy quality.

Dairying, as a special branch of farming, in New England, is the outgrowth of a changed condition of agriculture. In the early history of the east, a mixed system of husbandry was almost a necessity. Each farmer was obliged to grow, practically, all of the food and clothing used by the family. Under this system a general-purpose cow was developed. With an abundance of pasturage through the spring and summer, she could be made to furnish a sufficient quantity of butter and cheese to supply the family for the year. If needed for beef, she could be "dried off" in the fall, and fattened at pasture, with the aid of corn. Little, if any, effort was made to produce butter during the winter months. Hay alone was fed at this season, and if the herd gave what milk was wanted as food for the family, it was about all that was expected. The male animals could be fattened as steers, or developed into valuable work cattle. Conditions are now entirely changed. With the opening of fertile areas in the west, where grain can be cheaply grown, New England is no longer able to hold the markets for beef. The clearing up of fields from rocks and stumps, and the use of improved machinery, have afforded conditions more favorable for the horse than for the ox, for most kinds of farm work.

With these changes the general-purpose cow was no longer needed on the farm. A special-purpose cow for milk, or butter, or both, began to be looked for. It was found in the older countries, where the high value of dairy products had been longer appreciated.

The Ayrshire breed, while not especially common in Connecticut, is worthy of a high place as a milk producer. Professor Phelps called the Ayrshire a typical dairy cow. Few breeds will produce milk more economically than the Ayrshire. Jerseys and Guernseys were also highly spoken of by the professor. Some of the best foundation stock of these breeds was imported to or developed in Connecticut. The Jersey breed, unfortunately, has been reared, in the past, too much for fancy points. The Guernseys differ from the Jerseys, mainly, in size, averaging about 150 pounds heavier, and in the color of their butter. There is very little call for artificial coloring of the Guernsey butter. This breed is yearly gaining in favor.

The Holsteins as milk producers outstrip any other of modern breeds. But as a breed their milk is not of the highest quality for butter production, but what it lacks in quality is often more than made up in quantity.

The milk producing cow of today is an artificial development. Her power to elaborate milk far exceeds what nature designed. This unusual development of the milking function has also favored the development of the nervous system. In the end, raisers must come down to the matter of selection and individual merit as indicated by productiveness as the true basis upon which to build up the herd. The matter of selection may apply equally well to the selection of ordinary grade stock as well as the selection of animals for breeding. The digestive and assimilative capacity of the animal and the nervous system are points which seem to be of greater significance than has been given to them in the past. The two points which most strikingly indicate a nervous development are a broad, clear, prominent eye and a loose open condition of the spinal column with a prominent pelvic arch. A cow of a decidedly nervous "make up" is almost always thin in flesh. But if in connection with a strong nervous temperament she also has a powerful digestive system she will turn her energies almost entirely to the production of milk and butter.

THE Minnesota Legislature is considering a bill to appropriate $20,000 to be expended during the next four years at the rate of $5,000 a year to encourage the art of butter and cheese making in the state. There is no doubt but if such an appropriation was made, it would return to Minnesota a hundred fold in actual worth.

WE have in hand for publication next week, a perspective view and ground floor plan of a dairy barn, built in this vicinity last season, which may afford some valuable suggestions to those dairymen who contemplate building a barn in the near future.

We also have coming for early publication, detailed plans for building the so-called plank frame barn. The plank frames save quite an item in cost, both in lumber and labor, and are appreciably stronger than the old style of timber frames.

THE report of that Michigan herd which produced an average of 6,608 pounds of 5% milk per cow, comes in good time to supplement, confirm and apply the facts brought out in Mr. Beach's analytical statement of the Storrs College herd. If it would not throw the editor of the *Breeder's Gazette* into a spasm of abusive speech, we would like to inquire what process of breeding on the dual-purpose plan he would pursue to produce a square-ended herd of such cows? But perhaps we should not tempt the weak beyond their strength.

PREPARE FOR THE WORST, NOT HOPE FOR THE BEST.

That is a very suggestive and instructive letter that is written by Mr. J. Taylor Stratton, of Tennessee, on page 104. Speaking of the good he got out of HOARD'S DAIRYMAN, the present winter, in the case of his cows, he strikes a thought, or the phrasing of a thought, that impressed us greatly. He says the present winter has taught him "to prepare for the worst, instead of hoping for the best." That is the reason he will provide himself "with a silo." A good silo well stored with the finest milk feed in the world, enables a man to prepare for the worst, and not only hope for, but secure the best."

That is the difference between a thoroughgoing, real, business dairyman and one of those half hearted, general-purpose fellows, who never prepare, but always hope. They are an easy, happy-go-lucky sort of men. It is easier to hope than it is to prepare. It is easier to trust to Providence than it is to build a silo. It is easier to hope for good luck than it is to calculate and work for it. And so they live along with poor cows, poor effort, poor calculation and poor return. Still they hope. But they will not build a silo, and so be prepared for the dried up pasture that will likely come next summer. Season after season are they caught in this way to the destruction of profit, but still it is so much easier to hope than prepare.

ANOTHER FORCIBLE LESSON.

HOARD'S DAIRYMAN has been preaching the solid truth, dairy cowology, for many years. We don't theorize, except on the basis of hard facts. When Prof. Haecker, of the Minnesota Experiment Station, made his trial for one year, with the herd of that Station, the DAIRYMAN went to the expense of having each cow placed before its readers in her own likeness. Prof. Haecker gave the record of each cow, just what she made, either profit or loss, and what her butter cost per pound. Then the story of her dairy form and temperament was told. As usual, the profit was found with the *dairy cow.*

Now we come again with another story of the same character from the Storrs Experiment Station, of Conn. Here are given the pictures of the cows, the tables of all the facts of their work for the year, and again it is proved that the "dairy form" and type is the winner in profit making. There are deep and valuable lessons in these illustrations—lessons for the Jersey, Guernsey, Ayrshire and Holstein Associations to consider in the outline they will give to their respective breeds of cattle; a lesson that dairy cows must be bred for dairy performance and all scales of points must *point* toward dairy results, not an empty breed type or characteristic which has no significance for dairy work. Here is also a lesson to the dairy farmer, telling him to study the cow more, learn more, read more, fill up more with useful judgment and understanding on the cow question.

One thing is clearly proved: *It is the cow herself that determines whether the feed shall be used for profit or loss.* Let us not forget this great basic truth.

Relative Value of Cream and Milk for Butter Making.

ED HOARD'S DAIRYMAN:—I do not quite understand your answer to my question in the DAIRYMAN of Feb. 24. I wrote to Prof. J. A. Van Wagenen, of Cornell University on the same subject and this is what he wrote in reply:

"A farmer who delivers cream instead of milk should be allowed at least 3 per cent more for each pound of fat delivered, for this reason: a separator will, on the average, leave in milk at least one tenth of one per cent of the fat originally present. This is, of course, just so much direct loss to the creamery. Or you may state the case in this way. The man who delivers a pound of fat in the form of cream enables you to put a full pound of fat in the churn, while on the other hand, the man who delivers you a pound of fat in the form of milk will enable you to put only about 96 or 97 one hundredths of a pound of fat in the churn. The man who brings cream has already met the necessary loss in skimming while the man with milk throws the loss on the factory. And when you consider that he has also saved the factory the trouble and expense of skimming the milk, it seems to me that 3 per cent is not enough as compared with the other party. I suggest that he should have at least 5 per cent more per pound of fat than the man who delivers milk."

In your answer you say we need not bother about the loss in skimming if we use the Babcock test on the cream. I would like you to explain that when seven or eight farmers' milk has been mixed and run through the separator, how the amount of butter fats each is entitled to can be determined by the Babcock test on the cream, when the milk does not test the same. EUGENE SHELP.

New York.

The Professor is theoretically correct. That is to say there is a (variable) loss in extracting or separating the cream from the milk which falls upon the farmer when he delivers cream and upon the creamery when milk is delivered. In the case of milk containing only 3 per cent of fat, this loss of one tenth of one per cent fat in the skim milk will approximate 3 per cent of the total fat, but with 6 per cent milk this loss will be only about half as much, because there will be only half as much skim-milk for the same amount of total fat and in these proportions for other qualities of milk.

For example: 2,000 lbs. of 3 per cent milk will yield, say 236 lbs. of cream containing 58.236 lbs. of fat and 1,764 lbs. skim-milk containing 1.764 lbs. fat, whereas 1,000 lbs. of 6 per cent milk will yield practically the same amount of cream, containing 59.236 lbs. of fat and there will remain only 764 lbs. skim-milk and in it there will be only 0.764 lbs. of fat.

If a creamery is fully equipped to handle all the milk that may be offered to it, the extra cost of separating a few hundred pounds of milk is practically nothing; whereas the extra trouble of taking in, sampling and caring for a few scattering deliveries of cream fully offsets the small gain of one half to one pound of butter fat in the cream from a thousand pounds of milk.

If all the patrons were to deliver cream, thus doing away with the necessity for installing, running and maintaining separators and milk vats, the case would present a different aspect.

A Michigan Dairy.

Balanced Ration—Better Cows—Warm Stables—Cream Ripening.

ED. HOARD'S DAIRYMAN:—After waiting so long I will comply with your request and tell you something of our dairy and how it is carried on.

To begin with, I have only been dairying for about three years. I came on to this farm five years ago. It had been pretty well run, and had been rented on shares for some time, and you know that that is not the fastest way to increase fertility. But the foundation is good, the soil being clay loam (rather too much clay).

Well, I went to work in the old rut plowing and sowing and I tell you it was up hill work and I would have sold out for a song. I made up my mind that I must make a change or go under. I subscribed for the *Practical Farmer* and got interested in clover and tillage. Then I subscribed for HOARD'S DAIRYMAN and got interested in cows.

After reading HOARD'S DAIRYMAN a while I made up my mind that dairying was the thing for me.

We had four or five common scrub cows that never had any grain and went dry most all winter. I bought two cows and put them with what I had and began sending milk to the creamery. I felt like quite a dairyman but some way I did not get rich very fast.

All this time I was reading HOARD'S DAIRYMAN and I saw that there was a great deal said about testing each cow, so I had my cows tested and found that most of them were running me in debt instead of making money. I finally sold all but one and replaced them by buying two good cows and one heifer of my own raising.

The cow that I kept made, in 1895-6, 265 pounds of butter with grain once a day. By this time I had the balanced ration idea in my head and began to practice it in my herd. The result was, in 1896-7 the 265 lb. cow made 354 lbs. butter and gave 7,401 lbs. of milk, but it was not all feed. I had learned to keep them warm and give them plenty of water twice a day and salt once a day.

The two cows that I bought made 350 and 294 lbs. of butter; the heifers' milk was not weighed regularly so I could not tell exactly how much butter they made. Others were bought and sold so I could not keep their record for the year. But still I didn't get rich very fast, I was not getting enough for butter to make it pay very big.

The idea to make and sell butter myself and sell to private trade, came to me, and I acted upon it and on the first day of January I began to make butter, tending to everything myself, using Cooley cans; sold the butter to private families at 20 cents by the year. Then I began to realize something out of the milk. That went all right until my ice, of which I had forty tons, gave out. Then I took another step and bought a cream separator last fall. I also built a creamery and ice-house combined. In the creamery you will find the separator, a 25 gallon barrel churn, a 25 lb. Reed butter worker, a six bottle Babcock tester, a large ice box and everything handy for making first-class butter.

In the barn the cows are kept warm and clean, lots of straw being used as bedding. We are careful to milk with clean hands and have the cows clean. The milk is run through one metal and two cloth strainers and then through the separator. Before the warm weather comes I am going to have an aerator for the cream to run through directly from the separator.

I am very well satisfied with my business now, only I want better cows. I have, at the head of my herd, a son of Lorita's Marigold Pogis, 43972; a bull of special merit as to dairy form and color.

As to breeding up my own herd, I have been unfortunate in having bull calves but have some very promising heifers growing now.

My dairy is now a winter dairy, most of the cows coming in in the fall. I think that I can make 100 lbs. more butter from a winter cow than from the same cow in summer.

So you see that from a discontented farmer, by reading HOARD'S DAIRYMAN and trying to profit by what I read, I now am contented and have a business that is both pleasant and profitable. My farm is gaining in fertility every day and by raising clover and saving all manure, I expect in a few years to have the old farm back to its former state of fertility.

You ask for experience in ripening cream. I have no trouble. I ripen it in just twelve hours every time and believe in quick ripening with a pure starter. I keep my cream cold until the night before churning day, then I warm up to 70 degrees by putting the can into a pail of hot water and stirring until warm enough, adding starter before warming. I use butter-milk from the previous churning if the flavor is all right. About once a month I make a new starter by taking two quarts of whole milk, run through the separator, and holding it at about 80 degrees till sour.

I send you one of my trade marks which is pasted on every jar of butter before it is delivered and is a guarantee of the contents.

In conclusion would say, keep good cows; take good care of them; feed a balanced ration of good, wholesome food; find a profitable market for your product; take HOARD'S DAIRYMAN, and you are sure of a good profit in your business. FRED M. LUTHER.

Ottawa Co., Mich.

WHAT about the frequent assertion of HOARD'S DAIRYMAN that the *dairy* cow is a valuable animal to have on the farm, and that it does not pay to milk any other? For answer read Mr. Beach's report on pages 112 and 113, of the Storrs College herd, and study the illustrations and tables which accompany it.

W. N. I., of Deans Corners,

New York, writes:

"I can credit Hoard's Dairyman with saving a valuable Holstein heifer and I also gave my neighbor an idea which he said saved his cow, One of his cows died and he said if he had known then what I told him it would have saved her also. Why will not dairy farmers invest one dollar for so valuable information ?"

Sure enough, why ?

It will take but a minute to write your name and address on a slip of paper, enclose a dollar and send it to the post office. Lots of witnesses tell you that it will pay you grandly.

"Now is the accepted time." TRY IT.

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name, Post-office and state of writer. Condense the questions into plain specific inquiry. Be careful to note if your questions have not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

GLOSSARY.

The terms used in this department of HOARD'S DAIRYMAN have the following significance:

RATION.—The total allowance of feed for twenty-four hours.

DIGESTIBLE NUTRIENTS.—That portion of the organic matter which can be digested by the animal and does not pass off through the bowels as excrement.

PROTEIN.—That part of the digestible nutrients which goes to the formation of lean meat, ligaments, hair, horns and the casein (or curd) of milk. It is generally believed, also, that protein may be, and many times is, converted into the fat found in milk. The basis of protein is nitrogen, hence the protein elements are frequently termed the *nitrogenous* parts of the food. They are also called *albuminoids*.

CARBOHYDRATES.—That part of the digestible nutrients which is the primary source of sustaining animal heat and furnishing the power for keeping the animal mechanism in operation. They are composed of the woody fibre of the plant and grain, and the starch, sugar, gums, etc, and in the published tables of chemical analyses are usually subdivided into the terms *crude fibre*, which is the least digestible portion of feeding stuffs and *nitrogen free-extract*, so-called because it does not contain any nitrogen.

ETHER EXTRACT.—That portion of the digestible nutrients which may be dissolved out of the food stuffs by ether. It is frequently called *crude fat*. Whether fat is actually digested and thus passed on into the circulatory system in a changed form, or whether it is simply separated from the other elements and always maintains its identity is an unsettled problem. It can be used by the animal for maintaining the body temperature, and for this purpose is from 2.2 to 2.5 times more efficacious than the carbohydrates. It is maintained, by some, that the fat in the milk comes, largely, from the crude fat in the food, but it has been demonstrated that it is not absolutely necessary for this purpose.

FEEDING STANDARDS FOR MILCH COWS.

Dry matter.	DIGESTIBLE NUTRIENTS *Protein*	*Carbohydrates.*	*Ether extract.*
lbs.	lbs.	lbs.	lbs.
23 to 28	2.0 to 2.5	12. to 15.0	0.5 to 0.8

WEIGHT OF A QUART OF MILK.

Will you please tell me how much a quart of milk weighs? L. L.

Jacksonville, Ill.

A quart of milk weighs 2.15 pounds.

COATING FOR PINEAPPLE CHEESE.

Can you inform me of what composition the coating of pineapple cheese is? Is it a commercial product, and if so, where can it be obtained? W. J. B.

Bay City, Mich.

We do not know that any special coating is used. Willard states that the smooth surface is given them by hand rubbing with sweet whey butter during the process of drying.

A MISSOURI RATION.—THE CREAM TEST OF MILK.

Will you kindly give me a balanced ration for a young cow that is giving thirty-five pounds milk daily. Have the following feeds: Bran, shorts, gluten feed, cotton seed meal, corn meal and oil meal and plenty of clover hay. I have no Babcock tester, but the milk from this cow tests 23% cream. B. C. S.

Palmyra, Mo.

This "cream test" is one of the most misleading things ever suggested to dairymen, except for comparing one cow with another when all the conditions are identical. If a tube of freshly drawn, warm milk is set in ice water, it will apparently show more cream at the end of six hours than when twelve or twenty-four hours have elapsed. Cream is simply a mixture in varying proportions of "skim milk" and "butter fat." The fat being of less specific gravity will continue to rise nearer and nearer to the surface and the milk serum, or skim milk, obeying the same law of gravitation, will tend to leave the upper levels. Thus the line of demarkation between the cream and the skim milk will tend to rise until the cream becomes so thick that the imprisoned serum cannot escape.

There is also a variance in the milk of different cows and of the same cow at different periods in lactation, in the readiness with which the cream will rise, by reason of difference in viscosity and the size of the fat globules.

We suggest the following daily allowance of feed:

FORMULA FOR RATION.	*Dry Matter.*	*Digestible Nutrients* Protein.	Carbohydrates	Ether Extract
20 lbs. clover hay.....	16.94	1.24	7.16	.34
4 lbs. bran.....	3.52	.50	1.54	.12
4 lbs. gluten feed.....	1.84	.41	.97	.06
2 lbs. corn meal.....	1.78	.16	1.33	.09
Totals.....	24.08	2.31	11.00	.61

In addition feed some corn stover or straw or more hay, if it will be eaten.

AN INDIANA RATION DISCUSSED.

Have six grade Jerseys (four fresh and two strippers) weighing 800 to 1,000 pounds. Ship butter to Cincinnati and receive 18 cents a pound throughout the year. Please suggest a balanced ration from clover hay and corn fodder (which we cut half and half in cutting box), bran at $15, cotton seed meal at $18 and corn of our own raising which we grind at home, cob and grain together. Also would it pay me to get a separator for eight cows next fall? M. B.

Delaware, Ind.

This inquirer reports that he is feeding at present four gallons of corn and cob meal and bran and two pints of cotton seed meal, but whether to one cow or the six is not stated. As this amount of feed would weigh nearly eighteen pounds, we incline to the opinion that it is the total allowance for all the cows. If this is the case, the amount is as much too small as it would be too large for one cow.

A fair ration (see glossary at head of this department) for the fresh cows would be four pounds of bran, four pounds corn and cob meal, two pounds cotton seed meal, and all the clover hay and stover they will eat. The "strippers" should receive less, and in proportion to the amount of milk they yield. Such a ration would tabulate about as follows:

FORMULA FOR RATION.	*Dry Matter.*	*Digestible Nutrients* Protein.	Carbohydrates	Ether Extract
12 lbs. clover hay	10.16	.82	4.30	.20
10 lbs. corn stover....	5.95	.17	3.24	.07
4 lbs. corn and cob meal.....	3.56	.26	2.52	.14
4 lbs. bran.....	3.52	.50	1.54	.12
2 lbs. cotton seed meal	1.84	.74	.34	.24
Tota's.....	25.03	2.49	11.94	.77

It is probable that most of the cows will require less hay than specified above, and in all cases no more should be placed before any cow than she will clean up with relish. It is folly to waste good fodder, by allowing cows to "nose over" what they do not care to eat.

Give a little salt every day, or better yet, with every feed. Salt is not only an appetizer, but an aid to digestion and assimilation.

We consider a herd of eight cows as constituting about the dividing line between the gravity and separator systems of creaming. Unless the facilities for gravity creaming are of the best, we think a separator would be a profitable investment.

SILO QUESTIONS.

Which keeps silage the best, stone or wood? Silo to be round, 30 feet deep, with 6 feet below surface, what diameter for 50 cows with room for increase and some silage for summer feeding? Are round stone silos satisfactory? What distance should I build from barn to fill from barn floor 16 feet of silo being below cutting box and 14 feet above?

Purcellville, Va. H. P.

Fifty cows for 180 days will require 175 tons of silage. This will require a silo 30 feet deep 20 feet in diameter. If you intend to feed in the summer it would be better to build two smaller silos 30×16 feet each.

The closer you build to the barn the better. Otherwise there is too much work in handling the silage for feeding.

If a stone silo can be made air and water tight, there is no difficulty in having the silage keep. The early objection to stone silos was, it now seems, due to the stone being porous and admitting the air, which caused the silage to spoil. If the inside of the silo is given a smooth coat of cement, the air is prevented from entering and the silage keeps well.

FOR COWS IN FULL FLOW OF MILK.

Will you please balance me a ration. The feeds I can get are, wheat bran, gluten feed, chopped feed, Quaker dairy feed and clover hay. If there are any that ought to be added, or left out, let me know. I have been feeding 20 pounds clover hay, 5 pounds chopped feed, 4 pounds bran, 1 pound oil meal. Do you think it would pay to add some other concentrated food, like gluten meal, Quaker dairy feed?

My cows are grade Jerseys, and weigh 1,000 pounds, and in full flow of milk.

Jacksonville, Ill. L. L.

The ration as now fed tabulates as follows:

	Dry Matter.	*Digestible Nutrients* Protein.	Carbohydrates	Ether Extract
20 lbs. clover hay...	16.94	1 34	7.16	.34
5 lbs. (corn) chop....	4.45	.40	3.33	.22
4 lbs. bran.....	3.52	.50	1.54	.12
1 lb oil meal.....	.91	.29	.33	.07
Totals.....	25.82	2.53	12.36	.75

We cannot suggest any improvement upon this ration, as an average for a herd, from the standpoint of productiveness, if the "chopped feed" is ground corn, or oats and corn ground together. If it is something else, as, for instance, a mixture of corn and *oat hulls* from some mill where oat meal is made—as is very likely to be the case if it is a feed shipped in by some feed merchant—no one can tell what its feeding value is.

Whether equally good results could be obtained at less cost, by using some of the other feed stuffs named, cannot be determined without knowing the local prices.

We invite special attention to the expression "as an average for a herd." A herd of cows should not be fed a uniform ration, because it is impossible to gather a number of cows together that have a *uniform* dairy capacity. It is manifest that a cow which yields only one pound of butter per day, requires less material to make that butter from, than when she yields one and one-half or two pounds per day, just as the horse at moderate work requires less feed than when at heavy work. In other words, cows should be fed with due regard to the returns and use they individually make of the feed given them.

It would be very strange indeed, if some of the cows in L. L's. herd would not do fully as well if the grain allowance was reduced from two to four pounds; and it would be equally strange if some of them could not profitably use more feed.

The report of the Storr's College Herd, which we publish this week, fully illustrates and confirms this statement.

RICHNESS OF CREAM AND THE SEPARATOR.

Can a separator be so gauged that only a certain per cent of cream is allowed to remain in the milk, thus enabling a dairyman to send out a uniform milk, and still be able to deliver cream too? Unless the milk from all the cows can be mixed (which is impossible if there are many) then some customers would receive richer milk than others.

If the separators can be so gauged to do the work, then the difficulty would be overcome. M. H.

Louisville, Ky.

It is very doubtful whether the separator could be depended on to do the work in the manner you wish without costing more than it would come to. Your circumstances may be different from other milkmen, and thus prevent you from mixing and blending your milk; otherwise we can see no possible objection to the use of a suitable milk vat for receiving the milk from all the cows and then adjusting the per cent by means of the separator—a, by no means, difficult task.

BITTER MILK.

I would like you to tell me the cause of milk getting bitter in the winter, when the cows are young and healthy, and are fed on clover hay, corn meal, middlings, cotton seed meal and have plenty of salt twice a day. C.

Louisville, Ky.

Bitter milk is caused by too long keeping at a low temperature. It is frequently noticed in winter, when advantage is taken of the cold weather to keep milk or cream for a number of days. If the milk is kept below 40° but not frozen, the low temperature prevents the growth of the lactic acid ferments, but not that of the bitter producing species. It is often observed in cooked milk. In summer, bitter milk may be caused by the food, more especially certain weeds.

VARIATION IN PER CENT OF FAT UNDER THE SAME CONDITIONS.

Why is it that in different barns on my farm, where we have the same type of cows, that are fed on the identical same food, that at one the milk tests from 4 to 4.10 and 4.20%, while at the other it runs 3.60 to 3.80%.

I repeat that the cows are as near alike as could be possible as to grade and type, and the food is of the same ingredients; one foreman, however, feeding quite wet, while the other rather only damp than very wet, but his cows being allowed to get all the water they want; and I think we can say that the one who feeds wettest produces the most milk, his, of course, being the lower test. And I would want to know whether all this affects the butter fat. M. B.

St. Louis.

Individual cows vary widely in the composition of their milk. This is especially shown in the per cent of fat. No two cows will give the same amount of milk and per cent of fat, even when the food, water, keep, and type of cow are the same.

So long as each animal receives all the water they require—and that is a large amount when in full flow of milk—wetting the feed is only an increase of labor. The cow has time and facilities for wetting the feed herself.

The amount of water used, under conditions, given by you, will not affect the butter fat. That depends on the individual cow, period of lactation, etc.

MINNESOTA QUERIES.

Why is not separator cream good whipped cream? Do I skim it too thick or too thin, or what is the cause?

Would you advise me to build a silo, or would it be just as good to cut the fodder and feed it dry or steam it? I am thinking

of getting a power to do my work with. If I get a steam engine, after the feed is cut, I could steam it from the engine. One of my neighbors, who is the best butter maker in the country, his cows seventeen in number, averaged 342 pounds of butter apiece last year. He had a silo and tore it out, cuts his fodder and feeds it dry. He claims that it is less work and just as good as a silo.

I am now feeding good red top and blue joint hay, ground barley and oats with some bran and a little oil meal. Would you feed oil meal to all the stock when they are fed on wild hay? (MRS.) J. D. H.

Hugo, Minn.

Separator cream should whip as well as cream raised by any other methed, if the temperature and per cent of fat are right. It should contain 20% of fat and be whipped at low temperature.

Build a silo by all means. There is less loss of feed, less labor required and more economy than in handling and feeding dry fodder.

Your neighbor's experience is contrary to that of hundreds of dairymen who have silos. He certainly cannot feed dry corn fodder without more labor and a greater loss of food than in a well made and filled silo.

Oil meal is always in order, but present prices are almost prohibitory. If you had silage or roots, or anything that would keep the bowels in good order, you would not need the oil meal, although it would still be a good feed.

COW PEA SILAGE—BANK BARN.

I made a small silo last year. It was only 10×10 and made of 2×4, stave fashion. Put on building paper, then lined with tin. Put my cow peas into it and had fine feed as as long as that lasted. I want to build a large one this year and fill both of them this fall. I want to plant some kafir corn this spring. Have not tried any of that yet for silage. I see by your paper that it makes good silage.

What do you think of a bank barn. I am thinking of building one this summer. Have a good place for one and would like to hear from some one in regard to that kind of a barn. J. W. K.

Ind.

It is expensive and quite unnecessary to line a silo with tin.

A bank barn is all right if sufficient provisions are made for light and ventilation.

CARROTS VS. BEETS.

I have been informed that large yellow carrots are better than beets for milch cows. Did you ever feed them, and would you try them? E. C. H.

Cresco, N. Y.

Carrots have a slightly better feeding value than mangels, but there is but little difference between them. They are too watery to be fed as the bulk of the ration, but are useful as appetizer and succulent food.

QUANTITY OF SEED OATS PER ACRE.

Have you ever tried light and heavy seeding of oats? For irrigation I sowed 30 pounds of wheat per acre and raised as high as 32 bushels, machine measure, but as I am a sort of a tenderfoot in this country would like to know about amount of oats to sow with drill—not broadcast.

Have raised nearly 70 bushels of oats with less than a bushel of seed in Colorado.

Ills. F. S. Cook.

The usual custom in this part of the country is to sow from 2½ to 3 bushels of oats per acre. Doubtless less would answer in some seasons. When one changes locations he can seldom do better than to follow the custom of his new neighbors in matters of this kind for his general crop, and experimenting in a small way with decided departures therefrom.

A MEXICAN FEEDING PROBLEM.

Mr. J. R. Arroyo writes us from San Louis Potosi requesting a formula for ration from corn stover, wheat bran, corn, cotton seed meal, brewers' grains (wet), corn bran, (wet from starch factory), barley straw and barley. He writes in Spanish and adds something about alfalfa and selling good milk. We are sure he could have made his meaning quite clear to us if he had attempted to write in English even if his construction had not been entirely correct. We appeal to him to try English next time, with the assurance that we have had too much experience with other nationalities in attempts to master the intricacies and difficulties of our language to take note of the mistakes.

There is no objection to feeding either the wet grains or the wet starch feed, so long as it is fresh and sweet. But these kinds of feed should always be stored in perfectly water tight boxes or casks and fed from water tight buckets. Otherwise the drainage on the floors or in the mangers will afford the best of material for the propagation of bacteria, which may in this way injure the milk. The prejudice and objection to these feeds come more from these external sources of contamination than from their internal effect when eaten by the cow.

We do not know that there is any particular choice between the brewers' grains and the starch feed, and presume they might be interchanged without occasioning any disturbance and we therefore suggest as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
10 lbs. stover	5.95	.17	3.24	.07
10 lbs. barley straw	8.58	.07	4.12	06
20 lbs. brewers' grain	4.86	.78	1.86	.28
4 lbs. bran	3.52	.50	1.54	.12
2 lbs. corn	1.78	.16	1.33	.09
2 lbs. cotton seed meal	1 84	.74	.34	.24
Totals	26.53	2.42	12.43	.86

It is doubtful if all the cows will eat the full amount of stover and straw above specified and this is not material. Give each cow what she will eat.

COW PEAS.

I have seen considerable in your paper about cow peas. They seen to be unknown here. (1) How are they different from common Canadian peas?

(2) What kind of soil do they require?

(3) Where can they be obtained, and what price per bushel?

(4) How much seed per acre and when best sown?

(5) Is it best to sow alone, or with oats? Michigan. A. J. H.

The "cow pea" is in fact not a pea at all, but a bean, and very susceptible to injury by frost. It is as yet a semi-tropical plant and of doubtful availability in the climate of Michigan and Wisconsin. It is probable that early maturing varieties will be developed in the near future. Indeed, such are advertised now, but we hesitate to advise sowing any considerable areas to the cow pea north of central Illinois. Any of the large seed houses, like Ferry, of Detroit, or Dickinson in Chicago, would furnish seed. Correspond with them for prices and amount of seed per acre.

OATS AND PEAS FOR SILAGE.

Will you please inform me in regard to siloing oats and peas (Canadian field peas) equal parts of each. Can it be done successfully? If so, what is its feeding value, and can it be fed to any advantage with corn silage, (say one feed of each a day) and other food to form a balanced ration?

Mecklenburg, N. Y. L. C.

Oats and peas make excellent silage, but to feed this in alternation with corn silage would require two silos, and thus expose twice as much surface. One must, therefore, have very small silos, or quite large herds, in order to prevent waste from decay. We are of the opinion that the better plan would be to make hay of the oats and peas and feed this in connection with the corn silage.

Silage from oats and peas contains about 25% more digestible protein than does corn silage, but less carbohydrates and fat.

BUTTER IS TOO HARD.

I am making butter that appears to me (and customers) all that could be desired, excepting one thing. It is so hard that it cannot be spread even after standing all day in a room at 70° F. temperature. It is more like tallow in texture. H.

Peekskill, N. Y.

We suspect the trouble is largely, if not altogether, with the feed. Corn and cotton seed meal have a tendency towards producing the condition stated. We have a dim sort of a recollection, too, of having suggested a ration formula for this inquirer, and it may be that our advice has led him onto this shoal. If he has silage or roots, it would seem as though either ought to obviate this trouble. If not, he must try some of the glutens or linseed oil meal. There is, of course, great difference in cows in this respect, but, as a rule, the tendency to over hard butter can be obviated by proper feeding.

DAIRY FEEDING IN OKLAHOMA.

I write to you to try and find out something about feed for milk cows. We (or most of us) have had no experience in getting much out of our milk. We cannot raise tame grass here. Would like to know what you think of sowed kafir corn and sowed cane and millet, for feed for milch cows? Some say to cook corn and such feed and to make mush. We are milking six cows and take the milk to our creamery.

Stillwater, Okl. T. F. P.

Try alfalfa and cow peas. There is no reason why both of these crops should not do well in Oklahoma, unless it is by the absence of nitrifying bacteria in the soil. If they are absent, send to Kansas for a few hundred pounds of soil from a vigorous alfalfa field and scatter this on four or five acres of Oklahoma land. Alfalfa hay and ground kafir corn have been found to make an excellent ration for Kansas cows (as appears from a recent bulletin), thus confirming the opinion given in these columns two or three years ago.

Kafir corn or sorghum sowed broadcast, and cut and cured as hay, and early cut millet, make very good roughage for cows, but they require bran and cotton seed meal to be fed in connection, in order to get good results.

SPELZ.

I send you under separate cover, a package of what is called, by a German friend, "spelz". He is feeding a ration of 6 pounds ground spelz and 3 pounds bran, and claims it is just the thing. This grain yields some 45 to 50 bushels per acre—liable to lodge on rich land—and in order to thresh and hull well, should stand until very ripe. Sample sent was cut too green, and is shrunken.

Would like a report regarding it. Is it rich in protein, or other facts you may know. A. P. MCKINSTRY.

Minn.

We are unable to find any analysis of "spelz". Some of the cyclopedias and the Century Dictionary mention and describe it at length, as a sort of primitive wheat, much used for human food in ancient times. Its analysis probably would not differ very much from that of our wheat of to-day, and would contain about 10% of digestible protein.

We suggest that Mr. McKinstry get a fair

Are You Ever Depressed?

And is it not due to nervous exhaustion? Things always look so much brighter when we are in good health. How can you have courage when suffering with headache, nervous prostration and great physical weakness?

Would you not like to be rid of this depression of spirits?

How? By removing the cause. By taking

average sample of this grain, and send it to the Minnesota Experiment Station for analysis.

RATION FOR A 60-POUND CALIFORNIA COW.

Please formulate a ration for me for a Holstein-Friesian cow giving seven gallons of milk. I am to feed for good milk, (rich in cream). Alfalfa hay $18 per ton; corn meal $23; heavy bran $23.

Such are prices, today, in this glorious land of sunshine. There can be no doubt about the sunshine part of it. It has been nothing else for two years now. We are deprived of rain. Out of about 150 retail dairymen, one year ago, there are still about half of us left. What will another year do with us? S. P.

Los Angeles, Cal.

Seven gallons of milk will weigh just about 60 pounds, and the cow that yields that much daily, must have generous feed. The formula we suggest below will cost nearly 28 cents per day, but this is only at the rate of 4 cents per gallon, or one cent per quart, and will leave a handsome margin for profit:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
20 lbs. alfalfa hay....	18.32	2.20	7.92	.24
4 lbs. bran.....	3.52	.50	1.54	.12
4 lbs. corn.....	3.56	.32	2.67	.17
Totals.....	25.40	3.02	12.13	.53

If experience proves that this does not suffice to maintain a maximum flow, increase the allowance of corn. Add a little salt to every feed, both as an appetizer and an aid to digestion.

The feed has so little permanent effect upon the *quality* of the milk, that this item is not any more taken into account. Feed for *quantity* and quality will take care of itself. We know there is a popular belief to the contrary, but the incontrovertible facts of hundreds of carefully conducted experiments fail to substantiate this belief. Any sudden change of feed is liable to vary the the per cent of fat for a short time, but as soon as the cow becomes well accustomed to the change, the milk returns to its normal qualities—unless, indeed, the cow is kept in a condition of high fever.

HERE'S A PROBLEM!

I am a Short-horn dairyman, breeding pure bred Short-horns for stock purposes with some grade cows yet on hand. The pure bred calves, either sex, sell readily at six to eight months old at from $75 to $125, and the grades at one year old, at from $28 to $35 for steers. I am marketing from 125 to 150 pounds of butter per week in a town fifteen miles distant, at a very good price, about half at twenty cents and balance at twenty-five cents on yearly contracts to hotel and private families. I am not able to supply the demand for this butter and want more cows.

Now I am a young man of only ten years of experience in breeding and don't think it best to divide interests too much, but it seems that here is a profitable division or rather combination of beef and butter.

Now for the problem. I could just as well keep twenty more cows, as I have the feed and the help, but what shall I buy, grade Short-horns or Jerseys? Pure breds of either breed seem too high priced for me to buy just at present. What is your advice?

Iowa. F.

With the prices for calves mentioned above, it seems to us that one might well devote himself exclusively to raising those pure bred Short-horns, even though the dams may be high priced.

Of course it is uncertain how long these prices will continue and it may be wise to cast an anchor to windward so that when beef declines and dairy products increase in price, one may not be left on the sand by the receding tide. To that end, if we were going into the dairy business at all, we we would get and breed and keep dairy cows.

Study the report we print this week of the Storrs College herd, and note that at least two of the cows did not produce butter enough to pay for the feed they consumed, whereas others made profits up to $42.82. If one gets a cow that will produce a grade steer worth from $28 to $35, when twelve months old, he will be pretty sure to have an animal that will not otherwise pay for her feed, and the total profit will be the value of the calf at birth and the small amount she may contribute to its growth.

EFFECT OF FEED UPON NEXT PERIOD OF LACTATION.

I have a considerable number of grade cows, some of them I think very good, and some I intend to sell in the spring. All are served to come in from November to January. Now at present price of butter and with liberal flow of milk, the feed I buy for them costs more than I get for the butter. When price goes down and flow of milk lessens, of course there will be a worse showing. This leads up to a question: Will the good cows I keep be any worse for milk when they freshen again if I stop the concentrated grain foods until that time or near the time and devote the labor of my men to the crops?

Peekskill, N.Y. J. H.

Good cows never require more feed than they can pay for, except when dry, unless prices go much lower than we have any reason to expect. When a cow fails to turn her surplus feed, (by which we mean whatever she receives above that required for her bodily maintenance) into other than the milk channel, it is time to cut down on the grain part of the ration. If given plenty of coarse feed when not giving milk, or when giving only a small quantity, they will do very well without any grain until after freshening. In other words, the condition of the individual cow must determine the character and amount of her feed. A cow should not be permitted to become too poor or too fat.

Education Leads to Profit and Content.

Teachableness as a Factor in Profitable Dairying.—A Young Kansan's Views.

ED. HOARD'S DAIRYMAN:—Enclosed please find one dollar to cover subscription for another year.

I was born and raised on a farm (a dual-purpose farm at that,) and I became so thoroughly disgusted with farming that, at the age of sixteen I learned to be a telegraph operator, and decided to make that my life work. After working at that several years, I came to the conclusion that there were other methods of farming, besides the way I had been taught, so I left the railroad and came back to the farm, got married and started in with one cow. Have been farming three years, and now have fifteen cows, besides some calves. My herd is a mixed herd, but the best I could get in a beef country. I intend getting a pure bred dairy bull and grade up.

I have been a subscriber for one year and can truly say, that I have learned many things from your paper.

I think I have received more benefit from that one dollar than any other dollar I ever invested. It has taught me to increase my herd, to weed out poor cows, and replace with good ones, to utilize my skim milk, to feed a balanced ration, to raise crops that will produce a balanced ration, to re-build my barns and sheds, to know a dairy cow at sight, how to raise a dairy cow. In fact, your paper has awakened an interest for the dairy business in me, to such an extent, that I have invested in a quarter section of land and a Baby No. 2 De Laval separator. It is my intention to make a model, up-to-date dairy farm here right in the midst of a hundred and one beef farmers, and show some of the old fogies that it does "pay."

I have become so interested in my work, I am as happy as a school boy coasting on the hillside, where a few years ago I looked on farming, as do a great many now, as a dog's life with nothing but hard work from dawn till dark, year in and year out, struggling with might and main for a mere existence, and almost wishing death would come to put me out of misery. No wonder the boys leave the old farm. Education is needed more there, at the present, than anywhere else.

We have one of the most prosperous creameries in our town, of any in the state, having two skimming stations and running two separators in the creamery proper, but I cannot say that all the patrons are prosperous. I fear that if an investigation were made, it would reveal a state of affairs similar to that at Meriden, Kansas, yet you cannot get one person to subscribe for a good dairy paper. "Oh no, expenses too high already." No use to tell such men that they can just as well have $80 from a cow, in a year, as $8. They won't believe "it can be done." They want to "raise calves."

One thing I have noticed in particular, of late, and that is, that scarcely a day goes by without some creamery patron, probably twice my age (for I am several years on the sunnyside of thirty yet) comes to me with questions bearing on the dairy business. In fact, I have become local authority on the dairy business, nearly all of which I have learned from "HOARD'S DAIRYMAN."

But Mr. Editor, if this is not too long now, I want to ask one question, and then I'm through. Why do some dairymen milk heifers with first calf longer than they do old cows. M. L. DICKSON.

Edgerton, Kan.

The first period of lactation is lengthened in order to help establish the habit in the heifers of holding out in milk. If the heifer's first milking period is limited to eight or nine months, she will be liable ever after to "go dry" at about that time.

How Long Should a Good Bull be Kept?

ED. HOARD'S DAIRYMAN:—To what extent, or how long is it advisable to use a sire of one distinct strain at the head of a dairy herd; for instance, the sons of great sires, as Exile and others of fame? Would it be better to branch off on a distinct family every four or five years? Why would not wide diversions tend toward better constitutions? D. H. W.

Kummoor, Pa.

The famous Jersey bull, Ike Felch, was kept until he was thirteen years old. The editor of this paper bought one of his last daughters, Queen Felch, when a calf five months old. She proved to be the finest cow, in many respects, we ever owned. Her descendants all partake of the wonderful potency of the old bull. We have no such horror of inbreeding as many evince. In a registered herd, we would keep a bull until he had shown in his daughters his quality or potentiality of breeding. Then if he proved what we wanted, we would breed him to all of his daughters that showed strength of constitution. When his granddaughters came to breeding age, we would select a sire for them of the same family as their father, but removed a generation or two, thus keeping our breeding in line. We would still retain the original bull as long as he proved useful, breeding him to his daughters as before stated, but not to his granddaughters. The final effect of such a policy is to intensify and increase in the females the power and potency of the blood of the sire. Then when it comes to unite with that of another bull in the same line, we have, as a rule, a stronger answer in dairy quality, and no loss in dairy constitution and power.

In a business herd of natives, with a registered sire at the head, we would by all means pursue the same plan. In this way we greatly increase the percentage of heifer calves that make good, profitable cows.

A three-fourths in-bred heifer, carrying in her a double portion of the blood of her sire, will respond in type and form and performance, when bred to a sire of the same breed, nearly as close as a registered heifer.

We should understand that in dairy qualities, as in speed qualities in race horses, there is a constant need of concentration. The natural trend is variation and diffusion. This we must guard against.

One thing is absolutely essential, use no sire in the way we have indicated that has not proved himself the getter of cows of high dairy power.

DAIRY FOR SALE.

On account of failing health, the undersigned offers for sale, at a bargain,

- - MEADOW FARM DAIRY, - -

Located within one mile of the post-office, city of Stevens Point, Wis., containing 300 acres of land; 200 acres under cultivation, balance first-class farming land and pasture. This dairy is well established, having been in full operation for over twenty years; 35 cows are now milked, from which $9 00 worth of milk is sold daily. The number of cows and the receipts from the sale of milk and cream can be easily doubled. Every quart of milk and cream produced is sold right at the door; the milk at three cents and the cream at fifteen cents; all sold to one man. This farm is under a high state of cultivation; 20 acres is now seeded to clover, and 40 acres to timothy. The buildings are all in good condition, having been built since 1892. A new silo was built during the past season. This entire property, including the necessary machinery for carrying on the place, 5 horses, 6 head of young stock, full blooded Jersey bull, wagons, tools, etc, is offered for sale on reasonable terms. The best of reasons for selling. Here is a great opening for the right man. Address
GEO. E. OSTER, Stevens Point, Wis.

WATCH AND CHAIN FOR ONE DAY'S WORK.

Boys and Girls can get a Nickel-Plated Watch also a Chain and Charm for selling 11-2 dozen Packages of Bluine at 10 cents each. Send your full address by return mail and we will forward the Bluine post-paid, and a large Premium List. No money required.
BLUINE CO. Box 358 Concord Junction, Mass.

A Question of the Cost of Production.

ED. HOARD'S DAIRYMAN:—The selling price for our products is controlled by the great world's market—the amount of goods produced, and the number of consumers of that line of goods, largely determining the selling price of that line of products. Prof. Bailey says: "The world's products bring the world's price. The special market fruit grower generally works on a small base. The world's market fruit grower works on a large base." The same holds true of all producers of standard products.

The cost of production is the only factor that lies largely in our control. It is all very nice and plausible to say, there is always room at the top; but it goes without saying, that we cannot all be president, or that the privates cannot all be major-generals. No, it is the great rank and file that need consideration and help.

We are often told if we produce the finest goods, we can get the cream of the trade, and make our own prices, but here is where the base is very limited—the cream of the trade is very limited. The great, great majority of farmers must furnish food products for that great world's army, the laboring people, the workers in the factories, mines, transportation lines, etc., etc.

A few, select few, may have the opportunity to sell to the millionaires, but he cuts no figure in the making of ruling prices, and we must learn to produce our line of products, be it milk or butter, grain, fruit or vegetables, at such a price as the ordinary laborer, the great body of consumers, can afford to pay. We must remember that the labor market is over supplied, and, as a consequence, wages are low, and the laborer cannot afford to pay us the prices he could some years ago, when wages were 50% higher.

Dollar wheat would be a great blessing to us, but it certainly would be the reverse to the great army of laborers of the country. We, of course, all desire better markets and better prices, but under present conditions it will be wisest for us to try to adjust ouselves to the existing conditions, try to produce milk, butter, eggs, grains, meats, etc., at such a price as the men who dig our coal and iron ore, and manufacture our implements, and print our books and papers, can afford to pay.

I do not advocate that we should debase ourselves or make slaves of ourselves, but that we should become masters of our vocation. We must call to our aid modern scientific discoveries, along our various lines of work.

The scientific findings along the line of stock feeding, the same doctrine that HOARD'S DAIRYMAN has been preaching so eloquently week in and week out for years, if carefully studied, and the knowledge intelligently applied, will enable us to reduce the cost of producing our milk, butter and beef, that we can sell at ruling market prices, and still have a fair profit.

If we study the soil, plants and plant food, we will learn that we are very wasteful of our resources, though unintentionally, very often. Often we purchase fertilizer that is not needed, and again omit what is needed; our land may have fertility enough, but not be in the right mechanical or physical condition. There may be plenty of mineral plant food, but the soil be lacking humus and nitrogen, but happily, during the last score of years, discoveries have been made by which we, whenever we so desire, can draw on the nitrogen of the atmosphere, and store it in the soil for the use of future crops, by the use of leguminous crops, as clover, peas, etc.

This knowledge and these discoveries all help us to produce crops cheaper, so as to meet the exigences of the times. It behooves us to diligently study along these lines, not only for our own sake, but for humanity's sake as well. L. W. LIGHTY.

Adams Co., Pa.

Dual Purpose Cows.

ED. HOARD'S DAIRYMAN:—At the risk of being called the "son of the devil" by Prof. Shaw, I will undertake to once more attack his dual-purpose theories, as embodied in his paper No. II, in second issue of Feb. 24th, last. Inferior milk and inferior beef animals can never be satisfactory to a progressive man, and a dual-purpose animal can never be any other, as is so thoroughly proven in that article.

To a breeder selecting animals everlastingly to be beaten in the show yard, and never to make a record over the pail, a dismal prospect opens up, and very few will face the music—knowingly. I reiterate my former contention, which I have since learned is very successfully practiced in Scotland, viz: Breed all cows, not required to keep up the strength of the dairy herd, to the best block of a beef bull obtainable, and in nine times out of ten you will score many points against the little beef and little milk producer.

In talking of averages of production, the professor possibly speaks of those in the college herd; but he knows that outside of that the tale is a different one; and he knows, moreover, that the general-purpose cow breeders, i e, the more ignorant and strongly prejudiced of the farming fraternity, seldom attain the figures he mentions for an average, with their herds. They are the men who judge a beef sire by the shape of his horns, and praise the cow that gives three parts of a pail (! !) night and morning, and judge of her butter fat by the color of her ear. But listen! The love so charmingly expressed for the dual-purpose is really a fear of the intelligent dairy farmer and his "Calamity Jane" with the screw end of the hogshead of butter.

See the dreadful prospect: A June morning, and the earth white as winter, but not with snow. What then? Ah, it is milk from that entering wedge shape, screw-ended, never letting up night mare of a single-purpose cow, flooding the entire country. But, to be serious, could a man write more foolishly than to say, that it would be a dire calamity to humanity, if milk were as plentiful as it should be? Look around, Mr. Editor; go into the dwellings of the average workman today and see whether there is any danger of a milk deluge. Have the children of our poor—the poor themselves—no consideration in the eyes of this champion of the go between? I dare to say that if every citizen of the United States had all the milk and dairy produce required for his or her well being, every cow, in all this vast country, put to her best, could not begin to supply the demand.

Politics engage our attention now, but as soon as we turn our eyes and mind from them, and apply ourselves only to the fruitful consideration of economics and ethics, we shall not only deal death blows to the profit mongers who now sell soap grease and glucose for butter, but we shall learn to see that the value of milk as a food, lies not so much in its ether extract, as in its well balanced entirety. From the milk itself, pure foods, such as Gruyére cheese and soft curd cheese will be made, and our brothers and sisters of low degree will eat with their brothers and sisters of high degree, neither low priced abominations nor high priced trash; but a food that will build up a well balanced physique fit to encompass a well balanced mind. That day is coming rapidly, and when dairymen will ultimately possess, i e., legitimately and systematically make use of the arable farms of this country, then rosy cheeks and bright smiles will cheer us on every hand, and the drones of our highways, without means of subsistence, and those in our palaces with a surplus of them, will no longer be a menace to public safety and prosperity.

That such a diet will cure all indigestion and dyspepsia, follows as a matter of course, and dreams of grandad's cows in the past, and deluges of milk in the future, will not trouble the leisure moments of either professors or students, but healthful labor and truthful views on all questions will unite all in the brotherhood so long and oft foretold so speedily to eventuate, and yet so inpracticable while the selfish interests of one set of men are in diametrical opposition to those of others. DANIEL F. BOISSEVAIN.

37 Packets fresh garden seeds and knife No. 7sb, all for 77cts. postpaid or 37 packages fresh garden seeds and knife No 77sb, all for 97 cts postpaid. Cut out this advertisement and send us 77cts. if you want knife No. 7sb, or 97cts. if you want knife No. 77sb, and the following grand collection of THE BEST VEGETABLE SEEDS, (retail price is over $1.75) and we will send the entire 37 packets and the knife FREE, all postpaid.

No. 7 SB. 1 pkg. Gem Peas, 1 pkg. Eclipse Blood Turnip Beet, 1 pkg, Dwarf Wax Beans, 2 pkgs, Early June Peas, 1 pkg String Beans, 1 pkg, Yellow Danvers flat Onion, 1 pkg. Kobbs Gem Watermelon, 1 pkg. Ox Heart Carrots, 1 pkg. Large Early York Cabbage, 1 pkg. Marble Mammoth Drumhead Cabbage, 1 pkg. Long Green Cucumber, 1 pkg. Danvers half long Carrots; 1 pkg. Green Citron Muskmelon, 1 No. 77SB. pkg. Perfection Tomato, 1 pkg. Trophy Tomato, 1 pkg. Rutabaga, 1 pkg. Big Boston Lettuce, 2 pkgs Purple Top Turnip, 1 pkg. Hollow Crown Parsnips, 1 pkg. long Scarlet Radish, 1 pks. Double Curled Parsley, 1 pkg, Celery, 1 pkg. Thyme, 1 pkg. French Breakfast Radish, 1 pkg. Summer Crookneck Squash, 1 pkg. Curled Simpson Lettuce, 1 pkg Eearly flat Dutch Turnip, 1 pkg. Scarlet Turnip Radish, 1 pkg. Denver Market Lettuce, 1 pkg. Early Russian Cucumbers, 1 pkg. Cutham King Cabbage, 1 pkg. Sweet Pumpkin, 2 pkg Early Minnesota Corn, 1 pkg Red Globe Onion

KNIFE FREE.

At 77 cents the No. 7sb, 4-blade Congress buck horn handle, best steel warranted knife will be sent FREE.

The No. 77sb, knife is just what every farmer should have. Extra weight, finely polished ends, three heavy steel blades, including hoof blade. We give it FREE to every person ordering the above collection at 97cts. through this advertisement, or we will furnish the 37 fresh packets of garden seeds to anyone postpaid for 97cts—no better seeds grown or sold at any price. This collectioncannot be broken or any variation made.

SPECIAL In order to test this paper as an advertising medium, to everyone who will enclose this advertisement with their order, we will send

20 PACKAGES VALUE $1 00 FREE!

making 57 packages of fresh garden seeds and the knife No. 7sb for 77 cents or knife No. 77sb and 57 packages for 97 cents. A remarkable offer.

T. M. Roberts' Supply House, Minneapolis, Minn.

Pure Bred **Tamworth Pigs,** Bacon curers choice. Pure Bred **Ayrshire Cattle,** largest imported herd in America. Stock all ages for sale. R. G. STEACY, Box 720 Brockville, Ont., Canada.

FOR SALE.

One of the best

CREAMERY PLANTS

In the Northwest. For full particulars address, **A. L. BRYANT,** Box 48, **Anoka, Minn.**

FOR SALE!

The farm of the late Oscar Hasbrouck, situated in Ulster Co., N. Y, on the Poughkeepsie Bridge R. R., 10 miles west of Poughkeepsie, containing 300 acres, 60 acres of which is heavy timber. It is well supplied with small spring brooks running through it, and has a fine wind mill for bringing water to the barns and house. The buildings cost over $20,000, and are all in fine condition. Fine modern house heated with hot air. This farm is under a high state of cultivation Wood lot alone is worth $5,000. This property is within one-half mile of depot, church, school and village. This farm is equipped with all farm machinery, tools, stock, etc. Must be sold to settle up the estate. For a gentleman's country seat and stock farm, this place has no superior. Possession giv n at once. For Price and particulars address one of the executors. **IRA H. HASBROUCK,**
Drawer 987, Kingston, N. Y.

ENSILAGE COMBINATION

A complete balanced feed for milch cows, without the addition of grain or other purchased feed. Composed of Corn and Early Soja-Beans; the latter (*the richest vegetable substance known*) supplies the protein and fat in which the corn is deficient. **Will save four-fifths of the feed bill.** No large dairy can be profitably operated without a silo, and every silo should be filled with two parts Corn to one part Early Soja-Beans. Details cannot be given here, but full particulars in Henderson's American Farmers' Manual, free on application to those who state where they saw this advertisement.

35 & 37 Cortlandt St., NEW YORK.

A Criticism.

Estimating Returns From a Dairy Herd.

ED. HOARD'S DAIRYMAN:—I have read with much interest your comments on "Low, Unprofitable Standards," in your last week's issue. The claim is there made that a man with "dairy" sense, on a 160 acre farm, can keep 30 cows in milk the year through, and that from those thirty cows he can have an income of $1,277.50 a year, counting the by-products at $400.

This claim I shall not dispute; it is fair, but presents only one side of the ledger. What I wish to show is that there is another side to the account, and with your permission, Mr. Editor, will here present both sides:

	Dr.	Cr.
By admitted credits from products and by-products.....		$1,277.50
To feed consumed at 10c per cow per day.....	$1,095.00	
To interest on capital invested in cows.....	60.00	
To labor of one man in feeding and milking.....	250.00	
	$1,405.00	

We charge only labor for one man, although you will readily admit that there would be work enough for two. In charging for feed, we hope you will allow us to use one of your many balanced rations, which you will concede to be absolutely necessary if we shall succeed in making the 30 cows give milk all the year through, and I think you will admit that even one of the cheapest rations will cost at least ten cents per day.

I have not charged anything for taxes, insurance, or accidental losses of a cow or two or a half a dozen calves, or for boarding the one man who is doing all this work for a little over $20 a month, because the sum was already too large to contemplate with satisfaction from the point of view of the farmer.

It may be that "lack of dairy intelligence produces just such results," but under the circumstances I should rather say that, "ignorance is bliss," especially as long as "intelligent" people are telling us that there is no remedy except in cheaper production.

"Intelligence" may be able to create a new species of cows, which will produce 50 cents worth of butter out of a ten cent ration, and whose capacity can be increased at will, like a threshing machine, but in the meantime we must be satisfied with the cow that God constructed.

I have been an almost constant reader of the DAIRYMAN for 6 or 7 years and will frankly admit that the theories advocated therein, at first struck me as very practical, and acting upon its ideas I went and bought a bull from one of the acknowledged dairy breeds, and to-day I have, I think, thirty females of all ages from that bull; some of them have already had 2 or 3 calves, and are old enough to show their capacities, but I regret to say that out of the whole lot I do not believe I will have one cow which will be capable of producing butter at a profit, at the prevailing conditions of the butter market for the last three years. If our patrons were going to kill off all the unprofitable cows, I am afraid that there would be no cows left. Any intelligent editor, even if he never handled a cow, ought to know that there is a limit to the natural capacity of all living things, including the cow. If you go beyond those limits an unnatural condition will begin to exist and will sooner or later assert itself through disease or degeneration.

C. AHLNESS.

Minn.

If Mr. Ahlness will refer again to the article he criticises, he will find it is not our writing, but a clipping from a Nebraska paper.

DAIRY MARKETS.

ELGIN, March 20 - Butter market active at 20c One thousand pounds sold at 20c, 800 pounds at 20½c, and 2,000 pounds at 21c.

CHICAGO Ill., Mch. 20—Butter—Creamery, extra, 19½@20c; firsts, creameries, 17@18c; seconds, 14@15c; dairies, selections, 17c; No. 1, 15@16c: No. 2, 12@12½c; extra ladles, 14c

Eggs—Fresh, at mark, cases included, sold at 12¼@12½c;

Cheese—Full cream, Twins, good to choice, 11½c; Cheddars, 10¾@11¼c; Young Americas, 12c; Swiss 10@13c; Limburger, 7@11c; Bricks, 9@12½c.

Cattle—Receipts were heavy, but the demand was very good and prices were generally steady. Some early sales showed a slight decline, while late transactions in some instances showed a little advance, compared with the close of last week. Exporters bought freely at $5 20@5.65. A load of 1,543-lb. straight Texas from the late Fort Worth fat-stock show sold at $6 and 6 loads at $5 30@5.50. The $6 cattle belonged to M. Lansom & Co and the $5.50 to A. Silberstein & Co. Native steers, averaging 843@1,630 lbs, sold at $4@5 75, bulk, $4.80@5 59; fed Westerns, $4 40@5.50; Missouri Texas, $4 20@4.90; native butcher stock, $2.25@4.85; calves, $4.50@6.75, and feeding cattle, $3.40@4.70.

To-day's receipts are estimated at 2,500 cattle, 23,000 hogs, and 17,000 sheep.

Bran—Firmer, with a sale of 1 car at $13 per ton.

MILWAUKEE Wis., March 20—Butter—Fancy Prints, per lb., 19½@20c; extras per lb, 19@20c; firsts, 18@19c; seconds, 16@17c: Imitations, 15@16c. Dairy—Selections, per lb, 15@17c. Roll Fair to choice, fresh, 11@13½c. Market strong under moderate arrivals which are quickly absorbed by the trade.

Cheese—American Full Cream—October Twins 11@12c; Brick, October, choice, 11@11½c; Winter made, 10½@11c; Limburger, Fall, choice, 9½@10c; Winter made, 9c. Swiss, Drum, choice, 12½@13c· Block, choice, 10@10½c

Eggs—Fresh, per doz, 12c.

NEW YORK, Mch. 20—Butter—Receipts 2,173 pkgs. steady; Western creamery 15@21c; Elgins, 21c; factory, 12¼@15c.

Cheese—Receipts, 2,877 pkgs; firm; large white 12c; small, 12½c; large colored, 12c; small colored 12½@12¾c.

Eggs—Receipts 11,747 pkgs; steady; Western 13c; Southern 12½c.

BOSTON, March 20 - Butter—Creamery, extra, 21c; western, extra 20½@21c; dairy, extra, 17@17½c; imitation creamery, 15@16c; western ladle, 14@14½c; print creamery, 21½@22c; box creamery, 21½c.

Eggs Fancy, near by, 15c; choice fresh, 14@14½c; Michigan extra, 14c; western, 13½c; fair to good, 10@10½c.

BALTIMORE, Md., March 20—Butter—Steady; fancy creamery, 21@22c.

Eggs—Firm; 12c.

Cheese—Firm, active.

ST. LOUIS, Mo, March 20—Butter—Steady; creamery, 17@22c; dairy 13@17c.

Eggs—Steady; 10¼c.

KANSAS CITY, Mo., March 20—Butter—Firm; creamery, 14@19c, dairy, 15c.

Eggs—Few carried over from last week and to-day's receipts moderate. Feeling firm, prices unhanged Hravier supplies are expected this week. Fresh Missouri and Kansas stock, in new cases, cases included, 11c; cases returned, 10½c.

NEW YORK MARKET.

NEW YORK, March 18 Butter—Receipts for the week, 32,717 packages. Exports for the week, 2,756 packages.

The phenomena of consolidation and co-operation and combination is no where more apparent or more interesting than is shown in the handling of Dairy products; to such an extent has this gone and to such proportions has it reached that the private dairy has become almost obsolete—even the Hon. Levi P. Morton, long looked up to as perhaps the leading development of high class private dairying, has withdrawn, and the dairymen of the state desire to say Good by to Mr. Morton with their hearty, best wishes for his future. On the other hand, the combination of milk in large dairy plants is accelerated and extended until the resultant effect upon this market here is getting to be an absence of private dairy receipts, and scarcely enough of private dairy butter is here to warrant quotations. Exporters have been buying a little fresh imitation creamery butter at 16@17c, some fine ladles at 14@15c. Fancy fresh creamery makes were cleared at 20c, and at the close is marked up to 21c. There is very little doing in early make butter and very little stock to do with, and the remnant is being peddled at from 13 to 16c, the price dwindling as the visible supply vanishes. We quote:

Creameries, extra, 21c; medium, 19@20c; poor, 15@17c; Dairies, extra, 20c, medium, 17@18c; poor, 13@16c.

Cheese—Receipts for the week, 15,956 boxes. Exports for the week 1,880 boxes. Not so much life to the market past week, but prices are unchanged and holders are indifferent, feeling that there is not more than enough stock to carry us into the new makes. We note sales of fancy small cheese to local trade at 12½@13c, large sizes, mostly white cheese, to out-of-town buyers at 11¾@12c, and one considerable line of summer make colored cheese changed hands on private terms. Winter make cheese selling from 1c@11c. We quote:

Full cream, small, extra, 12½@13c, medium, 11@12c, poor 8@10c; full cream, large, extra, 11¾@12c, medium, 11@11½c, poor, 8@10c; part skimmed, extra, 10@10½c, medium, 8@9c, poor, 6@7c.

Eggs—Receipts for the week, 92,092 cases. Plenty of eggs this week for every one; business was large and notwithstanding the immense receipts, prices dropped only one cent dozen on the week's business, and at the close free trading is going on at 13c for best marks eggs. We quote:

New York and Pennsylvania eggs 13@13½c per dozen; Western, northern Sec., 13c per dozen.

DAVID W. LEWIS & CO.

177, 179 Chambers St.

BALTIMORE MARKET.

BALTIMORE, MD., March 16—Butter—The absence of new features of general interest in this line of business seems, this week, to be the principal distinguishing fact, making it different from other like periods at this time of the year The receipts of separator creamery, as regards quantity, are about equal to the expectations, and they, in turn, measure up to the requirements, but they fall short of the flavor that buyers think they have grounds for exacting at this time, consequently, even the best grades are unsatisfactory and below extra firsts, or around about an 80 point quality, selling comes hard, but has to take place, because accumulations are the fear of the receivers now, when what is tolerable of the new make of to-day, would be intolerable of the figurative to-morrow. Shipments from the Elgin district are no exception to the general receipts, and we find the favorite marks sharing the condign criticisms with their less favored competitors. In the descending scale the next variety of butter is the gathered cream products, and about the receipts of them it can be said truthfully that they are very light, and because of that fact the grading is more liberal; demand for the best marks is largely in excess of the supply, and helps to dispose of some of the faulty lots at better figures than otherwise would be possible. Imitation creamery and ladles also are very scarce; demand active for the high grades. Very little doing in June creamery beyond sending out samples. In prints and blocks there is an increase of receipts, and a corresponding improvement in amount of business done in them Rolls are in very light receipt and generally sold on arrival.

Creamery separator, extras, per pound, 22; 1sts, 20@21; seconds, 18@19; gathered cream, extras, 19; firsts, 18; seconds, 17; Ohio, 20@21; firsts, 9@20; seconds, 17@18; imitation, extras 17@18; firsts, 14@15; seconds, 13. Iowa & N. W. ladle, extras, 15@16; firsts, 13@14; seconds, 12. Ohio and Indiana ladle, extras, 15; firsts, 14; seconds, 13. Roll, extra, 14; firsts, 13; seconds, 12. W. Va. Roll, extras, 13@14; firsts, 12; seconds, 11 Creamery Blocks, (2 lbs.) extras, 23@24; firsts, 21@22; seconds, 19@20; prints, (½ lb.) extras, 23@24; firsts, 20@21; seconds, 18@20. Md., Va & Penna. prints, extras, 20; firsts, 18; seconds, 15@16.

Eggs—Eggs have been in quite liberal receipt. So far this week, all lots arriving have met with prompt sale. The trade generally think that the price is low enough for the season, consequently there has been no accumulation of stock, as the demand has been fully equal to the supply. Our market is quite active at 12c. Duck eggs are coming in more freely, and owing to the low price of hen eggs, there is an easier feeling in duck eggs; all invoices of large clean stock meet with quick sale; small or dirty eggs are slighted.

301 Exchange Place. G. M LAMB & BRO.

FOREIGN MARKETS.

Cable advices of this date from the principal markets of Great Britain to Geo. A. Cochrane give butter markets as quiet and in buyers' favor, who are buying for immediate wants only. The receipts of Australian and New Zealand continue liberal and with considerable stocks the outlook is uncertain. The weather is fairly seasonable but unless receipts fall off markets must decline. American creamery a dull sale, quality is not good enough to be attractive and is offered at 17@19c. Finest imitations sell fairly well at 16@17c. Ladles are less active and are dragging sale above 15c. Buyers ideas are 14c. generally. Finest Australian offering at 20@20½c. Grades just under finest are pressed for sale at irregular prices, which greatly interferes with American goods. Very little Canadian arriving and finest creameries are selling at 21@22c in boxes.

Cheese markets are in better shape. Arrivals are falling off, especially from New Zealand, which makes importers firmer in their ideas. The demand for grades under finest has been so great stocks of such are nearly exhausted and more attention is given to fall made, which is selling at 11@11½c with most holders asking more money A favorable wind up on the season is looked for.

READING NOTICES.

All Reading Notices under this head are at the rate of 25 cents per line.

Position Wanted—As butter or cheese maker. Twelve years experience. Highest references. J. C. H., Box 901. Whitewater, Wis.

Position Wanted—By a first-class buttermaker. Can furnish good recommends, one term at dairy school. L. J. KRAMER, Eastman, Wis.

Buttermaker wants situation; 8 years' experience. J. E. FORWARD, Mechanicsburg, Pa. 6-2

"ALPHA-De LAVAL" CREAM SEPARATORS.

"ALPHA-De LAVAL MACHINES possess every merit to be found in any other separator made—they do everything any other separator can do.

IN ADDITION:—

They skim from one-tenth to three-tenths closer in test percentages than any other separator can under practical conditions of operation.

Their actual capacity is 25 per cent. greater than the claimed capacities of other machines of relative size and price

They use just so much less relative power by reason of their smaller size bowls and necessary speed of only 6,000 rev. per minute, against larger bowls and speed of from 8,000 to 25,000 rev. in other machines

From the same reasons their cost of repairs is just so much less and their durability so much greater.

And again from much the same reasons, their cream is the more uniform, more thoroughly and quickly churnable, and productive of superior excellence in butter.

They are alone of the improved "Alpha" disc type of construction, which protecting patents prevent the use of in any other machine, and which gives them their overwhelming advantages in many respects.

Their mechanical design and construction is the best. Their selling prices are absolutely maintained. Consideration of cost need not and does not enter into their manufacture.

"Factory" or "Dairy" catalogues upon application.

The De Laval Separator Company,

WESTERN OFFICES: Randolph & Canal Sts., CHICAGO.

GENERAL OFFICES: 74 Cortlandt Street, NEW YORK.

BRANCH OFFICES: 1102 Arch Street, PHILADELPHIA.

Wanted Position—As butter maker. Best of reference from present position. Temperate, and do my own repairs. Seven years experience. Address Lock Box 123, Beichertown, Mass.

Wanted—Position by capable butter maker. Seven years experience in separator creamery. Address L., care HOARD'S DAIRYMAN.

Guernsey Bulls—and bull calves for sale. The best blood of two Experiment Station tests. Prices from $35.00 up. WILLIAM BLACK, Box 357, Mt. Vernon, Ind. 6-2

Six large young Toms—Mammoth Bronze, 28 to 32 lbs, $5.00 each; W. Holland, 24 to 26 lbs, $4 00 each. J. H. ROE, Chano, Ill.

For Sale—At a sacrifice, for proper reasons, large successful creamery. Best markets, cheap freights by water and rail at the door; 120,000 lbs. butter 1898; fast growing milk supply; perfect butter climate; no ice needed; spring water piped; green grass year round. Address at once, R. D. SANFORD, Coquille. Oregon. 6-2

For Sale or Rent—The Portage creamery, Portage, Wis. Immediate possession. Liberal terms to good party. WILLIAM FULTON, Prop. 5-tf

Wanted—Position is wanted as manager of a stock or dairy farm, by an experienced man. Would board help. Address LOCK BOX, 724, Malone, N. Y. 5-4

Wanted—Ten Men; able to give $200 security. To canvas for memberships to the Veterinary Science Association of London. Apply in person or by letter to room 5. Sutherland block, Janesville, Wis. 5-3

For Sale—Holstein-Friesian bull calf 6 months old, from a No. 1 cow. 80 lbs. milk per day and 18 lbs. butter per week. Will sell very cheap if taken soon. Want room for others. All particulars can be had by writing to WM. HAMBLY, Belmont, Wis. 5-2

For Sale—A first-class cheese factory six miles N. W, of Appleton. Good location and everything in first-class shape. For particulars address. NICK HUSS, Appleton, Wis. 4-3

Hermanville Tamworths, Cross-heds, etc. J. A. MACDONALD, Hermanville Farm, P.E.I., Can. 32-52

An Entire Carload—Of high graded Jersey cows and heifers are in my hands for sale immediatley. F. H. MERRELL, Portage, Wis. 52 tf

For Sale—A very desirable and good paying dairy, consisting of 20 head, or more of Holstein graded cows; average milk sales of two hundred dollars per month. C. H. ELLIS, Waxahachie, Texas. 52-tf

Wanted—A married man to do general farm work. Must have good references. Write H. P. WEST, Fayetteville, Wis.

For Sale—120-acre dairy farm stocked with grade Jerseys. Will sell cheap with or without stock. H A. BOYNTON. Shiocton, Wis.

Wanted—Man and wife experienced in dairy farming. Permanent position to right parties. Good wages, new house. Address with references P O. Box 344, Keokuk, Iowa.

To Exchange—320 acres good Texas land, located 15 miles west of Beaumont, on So. Pac. Ry, and 3 miles from station. Will exchange land for Holstein cattle. Address A. R. CROUCH, Granada, Minn. 6-4

Type More Important Than Breed.

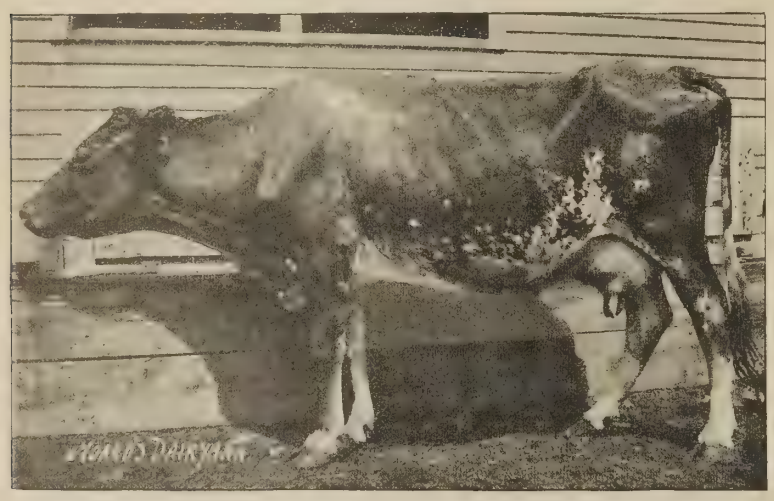
Record of Storrs College (Conn.) Herd, and Deductions Therefrom.

ED. HOARD'S DAIRYMAN:—The following tables have been compiled from the records for the past year of our college herd. This herd of 25 cows includes four registered Jerseys, three Guernseys, four Ayrshires, and the balance are mostly Jersey and Guernsey grades. The registered cows were selected for the college by committees of breeders of the respective breeds, and are presumably fair representatives of the several breeds. The grades have been selected and purchased from time to time, and perhaps are better than the average run of dairy cows.

MANAGEMENT OF THE HERD.

The feeding, milking, and care of the herd are attended to by student labor. While this system offers many advantages to the student, the unavoidable irregularity is not conducive to the largest yields from the cow. But the management of the herd is governed by the idea of using the herd for purposes of instruction. In carrying out this idea, we have kept a record of the daily milk yield of each cow, and the Babcock test for fat. Also the hay, silage and grain have been weighed out to each cow for each feed during the year. With these individual records at hand, the herd becomes of great value to the student in illustrating the types of dairy cows.

FEEDING.



In the selection of concentrated feeds, we have been guided in our purchase by the relative price of protein in each. The herd has been fed a balanced ration of a nutritive ratio of about 1 to 5. In winter, this ration consisted of from 25 to 30 pounds of silage, 8 to 10 pounds of hay, and 6 to 12 pounds of grain, the latter varying with the ability of the individual to make good use of it. In summer, with scanty pasturage, soiling crops were supplied and some grain fed.

DIVISION OF THE HERD.

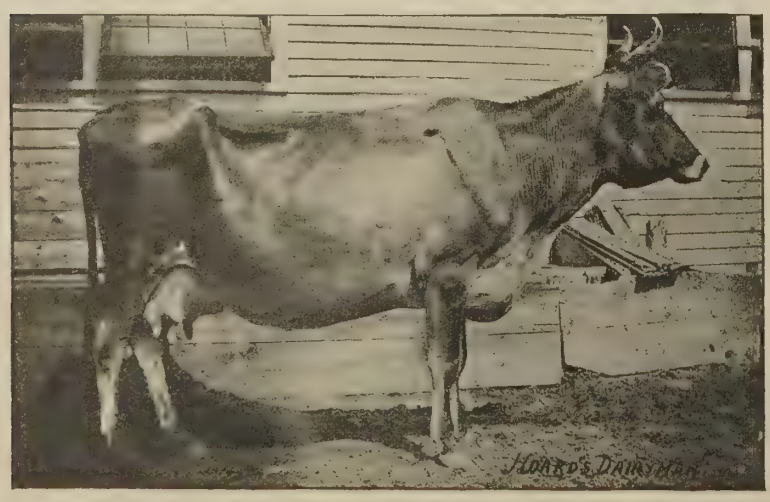
As a result of a study of the form of each individual cow, we have divided the herd into four groups or types. These divisions in the main correspond with those made by T. L. Haecker in his study of the Minnesota Experiment Station herd. While not drawn on fast lines, as will be noted by an overlapping of the divisions headed, "Net Profit," and "Cost of One Pound Butter," comparisons of the average of each group are worthy of some consideration by any student of dairy cows.

EXPLANATION OF TABLES.

In tables one, two, three and four, the first column gives the number of the cow; second, her age; third, her breeding; fourth, total cost of feed consumed; fifth, pounds of butter produced as estimated by the Babcock test; sixth, food cost of one pound of butter; seventh, net profit based on crediting each cow with butter only at eighteen cents per pound, no allowance being made for skim-milk or manure, or charge made for labor; eighth, milk produced.

COW NO. 1, STORRS COLLEGE HERD.

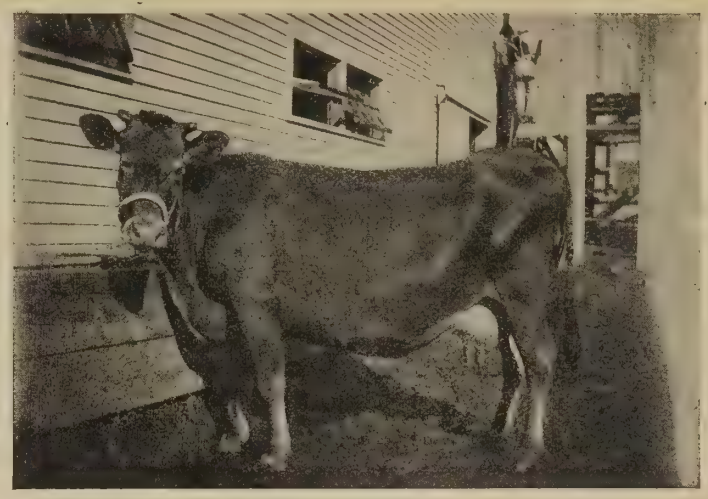
(Ideal Dairy Type.) Net Annual Profit, $40,42.



CLASS I—VERY SPARE, WITH DEEP BODIES AND WELL SPRUNG RIBS.

No. of Cow.	Age Years	Breed.	Cost of Food for One Year.	Butter 83 Per Cent Fat.	Cost of 1 Found Butter, Cents.	Net Profit.	Milk Produced.
1	9	Grade Guernsey	$44.54	472	9.44	$40.42	8,558
2	10	Jersey	48.80	509	9.58	42.82	8,465
Average			$46.67	490	9.56	$41.62	8,511

In the above class are two cows characterized as very spare, with deep bodies and well sprung ribs. They approximate in form very nearly to the ideal dairy type, and in addition to this form we find them to be persistent milkers.



In 1897, cow No. 1, after having been in milk one year, and without dropping a calf, made a record of 466 pounds of butter. Cow No. 2 will resent any attempt to dry her off. These two cows, then, are placed alone in this group, instead of at the head of Class II, on account of this quality of persistent milking.

In our study of dairy cows we are looking for outward signs that will give token of this quality.

COW NO. 2, STORRS COLLEGE HERD.

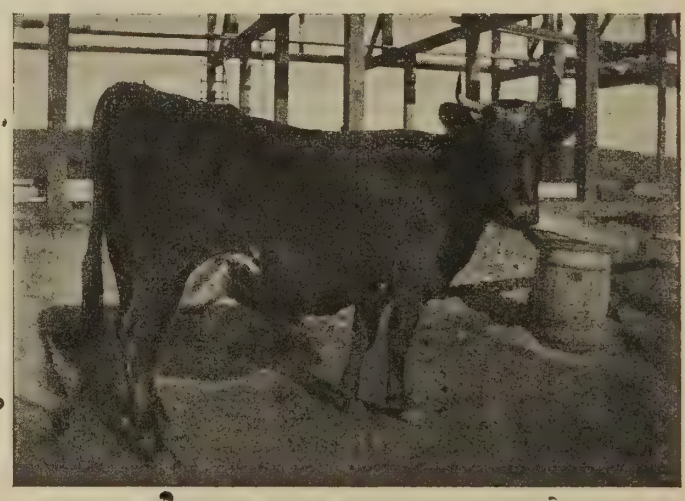
(Ideal Dairy Type.) Net Annual Profit, $42.82.

COW NO. 7, STORRS COLLEGE HERD.

(Dairy Type.) Net Annual Profit $22,11.

CLASS II—SPARE, WITH DEEP BODIES AND WELL SPRUNG RIBS.

No. of Cow.	Age Years	Breeds.	Cost of Food for One Year.	Butter 83 per Cent Fat.	Cost of 1 Pound Butter, Cents	Net Profit.	Milk Produced.
3	2	Grade Guernsey	$40.60	368	11.0	$25.64	6,024
4	6	Jersey	40.21	360	11.1	24.59	5,379
5	6	Jersey	39.18	340	11.2	23.02	5,014
6	7	Grade Holstein	36.73	313	11.7	19.61	5,730
7	13	Guernsey	42.18	357	11.8	22.11	6,435
8	2	Grade Guernsey	37.78	308	12.2	17.66	6,077
9	6	Grade Holstein	42.88	343	12.2	18.86	7,304
10	7	Grade Jersey	36.71	297	12.4	16.75	4,540
11	8	Ayrshire	47.06	375	12.5	20.44	8,249
12	7	Grade Guernsey	40.04	337	12.5	20.62	4,754
13	10	Grade Jersey	44.08	352	12.5	19.28	6,548
14	9	Grade Jersey	41.00	316	12.9	15.88	5,500
15	8	Grade Guernsey	43.13	289	14.9	8.89	5,608
16	10	Guernsey	42.68	278	15.3	7.36	4,864
Average..			$40.94	331	12.4	18 62	5,859



Fourteen cows of the herd fall into this group. They are characterized as spare, with deep bodies and well sprung ribs. As compared with Class I, they charge three cents more for each pound of butter produced, and make less than half as much net profit.

In group III we place five cows lacking digestive capacity. They might be described as "slab sided," as their ribs drop too soon after leaving the spinal column. A number of the individuals in this group have characteristics that are quite noticable. No. 18 is a quarrelsome cow, a fighter and the boss of the herd. No. 19 is a very nervous animal, and uses considerable of her energy in unnecessary worry. No. 20 is a discontented cow, and always on the alert for an open door or gate, and usually seen to be where she ought not to be. No 17 exhibits about as much intelligence as a chicken, often unable to find the barway fom the pasture at milking time.

Class IV (see opposite page) contains the cows that have a tendency to lay on flesh. Two of them were kept at an actual money loss and the average profit from the four was 55 cents. It will be noticed that two cows in this group are registered animals, one a Jersey and the other an Ayrshire.

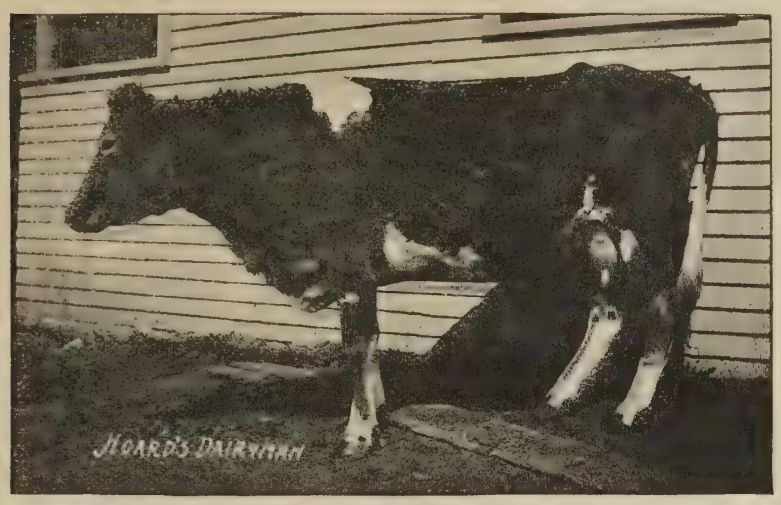
In tables V, VI and VII, we have a grouping of the average of the different types, the average of the whole herd, and the average of breeds.

It will be noticed that the grades stand next to the Jerseys in pounds of butter produced, cost of one pound of butter, and in net profit.

COW NO. 11, STORRS COLLEGE HERD.

(Dairy Type.) Net Annual Profit $20.44.

CLASS III— SPARE, BUT LACKING DEPTH AND WIDTH OF BODY.



No. of Cow.	Age Years.	Breed.	Cost of Food for one Year.	Butter 83 per Cent Fat.	Cost of 1 Pound Butter, Cents.	Net Profit.	Milk Produced.
17	6	Grade Jersey	$37.59	282	13.3	$13.17	5,083
18	7	Guernsey	41.75	292	14.3	10 81	4,828
19	7	Ayrshire	41.27	286	14.4	10.21	7,188
20	7	Guernsey	39.36	246	16.0	4.92	4,122
21	6	Ayrshire	39.22	233	16.8	2.32	5,401
Average.			$39.83	267	14.9	$8.28	5,322

In comparing breeds with types, we find the range in amount of butter produced, to be, with the Jerseys 371, Ayrshires 266, or a difference of 105 between the highest and lowest. The variation due to type is 273 pounds.

In a similar way, the range in the cost of one pound of butter, between the breeds is

CLASS IV—COWS WITH TOO MUCH FLESH.

No. of Cow.	Age, Years.	Breed.	Cost of Food One Year.	Butter 83 per Cent Fat.	Cost of 1 Pound Butter, Cents.	Net Profit.	Milk Produced.

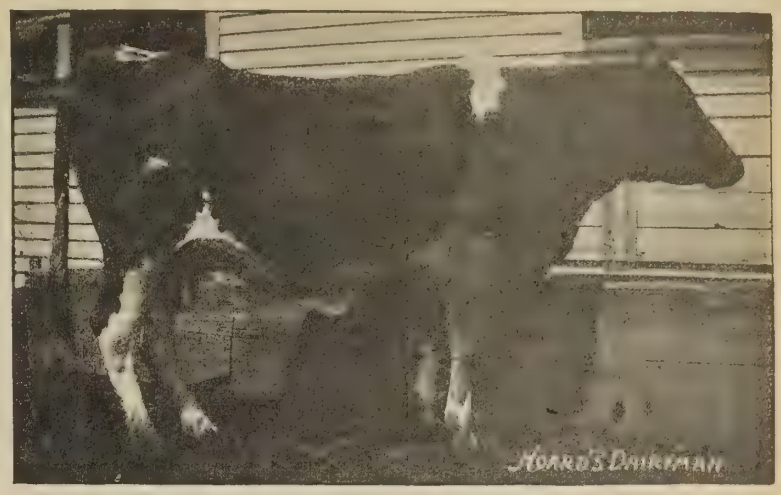
COW NO. 21, STORRS COLLEGE HERD.

(Lacking depth and width of body.) Net Annual Profit $2.32.

four cents, while the range between the types is eight and one-half cents.

The range in net profit between breeds is $16.25, while the range between types is $41.07.

We may conclude then, that the form or type, more than breed, will determine the ability of a cow to produce butter economically.



The following prices were charged for feed, per ton: Rowen $10; mixed hay $10; corn stover $6; silage $3; soiling crops $3; pasture (for the season) $3.50; bran $14; gluten $18.50; cotton seed meal $22; linseed oil meal $25. C. L. BEACH.

Storrs Agricultural College, Storrs, Conn.

From an Old Dairyman—Ripening Cream.

ED HOARD'S DAIRYMAN:—Am 66 years old in a few days; took my first lesson in milking at the age of 10 years; have been at it ever since. In the last forty-five years there has not been a day that I have not been the owner of a cow, and during that time there has been very few days when I have not been on hand at milking time Can do a fairly good job all the way through, from milking the cow to eating the butter or cheese. Can manufacture butter or cheese fit for the president, but there is one thing I can't do, although I have tried as hard as I knew how every year since I commenced taking your paper, and that is to convince my neighbors that it would be for their interest to take the DAIRYMAN. A story paper with a column of flashy farm items seems to fill the bill, so I have to give it up, and send you a lonely dollar as a renewal of my own subscription. I have before given my opinion of the DAIRYMAN, so it is not necessary to repeat. Many changes in my way of doing things have come about since I commenced reading it.

Have done my share of shifting about and trying different breeds of cattle, trying

COW. NO. 24, STORRS COLLEGE HERD.

(Beef Type.) Net Annual Loss $2.66.

to find the general-purpose cow, but have now settled on the Jersey. The beef man called yesterday (has kept away since the Jerseys came) said he found beef cattle scarce; heard I had quite a lot of two-year-old heifers and thought some of them might possibly do for beef. I told him I had the heifers, but part of them are making 25 cent butter, and the others will be in the same business in a few weeks. He intimated that it was pretty cold weather to milk. Said I: "It don't pay me to feed a cow 12 months for the sake of milking her 6, and, furthermore, I had as soon be milking in a good warm barn, as to be riding about in search of beef."

You ask how we ripen cream in winter. We try to keep as near the temperature of summer as we can. Have a can large enough to hold a churning, add, stirring thoroughly each skimming till the can is full; now raise and hold the temperature to between 60° and 70° F. Sometimes to hurry up the ripening, we add a cup of sour milk or butter milk, if all right. Stir occasionally until the cream thickens nicely and seems to run smooth off the paddle like paint; when ready for use, reduce the temperature, gradually to about 58° F. for churning; see that the churn is about the right temperature, so as not to change too much the temperature of cream.

Ohio. H. E. HERRICK.

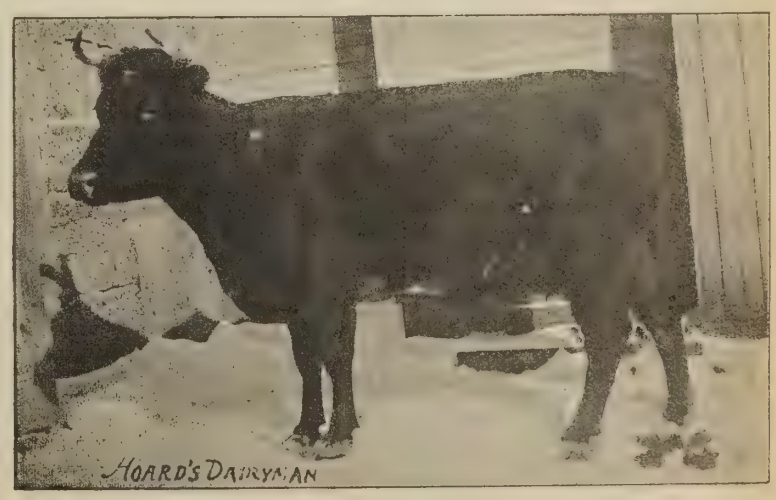
Getting at the Simple Facts.

Fertilizing Values in Feed Stuffs.

ED. HOARD'S DAIRYMAN:—I have been a reader of your paper a year and have never seen its equal to get at the simple facts without so much paraphernalia as some papers advocate.

What we farmers want is an economical way of doing things, as we cannot make as much money as some of these professionals would have us spend getting ready to do business. Then it is the profits that we have to live upon, not capital.

Now I notice in making rations, you don't apparently figure much, if any, on manurial values. I would like to have you tell me how much more oats ground are worth than bran, everything considered. I myself, don't take much stock in manurial values, but if there is a material difference, I would like to know it.



One thing else. How much grain should a cow be fed with 10 pounds hay and 35 pounds well eared ensilage, that is giving 50 pounds of good milk per day?

Give us more pictures of cows and criticise them, so we can tell a good cow as soon as we put our eyes upon them.

Dryden, N. Y. A. D. C.

It was intended to have the above communication and inquiry appear last week, in connection with our revised table of the available manurial values in feed stuffs. That table answers the inquiry, as to the secondary value of oats and bran, by showing that bran is the more valuable. In primary (or feeding) value oats are usually accounted as being worth 10 per cent more than bran.

The amount of grain required to properly feed a cow, that is receiving 35 pounds silage and 10 pounds hay, and is giving 50 pounds of milk daily, will depend in great measure upon the kind of grain. If bran and gluten feed are available, give 4 pounds of the former and 5 pounds of the latter, or 6 pounds bran and 2 pounds cotton seed meal. What is especially needed in connection with such roughage, is grain rich in protein? Corn would be out of place, and oats not first-class. A ton of oats contains only 184 pounds of digestible protein, whereas a ton of bran contains 252 pounds, a ton of gluten feed, 408 pounds, and a ton of cotton seed meal, 744 pounds. It is this larger proportion of protein which gives the excess of nitrogen in the manure, and thereby increases its value. Cotton seed meal is undoubtedly much the cheaper feed at present prices, but it is not prudent to feed much above 2 pounds per day, and not more than half as much as this at first.

COW NO. 25, STORRS COLLEGE HERD.

(Beef Type.) Net Annual Loss $4.09.

Prof. Haecker Answers a Feeding Question.

ED. HOARD'S DAIRYMAN:—I have received the following inquiry from Mr. H. C. Edmunds, of Austin, Minn.:

"Please give me a balanced feed for milk cows, weight about 1,000 pounds.

I have all feed on farm. Ground oats and wheat mixed, half and half in weight, ground corn and cob meal, wheat bran."

It is not possible to formulate an economical ration from the grains mentioned, without using considerable mill products. The wheat and oats are too expensive; better sell the succotash and buy bran and oil meal. Oil meal is recommended in the ration because it contains a high percentage of protein and will enable you to use more farm grown grains. Assuming that the hay contains one-third clover, the following is suggested:

Food.	Pounds.	Dry matter.	DIGESTIBLE. Protein.	Carbohydrates.	Fat.
Hay.....	15	13.14	.72	6.34	.20
Corn & cob	5	4.24	.32	2 81	.14
Bran.....	6	5.37	.75	2.52	.22
Oil meal.	2	1.80	.55	.67	.15
		24.55	2.34	12.34	.71

Another letter from your locality quotes corn at 32c, oats 20c, barley 40c, and bran at $10 per ton. Applying these prices to this ration, it costs 12.8 cents, which makes it evident that profits at these figures are very near the vanishing point. The difficulty is with the prevailing methods of farming. In this matter we are a century behind the times. We raise certain crops simply because our forefathers did. We should pay less attention to market values and more to feeding values. It is well enough to raise succotash, oats, barley and corn, if the crops are to be sold, but if it is our purpose to feed them, it will be well to do a little figuring.

Our farm grown feed stuffs contain all the nutrients in excess of our needs, except that of protein, and to make good this deficiency is why bran, oil meal, gluten meal and cotton seed meal are purchased. It therefore follows that crops for feeding purposes are valued according to the amount of digestible protein they contain.

Let us take, for example, an acre of oats, and assuming that it yields forty bushels per acre, amounting to 1,440 pounds, the average amount of digestible protein found in oats is 9.2 per cent, which makes the amount of digestible protein from an acre of oats 132.5 pounds. In buying bran at $10 per ton, digestible protein costs 4 cents, so the feeding value of the 132.5 pounds of digestible protein found in the acre of oats, is worth only $5.30 as feed for the dairy cow, while its market value is $10. Now, if we sell the oats, it will buy a ton of bran which contains 250 pounds of digestible protein and has a feeding value of $10. So we have exchanged the acre of oats which had a feeding value of only $5.30 for a ton of bran having $10 feeding value. Farmers universally desire to feed the grains grown on the farm, but if they would do just a bit of figuring they would soon free themselves from such notions.

An acre of barley yields, say, twenty-eight bushels per acre, which at forty-eight pounds to the bushel, amounts to 1,344 pounds of barley from the acre. Barley contains on an average 8.7 per cent digestible protein; so the acre of barley contains 117 pounds of digestible protein, which at 4 cents a pound fixes its feeding value at $4.68 per acre. Now, if we sell the barley at 40 cents, the price quoted, we receive $11.20 which will buy 2,240 pounds of bran containing 280 pounds of digestible protein, having a feeding value of $11.20. So we have exchanged the acre of barley, having a feeding value of only $4.68, for bran, having a feeding value of $11.20.

My grandfather planted corn in hills because his grandfather did; so I did likewise, and when the season was favorable, I found some fifty basketfuls on an acre. The long glistening ears looked fine; some were yellow, some white, some variegated, and now and then there would be a red one. These variations were a great puzzle to me in my boyhood days, and I often wondered why it was so, and if one were better than another, and to test the matter held out to bossy, two, one red and one white, to see which she liked best, and she said she preferred both.

Following the saying, "let well enough alone", I allowed fifty harvests to pass before I began to inquire why corn was good. An acre was planted in hills, it yielded forty bushels, weighing 56 pounds to the bushel, making a total yield of 2,240 pounds. Careful chemical analyses and feeding experiments showed that it contained only one nutrient, digestible protein, that an animal could convert into bodily growth, meat and milk, and that 100 pounds of corn contained 7.9 pounds of this nutrient and that the acre of corn contained 177 pounds of this substance. I also found that the corn stalks grown on the acre contained 38 pounds of digestible protein, making the total yield of the acre of corn planted in hills, 215 pounds of digestible protein, having a feeding value of $8.60.

I also planted an acre of corn so thick in drills that no ears were formed. It yielded 34,650 pounds containing 350 pounds of digestible protein, which, at 4 cents a pound, makes its feeding value $14 per acre.

I might submit many more comparisons, but enough has been cited to show that farmers should give more attention to the comparative feeding value of the grain and roughage they are raising for dairy cows.

Minnesota. T. L. HAECKER.

Salting and Working Butter.

ED. HOARD'S DAIRYMAN:—In the March 10th issue of your paper, Mrs. Rose Seeley Miller, after saying some very nice things about the writer, for which thanks are hereby extended, asks if I will give directions for handling butter so that it will need no second working.

The way we handle it is this: The cream is sour, somewhat thick, but not in the least over ripe. It is aimed to have it about the consistency of good paint. The surface has, before it is stirred, a satiny, glossy look, and it runs from the wooden paddle evenly.

The temperature varies somewhat in accordance with the season. In cold weather, we have frequently churned our Jersey cream at 66° F. and by the Babcock test, the buttermilk showed but the least bit of fat, not enough to make any appreciable loss on the churning. In summer, the temperature is kept as nearly as possible at 62° F. The churn is started at 60° F., or even at 58° F., if the weather is very warm, since the cream warms up in half an hour or so. Some times it is necessary to use ice after the churning has begun. It is always gathered in granules, no matter what the time of year.

Now, just a word of help here to Mrs. Miller in regard to the butter not separating from the butter milk. I have never known it to fail of separation if a quantity of salt is added to the cream when it showed signs of "coming." A handful will do for a small churning; be sure to get enough, that is all; more will do no harm. Some recommend using the salt in the form of brine, but we use the dry salt and find it acts promptly in bringing the butter globules to the surface. Draw off when the granules are small, like fine shot.

Wash in water at about 60° F., revolving the churn slowly for a moment only each time, so the granules will not mass. Never touch them with the hands nor with a ladle of any kind. They are to be kept entirely separate, so far as adhering to each other is concerned. Too much washing injures the quick, fine flavor of butter. It is not best to wash out every trace of butter milk. Two rinsings are sufficient. Let the last water be at a temperature of 62°. Allow the butter to drain in the churn a moment or two, then sift best dairy salt over the granules in the desired proportions. Any experienced butter maker knows with reasonable accuracy the amount of butter which a certain quantity of cream will produce. Turn the churn, if a barrel, so as to expose fresh granules, which are covered with salt as before. A large wooden fork is a good thing to use in incorporating the salt at this point. It is better than a ladle.

When the desired amount of salt has been incorporated with the granules of butter, replace the cover of the churn and revolve slowly ten or twelve times. Open the churn and break the lumps of butter apart. Again

Also For Sale—Children's Ponies and registered Shropshire Sheep. MILLER & SIBLEY, Franklin, Venango Co,, Penn.

replace the cover and again revolve the churn very slowly. This time continuing the process until the butter forms in a compact mass, or perhaps there will be two of these large lumps of butter. I do not know that I can tell just how long this revolving should be kept up for I have never noted the time consumed, but it should not be continued too long. Five minutes is surely the extent. The butter drops solidly from one end of the churn to the other at every turn of the crank, and it gets pretty thoroughly worked in the operation. One will be surprised to see how great a quantity of brine will be expelled as the globules begin to press closer and closer together.

For the past year and a half we have discared the butter worker entirely, as has been noted in these co'umns before. When the butter comes from the churn, it is a firm, homogeneous mass. Packing into tubs or crocks presses out any excess of brine that may be left and not a "streak" or "mottle" can be found in the finished product.

This method of handling butter is so much less trouble than that ordinarily practiced by farm butter makers, that I try by iteration and re-iteration to persuade them to give it a trial.

If one still prefers to take the butter into a butter bowl and press it with a ladle in order to expel a little more brine, of course they can do so, but let this be done at the time it is taken from the churn, rather than later.

As to the amount of brine to be left in butter, our dairy authorites allow consider able "moisture". It is quite true that brine can be found in almost any package of butter. The exact amount which will be found varies according to the temperature of the butter at churning time. I have found that the finer the granules, caused by a low churning temperature, the more water will be held, consequently a greater amount of brine after the salt is added.

It will be found that reworking only does this in the average case. It does expel a little more brine perhaps, but in nine times out of ten this is done at the expense of the grain of the butter. Those granules once solidified must be crushed in reworking.

Why not put all the manipulation neces sary upon it while still pliable, when the granules yield to pressure more readily? Fine salt dissolves very readily when applied to butter in granular form, because each tiny particle is coated with water. This in turn, at once becomes brine after the application of the salt.

Now as to brine salting, I will give my experience, having faithfully tried it some years ago.

Where one has a trade, which calls for butter, only slightly salted, it may answer, but I have not been able to succeed in making it practicable in our case, since we are required to furnish that which is more than ordinarily salty.

Another difficulty lies in holding an even temperature during the time the butter is in the brine. It is difficult to prevent it getting too warm in summer in the ordinary churning room. I can see no possible advantage of this process over the one in use by us, as above described.

The only reason so far as I can see, for thinking that brine is more easily and perfectly worked out of butter, after it has stood awhile, is that when butter "comes" in a soft state it cannot be pressed sufficiently to expel the moisture, as any butter maker knows. Then, standing awhile in a cool place certainly is an advantage. But with a proper temperature, this is entirely unnecessary. Butter at 62° is at its best condition for working, at least with any cream that I have ever had to deal with. This is speaking of that from Jersey or Guernsey cows.

The last argument that "butter is generally very pliable when taken from the churn, and it would be easy to injure the grain by much working" is answered in the above paragraph I think. It should not be too warm, just above 62° for the last rinsing water, then stop working as soon as it looks waxy and solid. Draw the ladle's edge through it gently, and if only drops of brine exude, it is worked enough. Should this run off in a little stream, it is not worked enough.

If the operation is done just right, there will be no undue moisture. If there should be, turn it out of the crock or tub after it is packed. That is easy enough if one objects to selling brine at 20 cents a pound.

As for streaks, should these appear after the butter is cold, it is a sign that the salt was not evenly distributed, and a little more working will remedy that.

Mich. W. C. ROCKWOOD.

Our Special Elgin Letter.

ED. HOARD'S DAIRYMAN:—The aggregate offering of butter was 6,300 lbs.; 1,080 lbs. were withdrawn on a bid of 20 cents; 940 lbs. were sold at 20 cents; 780 lbs. sold at 20½ cents, and 2,100 lbs. at 21 cents. A lot of 1,200 lbs. remained unsold with 21 cents bid. The Quotation Committee declared the market active at 20 cents.

The sales reported were as follows:

Factory.	*Pounds.*	*Price.*
McConnell	600	20c.
East Burlington	540	20c.
Franklinville	780	20½c.
Shattock's Grove	2,100	21c.
Total	4,020	

The sales for the corresponding week of the three preceding years were as follows:

March 21, '98, 11,100 lbs. of butter sold at 18¼c.
March 22, '97, 107,160 lbs. of butter sold at 18@18⅝c.
March 23, '96, 20,220 lbs. of butter sold at 21c.

The New York market, Monday, was reported firm at 21 cents.

The milk contracts for the ensuing six months were made Tuesday, at the various condensing factories, and butter factories in this section. The New York Condensed Milk Company contracted for something over 300,000 pounds of milk daily, at the five factories, Elgin, Carpentersville, Algonquin and Belvidere. At the two factories here, 13,000 cans will be taken daily. The company paid the following prices. For April, 85 cents; May, 70 cents; June, 60 cents: July, 80 cents; August, 85 cents and September, $1.00

The prices are the same as paid during the past three years, for the same period, but the amount of milk received is somewhat increased.

The contracts for the two factories here were made by Superintendent Eno, at the east side factory, and the amount delivered to each will vary according to the demand for bottled milk in the Chicago market. A milk famine in Chicago would cause the whole amount of milk purchased here to be delivered at the west side house, for the time being. The product of the bottling works has increased since the formation of the milk trust, as the company did not become a member of that organization, and is its most formidable rival.

The demand for condensed milk is on the increase, and business has been good during the past year.

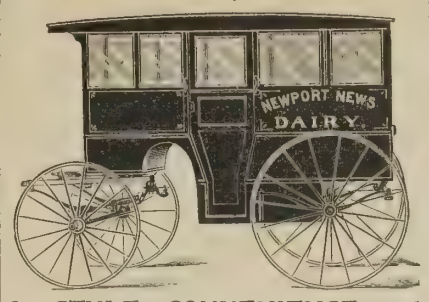
A few dairies have been added to the list, and many of the patrons have been adding to their herds.

The demand for milk has come largely from Alaska and Japan, aside from the regular channels. The recent war has also added to the sales, and a market is being opened in the Philippines, Cuba, Hawaii and Porto Rico.

The average for the six months is about 80 cents a hundred pounds. At the other factories of the company the same prices were paid.

The Elgin Butter company paid 75 cents a hundred for milk and increased the amount of milk contracted considerably. The contracts were made by the gallon at the following prices: April, 8 cents; May, 5 cents; June, 5 cents; July, 6 cents; August, 8 cents.

Oatman Brothers at their Dundee creamery contracted 25,000 pounds and paid for April 85 cents; May, 70 cents; June, 60 cents; July, 80 cents; August, 85 cents; September, $1.



The Illinois Creamery Co., of this city, contracted for 14,000 pounds paying per hundred for April, 80 cents; May, 65 cents; June, 60 cents; July 75 cents; August, 80 cents; September; $1.

W. W. Sherwin, at St. Charles, paid for April, 50 cents per can; May, 45 cents; June, 40 cents; July 55 cents; August, 60 cents; September, 65 cents.

The St. Charles Evaporated Cream Company paid 58 cents a can for April, 40 cents for May and June, 54 cents for July, 60 cents for August, and 68 cents for September. H. C. B.

Elgin, Ill., March 20, 1899.

The World Cannot Show Its Equal

In STYLE, CONVENIENCE and DURABILITY.

Body hangs but 17 inches from ground, and turns can be made in its own length. Sold direct to Dairymen at bed rock prices. For description and price address,

THE NATIONAL WAGON CO.,
Chillicothe, Ohio.

The Scales an Incentive to Increased Milk Yield.

ED. HOARD'S DAIRYMAN:—Mr. T. A. Borman, of Navarre, Kansas, says his cows actually give more milk when there is a pair of scales hanging in the barn. At first thought this may appear ridiculous; but upon a little reflection it is not hard to understand. When a cow gives less milk than usual, the record shows it, and an attempt is made to discover the cause and remove it. On the other hand, when the yield is above normal, the causes are searched out and, if possible, the same conditions are supplied to the rest of the herd.

But I have not the time to bother with recording each cow's yield, says someone. Here experience comes to our aid and tells us that it takes about twelve seconds to weigh and record a cow's yield, or the milk from five cows can be weighed and recorded in one minute; and the extra pains that a milker will take when keeping a record, will more than pay for the time.

Kansas. D. H. OTIS.

Parted In A Dream—(New) A love song founded on a strange incident of the late war—words and music by Halbert L. Hoard. (Regular price, 50c.) Sent post-paid for 25 cts. to readers of Hoard's Dairyman.

Darling Lenore—(New) A song of deep sentiment set to exquisite waltz music, by the same author, published Jan. 25, '99. (Regular price 50 cts.) Sent post-paid for 25 cents to readers of Hoard's Dairyman.

For 3 cts. I will send words of both songs with miniature page of music of each.

An Encouraging Report.

Both As to Cows and a Stave Silo.

ED. HOARD'S DAIRYMAN:—We have a herd of full blood and grade Jersey cows, twenty-two in all. Last year the average was 6,608 pounds milk with an average test for year of 5% by Babcock test.

While you report larger yields than this, we think we are doing very well, as we have only been in the milk business four years. Have raised all our heifer calves, and with but one exception they have proved better than the mother.

We have a stave silo 16×30 feet made of 14 and 16 feet 2×6 hemlock, dressed on one side, without dowels or bevels, with eleven ⅝ inch round hoops, and two flat hoops where the joints come.

Just 3,000 feet of hemlock in silo. This is our second year with it; silage keeps perfectly. S. E. W.

Battle Creek, Mich.

It is wonderfully encouraging both to the editor, who is constantly preaching the doctrine of the profit making qualities of the dairy cow, and to the thousands of readers who are earnestly seeking for the truth in regard to this matter, to have the privilege of reading reports like the above. Cows like those which S. E. W. keeps, even at the present low prices for butter, furnish a cash market for the fodder (hay, silage, etc.,) raised on the farm, thus maintaining the farm's fertility, and, in addition, bring in a net profit of from $25 to $40 each—exclusive of the value of the increase, the skim milk and the manure.

Remember that this is not the report of an Experiment Station herd, selected and fed without regard to cost, as many people erroneously believe, but of a farm herd, under a style of farm management easily attained on any farm, where the farmer is not hampered by old time habits and traditions, and a know-it-all frame of mind. It fully corroborates all that the Experiment Stations have reported and should satisfy even the most skeptical of the high plane of candor and integrity upon which these Stations are conducted.

We are also much obliged to S E. W., for his testimony concerning his stave silo. We especially commend two points to the careful attention of the reader, viz.: Short lumber is used for staves, and the edges are not beveled, nor are dowels used.

We may add that the flat hoops may be dispensed with by simply sawing into the ends of the staves where they come together, and inserting a narrow strip of galvanized sheet iron. Further than this, we also commend the plan of using some form of woven wire fencing for hoops.

Intensive Dairying on Seven and One-Half Acres of Land.

ED. HOARD'S DAIRYMAN:—At Huntsville, Albany county, New York, four miles out from Albany, lives Maria Corey, with her two sisters, Mary and Eliza. With them lives Mr. Henry A. Slack, who was severely wounded in the civil war, while serving under Gen. Alonzo Alden, of Troy.

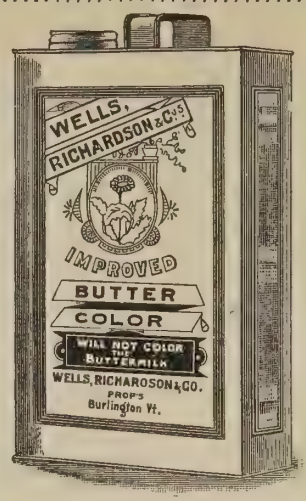
When able to leave the hospital, although in delicate health, and obliged to use crutches in going about, his home was made with this family, and he assumed the management of these few acres. A small Jersey herd of from four to six cows, was established and carried to the best development, to which the most intelligent study and care were given.

A silo was built, 10 x 11 x 16 feet deep, and as young stock increased, was deepened to 20 feet. Two and one-half acres of land are used for growing Leaming corn for the silo. After the silo is filled, this land is put into rye and wheat. On the soiling plan the rye is cut and fed to the cows in the following spring, and ten days later the wheat is ready.

This green food has kept the cows as late as the middle of June, with as many as three tons cured and put in for winter feeding, when the ground would be ploughed and again planted to corn.

It has been demonstrated in this place that ten head of stock can be well kept for five months on one and one-eighth acres of Leaming corn in the silo, while two and one-half acres will keep six cows for a year. Two and a half acres are covered by an apple orchard and one acre in pear trees.

Orchard grass, oats and peas are grown for green feeding, and always with some surplus to be cured and fed with the ensilage. The winter feed per day is, 40 pounds silage and 8 quarts mixed grain, in the proportion of 6 quarts of wheat bran and, at times, 2 quarts of corn meal, or 3 quarts of Buffalo gluten feed.



The summer feed is green rye, wheat, orchard grass, clover, oats and peas, besides 4 quarts of wheat bran and 2 quarts of gluten feed. The calves were raised with great care. They were always strong and healthy; their food was carefully provided and they were well developed, trained, in fact, educated toward the maternal functions. Their bodies were handled to give large development of stomach, and strong digestive power; their udders and the veins leading to them were manipulated, and developed to that extent that one heifer began milk secretion at eight months of age, and she had to be milked thereafter until she dropped her first calf. This is a remarkable instance of calf training, and early development of maternal function. We recall a visit to this home, when this circumstance occurred, and advised, as milk secretion had been stimulated in this calf and the udder was filling, the one safe thing to do was to take the milk from it.

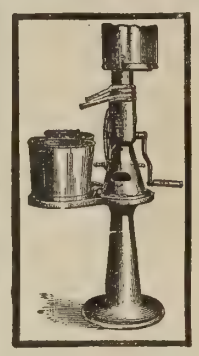
We give a record of income from these few acres, for four years, which was entirely from the cows, with the exception of sales of fruit and vegetables, which range from $136 to $255 a year:

	Cows.		*Fruit and Vegetables.*	*Total.*
1893	5	$963	$200	$1163 00
1894	4	667	250	9 7.00
1895	5	600	136	736.00
1896	4	588	255	843.00
Totals		$2,818	$841	$3659.00

As the calves from this herd sold for high prices, we give the cash product per cow, not including the calf.

The butter was sold to the groceries in Albany, at prices ranging from 22 to 30

Always Use the BEST.

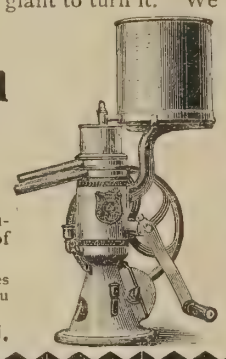


The temptation to try a cheaper article in manufacturing high grade goods is such that the experiment is often undertaken and results generally in producing an inferior article.

High grade butter needs the best of appliances and skill and particularly the best Color.

WELLS, RICHARDSON & CO.'S IMPROVED BUTTER COLOR

has maintained its reputation as the best. It is always reliable and gives the true June shade.



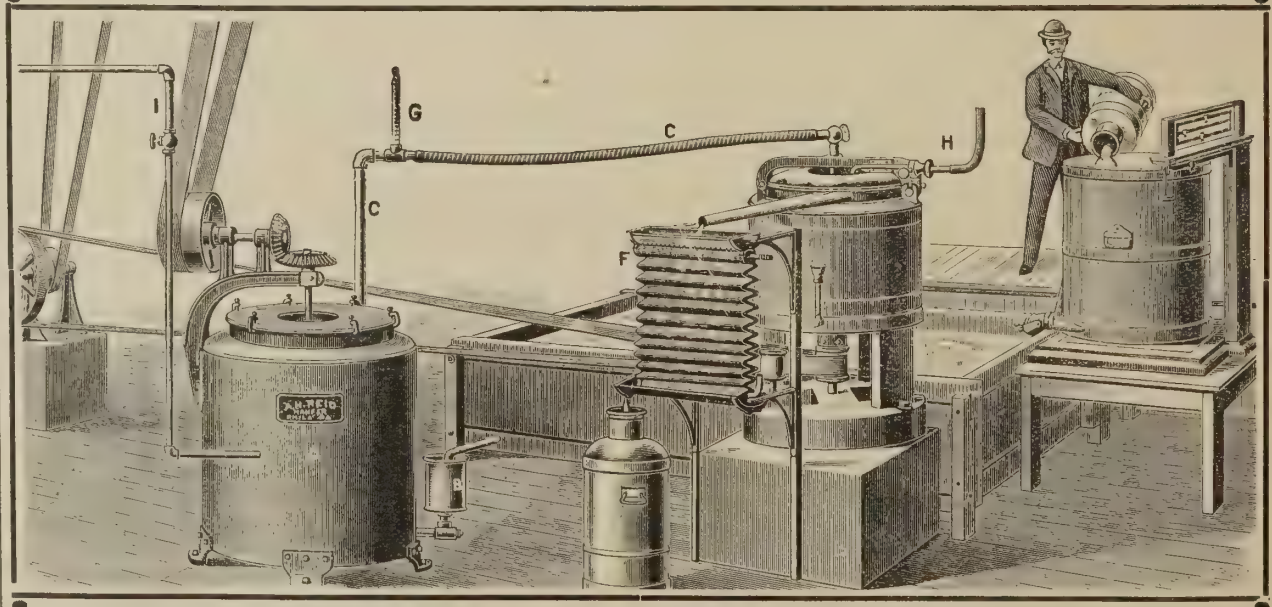
"THE KIND THAT HAS NO MUD."

A Hand Separator

to be profitable must not only extract every particle of butter-fat from the milk, but must run so easily that it does not require the strength of a giant to turn it. We guarantee the

Empire Cream Separators

to run 50 per cent. easier than others of equal capacity. Their record for clean skimming is unequalled. We have the most complete line of hand separators in America; also power machines.



We have not space here to tell you why the **Empire** machines excel all others, but it's all in our catalogue. Send your address if you have one cow or one thousand

U. S. BUTTER EXTRACTOR CO., Newark, N. J.

Grass and Garlic

Milk flows through supply pipe and regulating reservoir *B* from Receiving Vat into Pasteurizer *A*, is Pasteurized and raised through pipe *CC* into Separator. Cream flows over Cooler *F*, skim-milk passes out tube *H* to Skim-milk Vat. *I* steam supply pipe and regulating valve. *G* Thermometer.

STILL POND, MD., September 26, 1898.

MR. A. H. REID, Philadelphia, Pa.

Dear Sir:—Early last summer we bought of you a Separator and Pasteurizer. We have found both machines give entire satisfaction. Every fall previous to this our customers have complained of butter tasting grassy. This season, notwithstanding the growth of weeds the pastures have had in them, we have not heard of a single complaint from our customers, and the demand for our butter now, is even greater than we can supply. We find the machine will do all you claim and we are very much pleased with it.

Very truly yours, STILL POND CREAMERY CO., JOS. W. HARPER, Treasurer.

A. H. REID, 30th and Market Sts., PHILADELPHIA and CEDAR RAPIDS, IOWA.

cents per pound, cream at 20 cents per quart and milk at 4 cents per quart.

1893, cash sales per cow, less calf	$117.46
1894, " " " " " "	117.40
1895, " " " " " "	102.00
1896, " " " " " "	117.00

In 1895, the record of four cows is given, showing the amount of milk of each. As cream and milk is sold, thus breaking up the butter record, the churn test has shown, through the year, that 16 pounds of milk made a pound of butter, and on that basis the butter yield can be closely estimated:

	No. Days Milked.	*No. Pounds Milk Given.*	*Butter Yield*
Rosalind Lowndes.	365	9,512	594
Jennie Warren....	365	7,443	465
Dora Lowndes.....	306	8,313	519
Beautiful Belle Lowndes.....	283	7,157	447
Totals.....		32,425	2,025

The actual cash sales for the four cows, were, that year:

Butter, 891 lbs. @ 25c per lb.	$222 75
Cream, 1.156 qts. @ 20c per qt	231.20
Milk, 1,981 qts. @ 4c per qt	79.24
Total	$533.19

As high as eleven head of cattle have been kept on this small farm, and with one hundred and twenty-five loads of manure made annually, the explanation of how this number of stock is kept does not become difficult. It is the same problem again, of improvement of the soil, with its liberal response, when liberally dealt with.

The lesson of the value of intensive methods is here made plain; the results on these seven and one half acres of land are far better than on most one hundred acre farms, with their extensive, careless methods. Not only are these few acres very highly productive, but the few cows present an equal contrast with the larger numbers in larger herds of haphazzard breeding, care and feeding.

Mr. Slack recognized in the soil a law of improvement—great in its possibilities—and he worked harmoniously with it. He recognized the same law in the dairy cow, and worked, not only intelligently, but sympathetically with that, and was rewarded at every advancing step with success.

In this most valuable lesson there should be great inspiration to others. To the man who has stood for the defence of freedom before cannon mouth and musket shot, until his body is shattered and health broken, and in this condition has worked out such results, is due unmeasured gratitude, homage and respect. Henry Slack has not been widely known publicly. He has been forced to work in quiet paths, but as a teacher and exemplar of good work, as they become known, he stands second to no man in the Empire State. GEO. T. POWELL.

New York.

Abortion—An Epidemic.

ED. HOARD'S DAIRYMAN:—I think it was Prof. W. A. Henry who said that it was the merit of Editor Hoard to first recognize the fact that it was to the maternity of the cow that we must credit the dairy business of the world.

This, of course, cannot be gainsaid; that is, the maternity business, whatever the connection Editor Hoard may have had with its discovery.

An obvious corollary is, that to the regular and normal maternity of the bovine race must we ascribe success in the dairy business and by the same token irregular and abnormal maternity would naturally bring disaster. This much as a sort of overture to some remarks on contagious abortion among cows. It has become a very prevalent and alarming disease among the cows of this vicinity.

In one herd of seventy-five or eighty cows, sixty-five of them have aborted within a year and a half. In another herd of fifty cows, ten abortions have occurred within three months. Other herds have suffered more or less. The epidemic is so acute and the disaster so wide spread that it seems to paralyze effort to stay it. The bulletins from the Agricultural Department at Washington have been gotten and read, as well as standard text books consulted, but it seems to the writer that there is need that some of our experiment stations should take the matter up and study it with greater care and devise some means to "abort" the disease in its incipiency instead of waiting for it to run itself out by destroying the usefulness of our very best herds.

I write this hoping that the DAIRYMAN will take up the subject and talk strongly to our scientific men until they will give it more study and accomplish something more than has been done heretofore in eradicating this discouraging and disastrous disease.

Detroit, Mich. A SUFFERER.

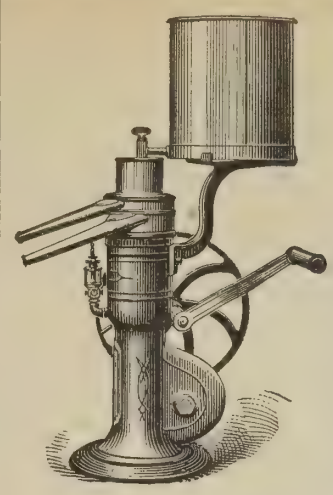
There is no argument so good as an absolute, plain, truthful statement of fact. There is nothing so interesting as fact.

In the true happenings in the every-day life of every-day people are materials for most thrilling novels. There are every day stories of heroism, suffering and the final triumph of good over evil—of happiness finally crowning endeavor. Here is a case in point:

In the county of Escambia in Alabama is the little town of Flomaton and there lives Mrs. Mollie Grimes. She was a good wife and mother but several years ago she found her health slipping away from her. She realized that this meant the inevitable nervousness and irritability that would surely lose for her the affection of her children and husband, and that as her health declined discord and misery would appear in her home. She was filled with the loving motherly instinct, but two miscarriages in succession almost broke her heart. She had almost lost hope when the clouds rolled away and the light of health and happiness returned.



She tells her story in these words:

"I was almost heart-broken to think I could not raise any more children and had to suffer as I did. I had lost two children by miscarriages and I fully expected to lose another when, in August 1897, I learned of and began taking Dr. Pierce's Favorite Prescription and took it until after baby was born in November. With my other children I had suffered everything that flesh could suffer but this time I was in perfect health and had a very easy time. I was in labor only a short time. I cannot praise Dr. Pierce's medicines enough for I believe they certainly saved my baby's life and maybe my own life as well. I took the 'Favorite Prescription' and also the 'Pleasant Pellets. The 'Pleasant Pellets' act like a charm."

This is a fine SOLID GOLD plated initial ring, enameled in black around the initial and is fully worth $1.00. We shall give away 5,000 of these to advertise our business. Send 10 cents to pay postage and packing. *Send size.*
CURTIN JEWELRY CO., Attleboro, Mass.

THE Kansas Legislature has just made an appropriation of $34,000 for the establishment of a Dairy School at the Agricultural College—$25,000 for dairy building, $6,000 for dairy apparatus and $3,000 for dairy herd. Plans for the building are already drawn and work on its erection will begin April 1st. It is expected to have it ready for use September 1st, and will open a fully equipped Dairy School Jan. 2, 1900, with courses in creamery butter making, cheese making and private dairying.

An appropriation of $2,000 was made for Farmers' Institutes, the first appropriation made for this work in the state. The total appropriation made for the college amounted to $110,000.

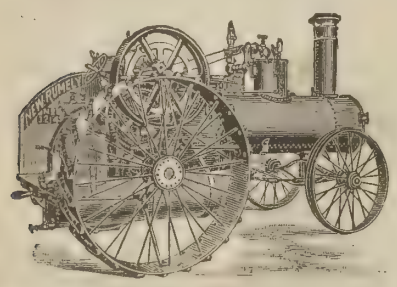
Aerating City Milk.

ED. HOARD'S DAIRYMAN:—In answer to Mr. N. A. Towns, will say, that I am in the same business, and have had a good deal of the same experience he speaks of.

The aerator has done a good deal towards giving the dairy a reputation in Chapter Hill, and I do not hesitate to advise any milk dairyman to invest in one.

I have gotten several people out of the way, who sold milk from one or two cows, by buying the cows, even if I have to pay a third more than the cow is worth. Of course, if I do this the man must agree not to sell any more milk for at least two years.

The aerator mentioned above, is advertised in this paper, and if Mr. Towns has never used one, he will be surprised to see the difference it will make in his milk.



Although it is done by a good many dairymen, it seems to me fatal to put all of the milk in a large can and draw it from the bottom. The man who gets his milk from the bottom of the can, practically gets skimmed milk, and as long as this is done the milk will never be satisfactory, no matter how small the quantity. I put each man's milk in a can or bottle by itself so that he gets all the cream he pays for.

N. C. P. C. WILLIAMS.

ILLUSTRATION.

THE M. RUMLEY COMPANY.

The institution bearing the above name was established forty-six years ago, and has been doing business and growing all these years at LaPorte, Ind. They are manufacturers of a line of machinery that has not only made them famous in this country, but which has been of such quality and superiority as to attract trade from European countries as well.

The M. Rumley separators and engines are known everywhere for superiority of their construction and the uniform high quality of their work. The cut which we present herewith is that of the New Rumley Rear Geared Traction Engine with Friction clutch. It serves in an excellent way to illustrate the high quality of this company's product. This engine is famous for its high power coupled with econony as to steam and fuel; it is the quickest steamer known and is the best of high reserved force; it is possessed of unusual tractic power and takes its lead with ease over the most slippery roads. With all its size and power, it is so sensitive to the stearing apparatus as to be handled with perfect ease.

In addition to this Traction Engine, these people make also Compound Traction engines, Portable engines and Semi-Portable engines. In threshers, they manufacture the New Rumley separator, which combines the apron and vibrating principles, with loading spouts, high wagon elevators, clover hulling attachment, telescope weighing device, telescope bagger, etc. These machines are equipped with the famous Rumley Uncle Tom's Farmer's Friend Straw Stacker; the Rumley Band-Cutter and Feeder and the Rumley Automatic Stacker.

A full line of Dingee-Woodbury Horse Powers, Saw Mills of various sizes and Maurer's Automatic Baling Presses completes the line. Every article is the complete embodiment of good material, good skill and perfect workmanship. Write them for large illustrated catalogue, which they will take pleasure in mailing to our readers.

CONCERNING OUR ADVERTISERS.

NOTE the special offer in this issue made by the T M. Roberts Supply Co., of Minneapolis, Minn. It is too good for any one to miss. Twenty packages of garden seeds free.

THE Farmers' Handy Wagon Co., of Saginaw, Michigan, gives each month, to the readers of the papers in which they advertise, a Handy Wagon. If any of your readers have cards of the following numbers they can get a wagon by sending in their cards. Series A, 1174, 1172 and 2319. Series B, 4129 and 6593. Series C, 1504 and 1314. Series M, 1907. Series N. 8614. Series P, 1663. Series S, 367. Series U, 3203 and 428. Series X, 2459. Series V, 2272. Series Y, 8816. Series BB, 8672. Series CC, 6402.

P. J. COGSWELL says:

"Settles & Settles, of Palmyra, Mo., write me as follows: 'Ophi's Exile, our 75% son of Exile, is getting unusually fine calves. We recently sold a yearling heifer by him for $200.

A report of this kind, in these times of low prices is very encouraging, and shows that the recent depression does not bring ruinous prices to stock of the right individuality and breeding. Ophi's Exile is a 75% son of Exile St. Lambert, by Ophi of St. Lambert 49004, (test 14 pounds, 10½ ounces), she being by Exile of St. Lambert, and dam, Augerez's Violet, an imported cow. Ophi of St. Lambert is a most excellent cow. I have just sold a son of her, by Exile's Successor, to go to New Jersey."

A NOVEL SCHEME.

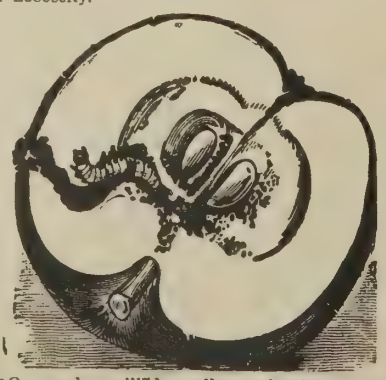
Mr. F. B. Mills, the enterprising seedsman, of Rose Hill, N. Y., whose success has been most remarkable, made so largely on account of his enterprise and fair dealing, has devised another scheme that is equally as forceful and attractive. The ten cent due bill that he furnishes to all who write him for a catalogue is proving a very liberal offer, and our readers need have no fear that they will be unfairly dealt with. Better send at once for catalogue and get a due bill which will help pay for your season's seeds.

The object in making this liberal offer is to induce those not acquainted with Mr. Mills to try his seeds for this season. Mr. Mills feels confident that one season's trial will make a permanent customer.

"NO REMEDY EQUAL TO CAUSTIC BALSAM"

WATERTOWN, Wis., Dec. 29, '97.

THE LAWRENCE-WILLIAMS Co., Cleveland, O — Your bottle of "Gombault's Caustic Balsam" arrived safe, and I feel duty bound to notify you of what an excellent, valuable remedy you have. I am a druggist, a graduate of Chicago College of Pharmacy, class of 1883. I have been in the drug business twenty years; have compounded horse receipts for some of our ablest and most experienced veterinary surgeons, but there is no remedy equal to your great "Caustic Balsam." No stable ought to be without your valuable remedy.



WILLIAM G. CODY, PH. D.

We often wonder if the general public properly appreciate the privilege of doing business with the pioneers and originators of an industry. Undoubtedly, no body else has so many advantages, in the way of knowledge of the business, requirements of the trade, actual needs of the people, best and most economic methods of manufacture, etc., as the active and observing pioneer in any line of manufacturing.

We know that this is true, at least, in the manufacture of green bone cutters. The Mann Green Bone Cutter was the original perfected machine of its kind, and remains to-day the leader among such machines. They have the largest factory in the world, devoted exclusively to the manufacture of green bone cutters, and are selling more machines than all other manufacturers combined. Their cutters embody in their construction every requirement of a perfect machine of this kind, and is the result of ample experience and extended experiment. They will be glad to mail their illustrated catalogue, which explains the cutters in detail, to all interested inquirers. Address, F. W. Mann & Co., Milford, Mass.

SPRAYING FRUIT TREES.

The question of spraying fruit trees to prevent the depredations of insect pests and fungus diseases is no longer an experiment but a necessity.

Our readers will do well to write Wm. Stahl, Quincy, Ill., and get his catalogue describing twenty-one styles of Spraying Outfits and full treatise on spraying the different fruit and vegetable crops, which contains much valuable information, and may be had for the asking

DON'T DESPAIR!

An American Scientists Great Work.

Consumption, Pneumonia, La Grippe, Asthma, Catarrh, Bronchitis and All Lung and Bronchial Troubles Can be Positively and Permanently Cured

DR. SLOCUM'S SYSTEM OF TREATMENT HAS REVOLUTIONIZED OLD-TIME THEORIES.

A Free Course of Treatment for all Sufferers for the Mere Asking.

SCENE IN THE SLOCUM LABORATORIES, NEW YORK CITY.

The Doctor Demonstrating to Medical Men, Scientists, Statesmen and Students the Value of the New Slocum System of Treatment for the Permanent Cure of Lung Consumption, Catarrh and All Pulmonary and Wasting Diseases.

Do you cough?
Do your lungs pain you?
Is your throat sore and inflamed?
Do you spit up phlegm?
Does your head ache?
Is your appetite bad?
Are your lungs delicate?
Are you losing flesh?
Are you pale and thin?
Do you lack stamina?

These symptoms are proof that you have in your body the seeds of the most dangerous malady that has ever devasted the earth —consumption.

Consumption, the bane of those who have been brought up in the old-fashioned beliefs that this disease was hereditary, that it was fatal, that none could recover who were once firmly clasped in its relentless grip.

But now known to be curable, made so by the world-stirring discoveries of that man whose name has been given to this new system of treatment.

Now known to be preventable and curable by following and practicing his hygienic teachings.

The new system of treatment will cure you of consumption and of all diseases which can be traced back to weak lungs as a foundation.

It is not a drug system, but a system of germ destruction and body building.

Not guesswork, but science.

Not a step backward, but a stride out of the old ruts.

Made possible only by Pasteur's Virchow's, Metchnikoff's and Slocum's latest discoveries in bacterology, hygiene and therapeutics.

In plain English, a system of modern scientific disease curing.

The System consists of Four Preparations which act simultaneously and supplement each other's curative action.

You are invited to test what this system will do for you, if you are sick, by writing for a free treatment to the Slocum Laboratories, New York City.

WRITE TO THE DOCTOR.

Send your name and full express and post-office address to the Slocum Laboratories, 98 Pine street, New York, and mention HOARD'S DAIRYMAN, and the Four Free Preparations of medicine will be forwarded you.

The system is a positive cure for consumption, that most insiduous disease, and for all lung troubles and disorders complicated by the loss of flesh, Coughs, Catarrh, Asthma, Bronchitis, etc.

Thin, pale, weak people become fat and hearty by its use.

The test is to try it.

VETERINARY.

Queries in this department answered by WM. HORNE, M. D. V. S., Janesville, Wis.

COW PHYSIC—Three-fourths to 1¼ pounds Epsom Salts (according to age and size of animals) and two ounces of best ground ginger. Pour over this three pints of boiling water. When at 105° F., give gradually as one dose.

GRUBS IN BACK—HOLLOW HORNS AND TAIL.

How can I prevent worms or wolves from getting in cow's back? What is the disease that causes a cow's horns and tail to get hollow, and the remedy? We in the south call it hollow horn, but you say there is no such thing as hollow horn, but there are a great many cows die with this disease. J. D. P.
Austell, Ga.

ANSWER.

See article last week, or so, for grubs under the skin. Never saw a cow's tail that was hollow—never. Sometimes the tail of a cow becomes limp in places, but this is by no means a disease; it is a diseased tail, caused by some disease—organic or otherwise; of these there are several. The cure is to find the disease which is the cause, and cure it.

MILK FEVER.

On March 11th at 6 a. m. a mature cow gave birth (without aid) to a dead heifer calf which was due Feb. 22nd. The cow seemed all right and at 9 a. m same day cleaned nicely, ate and drank during the day in perfect ease.

At 8 p. m. she seemed comfortable and in good spirits; at 6 a. m. next day found her down and unable to arise. Called a veterinary. Hind legs and back useless, remained in this condition, growing worse, until 2 a. m. next morning when she died. Feed before calving, 1 pint ground rye and oats mixed in equal parts and 2 quarts bran per feed, clover hay, oat and rye straw mixed.
Leroy, Ind. C. B. B.

ANSWER.

If the cow came to her milk at all you had, unmistakably, milk fever. The reason for or cause of the dead calf is quite beyond my knowledge as there are so many different things which might have been the cause, accidents of any kind colds, etc., in getting up or in lying down, slipping backward with either or both of the hind legs, etc.

HARD MILKING.

I have a Jersey cow fresh in milk. One quarter of her udder is wrong. To all external appearance it is healthy, no cake or inflammation, but will only give me a good stream followed by several small streams, each succeeding one smaller than the one before, until no milk at all flows. By waiting, p rhaps, one minute, the above is repeated. By reaching well up on the udder with one hand I can bring down a sufficient amount of milk for one good stream. Then by taking the other hand, and by making two or three strips, I can get a portion of that milk, but I can feel some of it pass back by the hand I am holding it down with. Through all the squeezing and stripping the cow goes right on eating, showing that it does not hurt her. K B. J.
Allegan, Mich.

ANSWER.

You need the best and easiest milk tube to be had; read ads. in the DAIRYMAN. I expect the difficulty is from the membrane overcapping the head of the teat.

INJURY TO BULL FROM LOSING HORN.

While in excellent health, apparently, my bull slipped and broke off one horn. He bled profusely. We had great difficulty in stopping it. He ran down rapidly for some weeks after that, became very thin, though still ambitious. Ate heartily, but would not gain in flesh until the last few weeks. I am not now allowing him to breed, but he was so used for several weeks after the accident. How long should I keep him from service, if at all? Several heifers bred to him, both before and after the accident, still come in heat. Would say he also caught a cold, apparently. He ran at the nose a mattery substance and has still a light, loose, windy, infrequent cough.
Adams, Wis. G. L.

ANSWER.

You do not have tuberculosis, in my opinion, by any means. I think the injury which resulted in breaking off the horn is responsible for the depressed condition. Time and good care will recruit him, I think Don't care to medicate him at all. Feed good and nutritious food. No, don't let him serve for a little while, at least. Wash out the nostrils with bromo chloralum one to eight of water. Inject each nostril after washing—a little only.

SKIN DISEASE.

Will you please tell what is wrong with my calves? They become scaly around the eyes, and several of them have sores or scaby places at the side of the mouth. The hair comes off, but they are not very sore to touch them. The calves are doing well otherwise.
Will buttermilk remove lice from cattle?
Abilene, Kan. C. C. W.

ANSWER.

You have some form of skin disease and the treatment is the same for all and any. Pull off all the affected scabs; wash carefully with Tilden's Bromo Chloralum one to eight of water. After drying paint over the affected spots with tincture of iodine. Be very careful not to let it get into the eyes.

For lice use tar soap, and thoroughly rub into the bottom; then oil of tar one ounce; fish oil one quart. Rub down to the bottom of the skin.

Don't know about the buttermilk killing lice. It might.

FAILURE TO BREED.

Three of my best cows are doing very unsatisfactory indeed. One I think, has womb trouble. She hasn't dropped a calf in more than two years. She is regularly in season, but does not conceive. She has very offensive discharges, commencing about ten days after having been served, and continuing three or four days. Nearly every morning there is a tablespoonful of blood under her. Her appetite is fairly good at present; generally it is poor. She is thin and gives very litttle milk. J. B. G
Paschal, Ga.

ANSWER.

You need an examination by an expert. Service is quite contrary to logical conclusions, and always makes bad worse. She may or she may not be affected as you intimate. She may be suffering from chronic nymphomania, resultant from affection of the ovaries, or some portion of them. An examination can alone determine this.

SKIN DISEASE IN HOGS.

My hogs are affected with what I believe to be mange. They have small pimples on skin along belly and between legs. Sometimes a part is much tumefied and inflamed, and continues for some time. These symptoms are accompanied by severe itching, continual scratching and rubbing. In the fall I had them in open pens which were not fit for hogs during wet weather, but now I have a good, warm, dry, clean shelter for them. A SUBSCRIBER.
Ackermanville, Pa.

ANSWER.

You require and must have personal attention to your hogs Remove all the more affected to a high, dry, clean place. Scrub the affected with tar soap and hottish soft water, and give one ounce of castor oil and one ounce common turpentine. Repeat every second morning up to three doses. Get a genuine veterinary surgeon at once, and do as he recommends. You have a bad disease.

INJURY TO BULL.

What is the matter with my Jersey bull, 15 months old? Served cow three weeks ago all O. K., put him with another on the 10th, and found on his first attempt at service that the blood run from navel in a stream. Found no sore or cut, but seemed very sore.
Do you think he will recover?
Manilla, Iowa. C. W. W.

ANSWER.

I can't tell you. You need a personal examination of an expert. There may be a tumor out of your finding. There may be a rupture of the sack lining the base of the penis. He may recover, but such cases are doubtful.

CLOSED TEAT.

Can you inform me how to cure a teat (on a young cow) that is closed with a redish scab? Each time we milk, no milk can be drawn till the vent is picked open.
Kerrmoor, Pa. SUBSCRIBER.

ANSWER.

You need a good easy plug and an easy tube for a while. See ads. in DAIRYMAN. I know of no other equal remedy for just such cases.

COLD

One of our cows, fresh four or five days, in good condition, six years old, taken with sneezing, eyes swollen, most shut, and run water in great quantities. Backs in her stall, turns her head to the right side. Her rectum swollen the same as her eyes. Was the same last year; got over it in a few hours so she would eat but eyes were swollen quite often last summer. SUBSCRIBER.
Portage, Co, O.

ANSWER.

If large, 1½ lbs. of Epsom salts and two oz. of best ginger and one dram of nux vomica. In five days repeat with one pound. Bathe the eyes with sulphate of zinc, ten grains, water, cold, one pint. After the salts give two drams of podophyllum and half a dram of nux vomica in 3 ozs. of old whisky and 4 ozs. of cold water every alternate day for three doses. Then wait a week and give one more dose. If needed, inject the vagina with Tildon's Bromo Chloralum, one to eight of warm water, use liberally for three days.

Truth is stranger than fiction
You know it
And
You forget it
Until something happens
Then
You realize it
Thus
That enormous output
Of machines
For which
McCormick is famous
All over the world
That output
Which dwarfs all other outputs
By this shrewd advertisement
Shows its mammoth proportions
And you are astonished
Yet you knew it
Knew it well
Truth is truth but it needs

A Strange Reflection to emphasize it.

The McCormick Harvesting Machine Company of Chicago built and sold 189,760 machines in the season of 1898 just past.

H. W. KELLOGG COMPANY, Ripon, Wis

Dairy Straws from Ohio.

Why Creameries Do Not Pay.

ED. HOARD'S DAIRYMAN:—Only here and there over Ohio does the creamery business seem to be a success. There are more of them that are in operation under a non paying basis, than of those that pay.

It is so seldom that creameries prove a real active paying investment, that we feel like making inquiry into the real reason why they pay, and also why they do not. The reasons are various, and also numerous.

Co-operative concerns have failed to respond to the wishes of those who have created them, largely, because the investors have failed to provide the sinews of war, namely milk, or, on the other hand, provided poor government for maintaining them. It is a notorious fact, that farmers will not combine together for their own defence, or if they do, will break faith with each other at the first rupture that may occur, and with unforgiving spirit, sink good hard cash rather than stay together for mutual and self protection. Co-operation in creamery work is by far the best, and cheapest means for dairymen to manufacture and market butter or cheese, but history fails to prove the fact. Nevertheless, with the bad record of such concerns, we do not believe that the reason why so many of them have been absorbed by private individuals is, not because the principles of co-operation are not right and perfect, but as we have already said, the fault of men and not the other.

It is a fact that but few men are competent to take charge of the business of a creamery, and especially without experience, and very often men here in Ohio are doing that very thing. They have been successful in their own business, and, for that reason, pushed to the front, when a creamery organization is perfected, and very often resulting in closing out of the plant, either in a short time or after lingering some time, collapses with disastrous results.

We know of a number of both co-operative and company concerns, that, failing to succeed in first hands, have been closed out at low figures, and under the management of the purchaser made paying affairs.

There are so many intricate things connected with the practical work and running of a creamery, that few men acquire the line of knowledge that successful work requires.

It may have been possible in years gone by, that some men have, by a mechanical business tact, made factory handling of milk pay, but to-day success for the beginner demands an education that will enable him to take up the work in a scientific way. The study of bacteria has become a part of that education, without which the young man who expects to make a first-class operator must become studiously familiar with, if his product seeks the top of the market, and expects it to stay there week after week, or by the whole year.

The owner of a creamery, who has not become familiar with the fact that the churn gain on high testing milk is higher than that of low testing milk, has already passed the place where is likely to make a paying success out of his plant.

Too many fail to comprehend that each pound of butter fat creates the same amount of gain, but that the loss sustained in the skimming and churning is the same in each class of milk; hence the percentage of loss to each pound of fat is greatest upon the poorer milk; hence the claim that the richer milk gives greater gain over the other. Just the lack of a fair comprehension of these facts has led many factories into trouble, by paying patrons not only for butter fat, but dividing the gain at the churn, upon an even divide, regardless of the difference of per cent of butter fat. We have known where patrons have left creameries, because of the fact that other patrons who brought in 3.5% milk against their 5% product, got an equal share of the gain.

We have knowledge where one factory went into debt head over heels, by the use of a popular butter calculator in making out churn gains from the fat tests, when there must have actually been little or no churn gain, from the fact that there was a high percentage of loss in both skimming and churning.

Experience has taught us that the creamery business demands a kind of book keeping unlike any other vocation. The ordinary double entry mode of keeping books, with books posted every month, with balance struck as often, does not afford sufficient knowledge at the end of each year to tell correctly how the business stands, where the above facts have been found to exist. The plan employed to correct the faults of this particular system, was to place each month's expense in that month's account, even if that money had been spent months before and placed to a separate account.

At the close of the year the business for that year was closed to date of settlement; product unsold, or on hand, invoiced at probable market price and a report made to stock-holders, and any deficit or gain attached to the first month of the year.

While this may not be the very best plan to follow, yet it has given satisfaction, inasmuch as the factory knew at the end of each year whether or not it came out ahead or behind.

We have reason to believe that the most successful and satisfactory creameries are those owned by individuals and conducted by their single ideas of what is best and conducive to success.

One plant, costing $5,000 put up and operated a short time by a company, sold for a small sum of money to a young enterprising man, and for years has made 1,600 lbs. of high grade butter daily, that finds its way into a large city at top prices. Others have done the same thing and will continue to do so.

Only last week, the writer stepped into a $3,700 plant that had recently been sold for less than $700 to the proprietor, who was batching it, and with the aid of a boy was running it himself, and by seeing to the selling himself, was making the plant pay him a fair compensation for time and money invested. Take a circumstance like this and make a comparison with an expensive plant on which a six per cent dividend must be paid by patrons if co-operative or for a joint stock company; the same ice, supplies, and from $50 to $75 per month for operator, the monthly expense will run from $110 to $150 for each calendar month.

It is useless to talk about a co-operative or stock company running a plant as cheaply as will a man who has the absolute ownership of it. It is simply out of the question and does not admit of successful argument.

Were I wanting to help start a creamery in my locality and wanted it to be a success, so as to continue my patronship, I would rather subscribe the money as an individual with others and when the plant was completed, turn it over to a trustee with orders to lease it for ten years or more to a good creamery man who was a success, for the magnificent sum of $1, at the end of which time, if kept in successful operation and repair by him, have said trustee turn the plant over in full to him, as a reward for his pluck and as a public benefactor, and I will make money by having it just that way. All this may seem strange, but after going through the grind once or twice, a fellow's foresight gets almost as good as his hindsight. At least, he does not care to be burnt twice in the same place, hence, avoids being cauterized. Here in Ohio a responsible man is liable for twice the stock he subscribes for, and cannot avoid responsibility by sale or transfer, after any debt may have accrued, unless incorporated under the laws of a limited corporation.

I doubt not but some party who has been connected with a successful concern, will attack this assumption, yet it is a noted fact that a majority of such creamery companies get to the place where they are compelled to squeeze their stockholders.

With the light that experience has taught us, and we were raising money to erect a creamery, it would be upon the plan we have urged, practically upon the gift plan, and forever closing up any gaps for doubling up subscriptions.

Had such a plan been in vogue for the past ten years, there would be less howlers, more substantial creameries and more farmers on the road to affluence and wealth.

Who will throw the first stone?

GEO. E. SCOTT.

ARE YOUR KIDNEYS WEAK?

Have You Bladder or Uric Acid Trouble?

YOU MAY BE AFFLICTED AND NOT KNOW IT.

By Special Arrangement, Every "DAIRYMAN" Reader, to Prove for Themselves the Wonderful Merits of SWAMP-ROOT, the Great Kidney Remedy, May Have a Sample Bottle Sent Absolutely FREE by Mail.

People are apt to believe that kidney disease is rather a rare disease, but recent discoveries have proved that it is a most common trouble indeed.

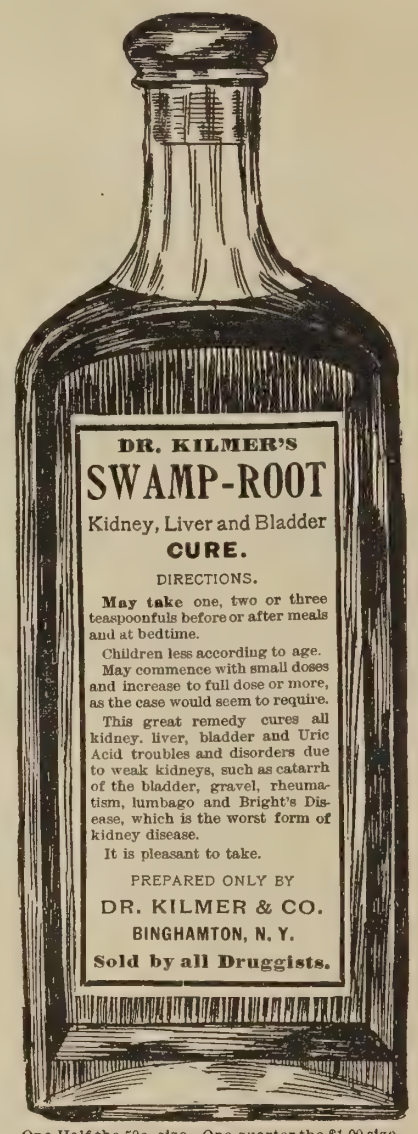
And the proof of this is, that most diseases, perhaps 85 per cent, are caused in the beginning by disorders of the kidneys.

You can't be sick if your blood is pure, free from kidney-poison and disease-breeding germs. Your kidneys should keep it so. That's what they are there for. And as long as they are well they perform their duties with thoroughness and dispatch.

You are well when your kidneys are.

Dr. Kilmer's Swamp-Root, the great kidney remedy, will make your kidneys well when they are sick.

Kidney trouble often comes from overwork or over exertion. From exposure to cold and other weakening influences, from lifting or a strain, from over-eating or drinking. All these things weaken you kidneys, and poisonous germs begin to creep into your blood.



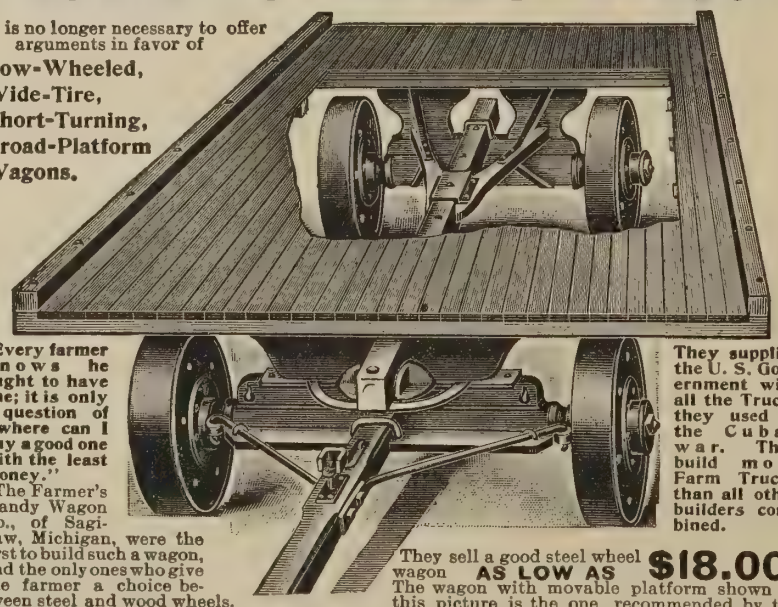
It is at just such times that Dr. Kilmer's Swamp-Root is needed.

When your kidneys are not doing their work, you have backache, headache, sediment in urine, scalding irritation in passing it, obliged to go often during the day and to get up many times at night, dizziness, or irregular heart, bladder or uric acid troubles, rheumatism, neuralgia, sleeplessness, nervousness, irratability, sallow complexion, bloating, dropsy, tired feeling, loss of energy and ambition.

Swamp-Root is the great medical triumph of the nineteenth century; discovered after years of untiring effort and research by the eminent kidney and bladder specialist, Dr. Kilmer, and has truly wonderful restorative and healing action on the kidneys and bladder.

The best proof of this is a trial, and nothing could be fairer than the offer to send a sample bottle of this great discovery absolutely free by mail.

To get a sample bottle and a book giving some of the thousands upon thousands of testimonial letters received from sufferers cured, write to Dr. Kilmer & Co, Binghamton, N. Y., and mention that you read this liberal offer in HOARD'S DAIRYMAN.



One Half the 50c. size—One quarter the $1,00 size.

If you are already convinced that Swamp-Root is what you need, you can purchase the regular fifty-cent or one-dollar sizes at the drug stores. Don't make any mistake, but make a note of the name, SWAMP-ROOT, Dr. Kilmer's Swamp-Root, and remember it is prepared only by Dr. Kilmer & Co., Binghamton, N. Y.

FARMER'S HANDY WAGON

It is no longer necessary to offer arguments in favor of **Low-Wheeled, Wide-Tire, Short-Turning, Broad-Platform Wagons.**

Every farmer knows he ought to have one; it is only a question of "where can I buy a good one with the least money."

The Farmer's Handy Wagon Co., of Saginaw, Michigan, were the first to build such a wagon, and the only ones who give the farmer a choice between steel and wood wheels.

They supplied the U. S. Government with all the Trucks they used in the Cuban war. They build more Farm Trucks than all other builders combined.

They sell a good steel wheel wagon **AS LOW AS $18.00.** The wagon with movable platform shown in this picture is the one recommended by the Agricultural Colleges and Experiment Farms, and is the only truck ever adopted by the U. S. Government. The platform is easily removed and stakes placed on bolsters, then it is ready for an ordinary wagon box. The wheels turn under the load. **Send for Catalogue and prices.**

FARMER'S HANDY WAGON CO., Saginaw, Mich.

Steam in the Dairy.—A Good Jersey Herd.

ED. HOARD'S DAIRYMAN:—I will add a mite in favor of steam in the dairy. In the first place, hot water is a necessity, and the quickest and best way to get it is with steam. Second, fuel in the shape of wood is abundant on most farms. Third, the cost is considerable less. I am using a 1½ horse power tubular boiler and a one horse upright engine, which runs a De Laval separator, a Mason butter worker, a Stoddard barrel churn and a steam Babcock tester. There is a tank with a steam pipe running to it, that heats water for washing and sterilizing the utensils. I have seen a good many rigs, but after using this a year I see no place where I would change.

I am running Jersey cows, which average 300 pounds each of butter, and test from 4.8 to 6% of fat—that is, churned butter, besides supplying milk and cream for a family of four, and some sold to neighbors. Am feeding 15 pounds ensilage, and what hay they want, with 8 pounds mixed grain, corn, bran, cotton seed and middlings equal parts by weight; nutritive ratio 1 to 5.9; cost 15½ cents each for cows in full flow of milk. How is that? D. H. HILL.

Strafford Co., N. H.

Wise Words From Prof. Robertson.

No man on the American continent has a keener insight into the true philosophy of dairy management, or a truer foresight as to coming changes and modifications which shall affect the export demand.

At a recent meeting of dairymen in Canada, he spoke the following words of wisdom:

Farming concerns, as no other calling does, the sense of fair play in getting a living. A farmer doesn't get anything for nothing. He has to give an equivalent for everything, in stock, or labor, or something else. All other people, sometime or other, get something for nothing. For himself, he goes off on a holiday for a couple of weeks every five or six years, and his salary goes on just the same. Farmers make more money for the country than any one else, though they don't always keep it for themselves. We get $30,000,000 from our mines; $20,000,000 from our fisheries; $80,000,000 from our forests. Against this, we get $600,000,000 annually from agriculture.

With the great Anglo-Saxon race, the masterful sense is the sense of taste to the last. They are always working to get something for their mouths.

The thing that has developed the cheese business in Canada was that each factory was an object lesson to all who saw it, and farmers thought if another locality could have one, they could also have one in their own locality. This has increased our exports of cheese ten fold in a few years. Farmers should apply this principle of profiting by their observations, in other lines as well.

There is a growing demand for butter, but the lecturer thought that during the next ten years or so there would be a shrinking demand for cheese. The reason is that cheese on the tea table is coming to be considered unfashionable in England. The coming trade for the British tea table is cold ham and chicken and there is a hint in this for eastern townships farmers. The demand will grow for butter, because the people always eat bread and butter with their cold ham and chicken. These things Prof. Robertson had observed while in England. He advocated development of the pig and poultry trade along with manufacturing as much cheese as they could get a good price for. He then went into the question of what sort of swine should be raised. The difference between the many different breeds depends on the shelter, the feed and the care given. Any breed can in three generations be degenerated by neglect. So a poor hog may be bred up to a high class, but it will take a much greater time. It is always easier to destroy than to construct. Breed is the accumulation of someone's skill and management. With a pig a habit can be formed in five weeks that it will keep for a lifetime.

CARE REQUIRED.

The fact that a hog grows without much hair shows that it should be sheltered. There is no means of making a pig thrive when the wind blows on it. He never saw a pig willing to stand in the wind. The pig should also have a warm sleeping place and a dry one. One of the great troubles in making a pig pay is that it lies in a wet place. The floor of the pen should slant; this will keep it dry and will lessen the necessary labor of clensing the pen and the pig. The walls should be made so that they will be free from draughts. He would never build a stone pen in Canada, nor a cement floor to the pen. There should be plenty of light. Nothing promotes health in nature more than an abundance of sunlight. It kills all disease germs. After the pigs are weaned, they should be given a pasture where there is plenty of grass. Clover and skimmed milk will make pigs grow faster than anything else. Pigs should not be fed more than a quart and a half of milk a day. This, with some ground grain, will make the best bacon.

Referring to the value of oats for feed, the speaker said that the eastern townships farmers might produce better oats than they do. The peasant farmers of France grow eighty bushels of oats to the acre. And in that country the soil and climate is no better adapted than this to the growth of oats. The farmers here should grow twice as many bushels to the acre as they are getting. To get good seed, Prof. Robertson advocated that the farmer should go out to his oat field and clip by hand the best, earliest ripening, and largest heads of grain.

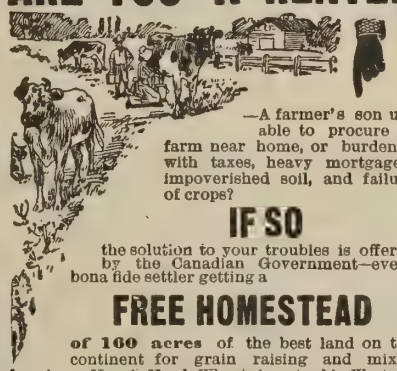
Returning to the feed of pigs. Prof. Robertson said that the feed should be always such as will keep them growing. They should be finished off on half corn and half oats, or some other grain. Farmers should get an average of two pounds of gain for every one hundred pounds of whey fed, and five pounds for every one hundred pounds of skim milk.

In answer to a question, Prof. Robertson said that since 1896 we have gained in our exports of bacon over 82 per cent.

For special bacon pork the hog should weigh about 180 pounds, live welght. The hog should not be fed very fast, and should be given plenty of exercise. This produces length and a thin back, desirable for bacon pork.

POULTRY FOR MARKET.

The fattening of poultry for the Engiish market was also gone into extensively by Prof. Robertson, and the possibilities of the expansion of this trade opened the eyes of many of his listeners.



About half the lamp-chimneys in use are Macbeth's.

All the trouble comes of the other half.

But go by the Index.

THE NEW BOOK
Feeds and Feeding

By Prof. W. A. HENRY.
Wisconsin Experiment Station.

This book should be in the hands of every stock feeder in the country. Every reader of HOARD'S DAIRYMAN ought to have it. It is a large, well bound book, nicely printed, over six hundred and fifty pages. Price $2.00.

Four Yearly Subscribers at $1.00 Each ($4) Will Secure It as a Premum.

or

Four Yearly Subscribers at $1.00 Each ($4) Will Secure It as a Premium.

Of This Book Hon. JAMES WILSON, Secretary of Agriculture, Washington, writes as follows:

"Prof. W. A. Henry, Dean of the Agricultural Department of the University of Wisconsin, has recently given to the American student and the American farmer a work on feeds and feeding. Singularly enough, up to this time we have had nothing along this line sufficiently comprehenisve from both the scientific and Practical standpoints. We have had very able works from both, but Prof. Henry is the first to combine science with pratice, and give us a work that will be of value alike to the instructor in the Agricultural College, to the student who is seeking the principles underlying feeding, and to the practical farmer who feeds.

This publication will take its place immediately in the college library, and ultimately in the private library of every farmer in the land. When the instructor, student or practical farmer inquires where there is a work thoroughly exhaustive of this subject, he can now be refered to Prof. Henry's book.

Send as above, or will be forwarded, carriage paid, on receipt of price $2.0

ALFALFA IN NEW YORK.

Mr. F. E. Dawley, superintendent of Farm Institutes in New York, informed us, while on a recent visit to that state, that fully one-half, if not more, of the hay harvested in his township, (Fayetteville, Onondaga Co.) and the adjoining township of Sullivan, Madison Co., the past year, was Alfalfa. Central New York farmers are coming to regard alfalfa with great favor, especially where cows are kept. It seemed almost like attending an institute in Colorado or Washington to hear the New York farmers discussing the alfalfa question as they did. We venture the assertion that in ten years it will be found on nearly every dairy farm from the Atlantic to the Pacific.

Oklahoma Cows Give But Little Milk.

ED. HOARD'S DAIRYMAN:—I read your paper carefully.

I read some of your readers claim of making from $40 to $60 a year from a cow. I say we have very fair cows, but we can't average but $15 per cow a year. Now there is something wrong somewhere, and I would like to know where it is. If you could help us and show where we make the mistake, (if we make any,) so that we could come anywhere near to what your readers claim, I am almost sure you would get some subscribers here. People say these newspaper men write a good deal, but it can't be done. To tell the truth, I have done all I possibly could; but making $40 per cow a year it is of no use to talk about it. I only keep seven cows, one thoroughbred Jersey, 4 grade Holsteins, and lately I got 2 registered Ayrshires. All become fresh lately. Sixty pounds of milk a day from seven cows, and the milk for two calves say 30 pounds. I feed all the corn stalks (fodder) they can eat, 6 pounds bran a day, and some corn in the ear. They have warm stable well bedded, good fresh water, we will milk regularly and clean, and have all the salt they want. Cotton seed meal we can't get, but we could get the seed $6 per ton. Would corn stalks, (fodder) bran and corn make a good feed for a dairy cow? Please let me know.

We can't raise timothy or clover. We could raise oats and make oat hay. Will oat hay be good feed? We could raise sorghum and make hay, but some neighbors say sorghum is not good feed for milk cows. What do you think about sorghum hay? I often read that you are doing and have done a good deal of good; now if you could do anything for us, do it, and we will surely be thankful and repay for same. We are running the cheese factory here, and would like to see our patrons making some money out of their cows. So far, it does not pay to keep milk cows and take the milk to the factory. We are paying from 50 cents to 75 cents per hundred pounds milk in summer. Now Mr. Editor, I hope to hear from you, and try to make us a ration for milk cows, if it can be made. Corn stalks (fodder), bran, $11 per ton, corn, 30 cents a bushel. In the fall we can get cotton seed $6 a ton.

Okarche, Okla. C. H. & SON.

The trouble is the cows are not fed right. A cow to do fairly well, must have at least two pounds of digestible protein in her daily ration. Corn fodder, such as is raised in Oklahoma, contains but 2.5 pounds of protein in 100 pounds of fodder; it will therefore be seen that in, say the 25 pounds she might eat, she would get but 6¼ tenths of a pound of protein. A good deal more must be provided in some way. If enough wheat bran, which contains 12.6% protein could be fed, that would supply it. But that could not be afforded with the low price of milk and the proportionately high price of bran. If our correspondent will look over the table of the analyses of feed stuffs, published in the DAIRYMAN of November 11, 1898, he may be able to select some of the feeds with which it will be practicable to provide the necessary protein. To be economical, this, in a great measure should be obtained in the coarse fodder.

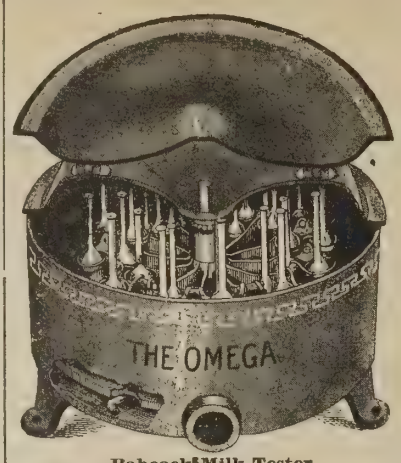
Alfalfa hay, or cow pea hay, or both, each of which contain about 11% of protein, would be just the thing. We believe these could be raised in Oklahoma. Oat hay, if cut early, soon after heading, is much better than corn fodder. Another thing must be thought of, a cow needs a variety of foods. She cannot do her best on one kind of food, no matter how good it is. Alfalfa hay, with some corn fodder and oat h ay, and bran with a little corn, would make a good daily ration.

If an effort is made the coming summer to grow these feeds, we believe the cows will do much better next winter and bring in a yearly return of more than twice $15 each, provided the summer pasture or feed is good and they are not too much tormented with flies and other insects.

Sorghum hay is good, but it lacks that important thing, protein, even more than does corn fodder.

Legislating Against Oleomargarine and "Filled" Cheese.

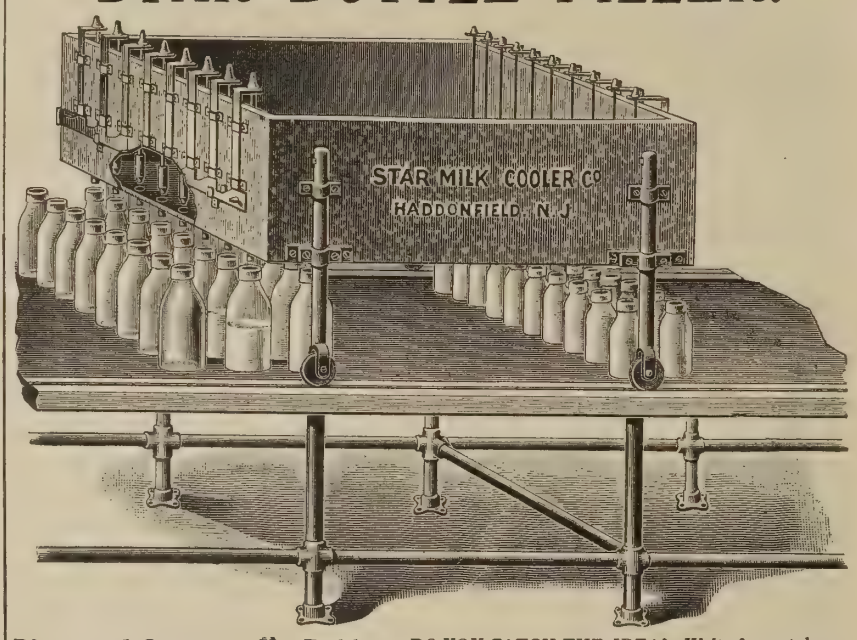
The article below was taken from the *Breeders' Gazette*, written by a correspondent in the state of Washington:



"A few years ago the state of Washington was flooded with oleo and filled cheese, and the dairy industry of the state was in a precarious condition; but within the past four years, a few dairymen, not more than ten or twelve at the start, got together and formed a State Dairymen's Association. They formulated a dairy law and fought it through the Legislature. A State Dairy Commissioner was appointed. When the prosecuting attorney of a leading county of the state virtually refused to prosecute a flagrant violation of the dairy law, this same little organization of dairymen passed a resolution denouncing in unmeasured terms the dilatory official. This resolution was couched in no unmeaning phrase. It specified the man who was denounced and it demanded an immediate prosecution of the case. The press, without which nothing could have been done, spread the resolution all over the state. The offending official was brought up with a jerk. The case was pushed vigorously. Special legal assistance was sought and was paid for by subscriptions from the dairymen of the state.

The defendant put up the plea that the yellow color of the oleo was its natural color, but the judge, who had recognized the importance to him personally of giving the case proper attention, gave the jury very plain instructions. He told them the question was not whether the oleo contained foreign coloring matter, but whether it looked like butter. The defendant admitted having sold it. The dairymen won. To-day the dairy industry of the state is in a flourishing condition. Very little adulterated butter or cheese is sold in the state; I should say no filled cheese and little oleo, the latter being sold in compliance with the law."

A year or more ago it was stated in the public prints that six tons of oleomargarine were sold monthly in the city of Birmingham, Ala. Possibly the figures were exaggerated, but there is no doubt but that immense quantities were sold. The local dairymen of the county organized and made war against the sale of this counterfeit butter, and they were rewarded with success. Oleomargarine was almost entirely run out of the market.



In the state of Mississippi, immense quantities of oleomargarine are sold every day in the year. We have in the state no law regulating its sale, as in the dairy states of the north. Many efforts have been made to induce our legislatures to pass bills to check the evil, and to give relief and protection to the dairy interests proper, but without avail.

The influence of the cotton seed oil mill interests is a gigantic power in Mississippi, and it is through this trust, which is in full sympathy with the manufacturers of oleo and compound lard, will continue to control our state legislatures for a long time to come—until the dairymen organize and press the needful legislation.—*The Southern Dairyman.*

I deliver free on board at New York, Chicago, Columbus, O., Louisville, Ky., Minneapolis, San Francisco and other points

Address DUANE H. NASH, Sole Mfr., MILLINGTON, N. J., or CHICAGO, ILL.

PLEASE MENTION THIS PAPER.

THE FAMOUS KEYSTONE LINE OF SEEDING, PLANTING AND CULTIVATING TOOLS.

Victor Disc Harrow —greatly improved for '99. Oil tubes to the bearings from top of frame—positively exclude all dust or dirt. Steel scrapers, double adjustment levers—easy to place gangs at any angle. Ball bearing—no side pressure and easy draft. Made 4, 5, 6, 7 and 8 ft. wide, with 18 or 20 in. discs. SEEDER ATTACHMENTS are made for 6, 7 and 8 ft. disc harrows.

Keystone Force Feed Broadcast Seeder are made 8½ or 11 ft. wide. Sows broadcast all small grains in any quantity in the best possible manner. Mounted on low steel wheels. Made with or without grass seed attachment. Equipped with CULTIVATOR ATTACHMENT if ordered. Made with end wheels or middle wheels. Has the best force feed we know. Send for special Seed Circulars.

Keystone Rotary Drop Corn Planter —it's a whole hill drop, each hole in seed plate holds enough grain for a hill. It never skips or misses. Equipped with Automatic Wire Reel. Has a drill attachment. Gear throws out automatically at end of row. Always drops at even depth because of the shoe gage on each runner.

Keystone Potato Planter —sprung quickly into popular favor because it is a simple and effective machine for the purpose at a reasonable price. Fits the needs of the man who grows an acre or two of potatoes, but who is not regularly in the business. Plants 10, 14, 17 or 20 inches apart in rows. Send for circulars.

Keystone Walking Cultivator. This is clearly a leader among the machines of its class. It is made entirely of steel and iron except tongue, singletrees and neck yoke. Strong and well braced in every way. Steel braces and four soft center steel shovels. Full line of Riding Cultivators also. Send for circulars.

KEYSTONE MANUFACTURING CO., 39 RIVER STREET, STERLING, ILLINOIS.

The Anti-friction Four Burr MOGUL

Will Actually Grind 60 to 80 Bushels per hour Has four burrs nearly three feet in diameter grinding at once. Grinds **Four Times as Fast** as other mills; has no friction; all the pressure is on the grain. No gearing, no oil needed, and the lightest draft known. We manufacture the largest and best line of Feed Mills sold, including the famous Iowa Mill No. 2, for $13. Agents wanted. IOWA GRINDER AND STEAMER WORKS, Waterloo, Ia.

Be Fair with Your Fields

and they will be fair with you..... Listen a moment.

Every time you take a crop off a field you relieve it of just so much fertility. You should do something to restore that fertility. Barn yard manure is the best fertility restorative known if properly handled and properly applied. Even a small amount can be made to go a long way and accomplish great good if finely and evenly spread. This cannot be successfully done by hand—it is work for a perfected machine. The only machine known which accomplishes this is

The KEMP MANURE SPREADER.

It will Double and Treble the Value of the Manure Heap.

It spreads all kinds of **fine and coarse manure evenly;** it makes no "skips;" does not dump a great load in one spot, but covers the entire ground evenly. Tears up coarse and lumpy manure and makes it fine. Better than anybody can do it by hand. **Spreads lime, wood ashes, salt, etc.,** equally well. With the drill attachment **it puts the manure direct into the open drill.** Made in three convenient sizes. Ask the opinion of anybody that uses one. **Write for illustrated catalogue.**

Kemp & Burpee Mfg. Co., Box 46, Syracuse, N. Y.

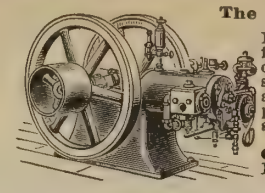
DO YOUR OWN... GRINDING

With one of our **FARMER'S FRIEND Sweep Feed Mills,** and save cost of hauling. It has adjustable force feed, steel ball bearings, burrs 30 in. diameter and self-sharpening. **We make Well-Drilling Machinery.**

KELLY & TANEYHILL, Waterloo, Ia.

THE CROWN POINT GRINDING MILL,

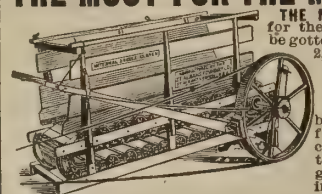
With the Letz patent burrs, that don't dull when running empty. Grind all grain, damp or dry, as fine as desired, the oats so fine that it can be fed to pigs. Grind with less power than others, as they are made with roller bearing. A boy can operate them. Make no mistake—buy the best. Send for catalogue.



CROWN POINT MFG. CO., Crown Point, Ind.

KELLY DUPLEX GRINDING MILL

is made to grind all kinds of grain, cotton seed, corn and cob, shucked or unshucked, into coarse, medium or fine grist. Does it rapidly, cheaply, and with small power. Only mill made with **DUPLEX GRINDERS.** Don't buy a grinder until you get our free Catalogue, No. 16.



O. S. Kelly Co. Springfield, O.

The Lambert Is a success at grinding feed, cutting fodder, churning butter, separating cream, anything, it's so simple. Write for catalogue, prices, etc.

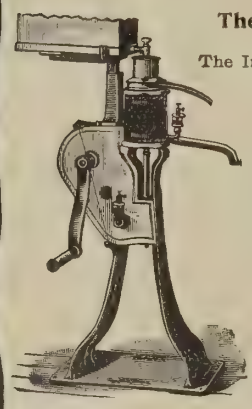
FACTS, NOT FICTION,



ABOUT

The Improved U. S. Triple Current Separators

They are the cleanest Skimmers on the market, as witness the reports from the State Experiment Stations and users the country over. They are also noted for their simplicity, ease of operation and durability.

A Few 1899 Experiment Station Reports.

Massachusetts,	average of 19 tests,	January 7th to 31st,	.033 of 1%
Ohio,	" " 19 "	" 10th to 21st,	.034 of 1%
Vermont,	" " 18 "	" 9th to Feb. 3d,	.038 of 1%
Wisconsin,	" " 17 "	" 2d to 19th,	.03 of 1%
An average from 73 tests of skim milk of			.034 of 1%

The U. S. Excels in Every Particular

FORESTVILLE, CONN., Feb. 18th, 1899.

The Improved U. S. Separator is giving excellent satisfaction. In comparing it with other makes, have found it to far excel in every particular—in thoroughness of skimming, ease of operation, design and finish, simplicity of construction, therefore easy to clean, and durability. Any one contemplating buying a Separator should investigate the merits of the Improved U. S.

WILLIAM F. KENNEY,
Buttermaker for J. Hart Welch.

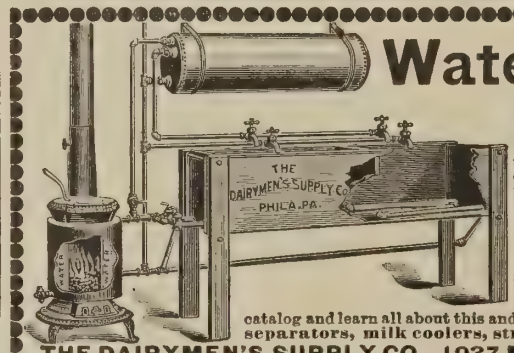
The U. S. the Best on the Market

DEER PARK, MO., Feb. 25th, 1899.

The butter I exhibited at the St. Louis Fair scored 98½ points and won the Sweepstakes over the creamery butter from several of the best Creameries in the United States. It was made from cream separated by the No. 5 Improved U. S. Separator I have been using for nearly three years, which has always been in running order and given entire satisfaction. If I had to buy another it would be an Improved U. S., for I think it the best on the market.

NATHAN KING.

No Loss of Cream in the Skim Milk



BROMPTON FALLS, P. Q., Jan. 31st, 1899.

The No. 1 and No. 0 Improved U. S. Separators purchased last spring are giving perfect satisfaction. They run smoothly and easily and take all the cream out of the milk. They are simple, durable, and not liable to get out of order.

Subscriptions in United States and Canada $1.00 per year; 6 months 50 cents; 3 months 25 cents.

Foreign Subscriptions may be sent through Sampson Low, Marston & Co., St Dunstan's House, Fetter Lane, London, Eng., or their agents, including the leading news dealers and book sellers in nearly all foreign countries.

All countries in the Postal Union $2.04 a year; not in the Postal Union $2.56.

Correspondents must not expect us to acknowledge the receipt of letters containing remittances for subscriptions. The receipt of the Dairyman is sufficient notification that the money has been received. The label on the paper will show date to which subscription is paid. In case of renewals if date on label is not changed within two weeks after remittance is sent, inform us at once.

Remit by draft on Chicago or New York, or Post Office or Express Order; never by personal check.

Reading notices, 50 cents per line (nonpariel measure) each insertion.

In some of the towns in Manitoba, Can., the local merchants are so opposed to the establishment of creameries that they paid 17 cents for dairy butter last season, which they sold again at 12 cents. Those merchants ought to travel a little, or write to some of the merchants in Iowa or Wisconsin. Ignorance has some very curious ways of manifesting itself.

Last year the New York Milk Trust paid the farmers $6,000,000 for milk, and received $18,000,000. With such outrageous profit it is no wonder that the farmers have organized under the name of the Five States Milk Producers Association, which now controls 20,000 of the 25,000 cans of milk which daily go into New York city. The Association has been offered 2½ cents per quart, by a syndicate, whereas the Trust has been paying them only 1⅝ cents. Farmers must recognize that the only way to fight the devil is with fire. Organize against organizations.

WHAT SORT OF BREEDERS WERE THEY?

The Holstein-Friesian Register of Feb., in giving an account of the late meeting of the Ayrshire breeders in New York, says:

"It was brought out in the discussion that the amount of butter fat in a cow's milk varies widely at various periods of lactation; and *this was news to even some of the older breeders present.*"

It may be hardly fair to hold the Ayrshire breeders responsible for what the organ of a rival breed says, but nevertheless we have no doubt that some of them were surprised.

There is hardly a farmer in the land but knows that as cows approach the close of their period of milk giving, their milk increases in the percentage of butter fat. And yet we have seen breeders of Jerseys, Guernseys and Holsteins who did not know this fact.

When men start out to breed dairy cattle it is presumed they breed them for dairy purposes. Such breeders ought to be well posted dairymen and thorough students of the cow from the dairy point of view. That they are not, is clearly shown in the senseless stand Jenkins of the *Jersey Bulletin* takes on the Babcock test. While yet there were hundreds of thousands of farmers who were receiving their dividends by the test, the whole reaching into millions of dollars, the *Bulletin* couldn't see it and can't see it yet. The Ayrshire men should take heart of courage.

A Wisconsin Dairy Barn.

Ed. Hoard's Dairyman:—Complying with your request, I send you a photograph and ground plan of my barn, which I built last summer.

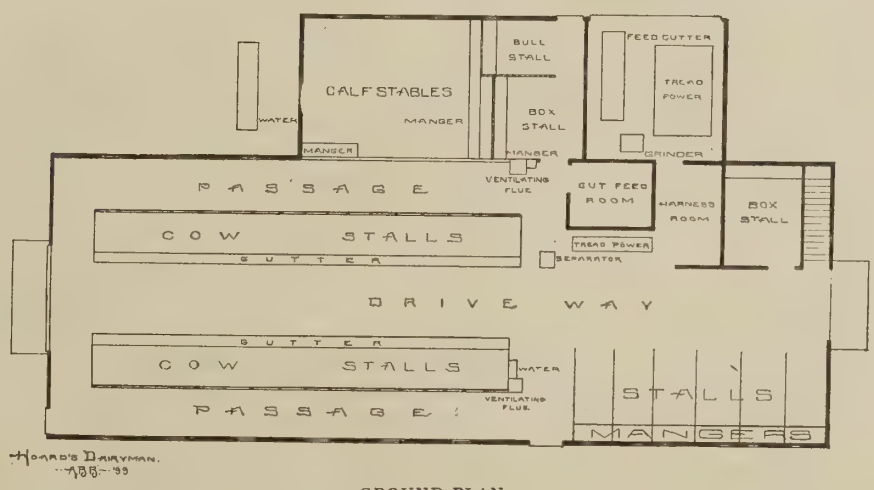
The size is 32 x 88 feet with 26 feet posts; also a leanto 16 x 48 feet. The first story is eight feet in the clear, and is used for stables, etc., as shown in the plan. The upper story is used for hay and fodder, except two feed bins 10 x 10 x 12 feet, each one on each side of the place where we drive in to unload hay, etc. Also water tank in loft 6 x 6 feet, holding about thirty-five barrels.

To unload the hay, we drive into the door shown at the end of the barn, and the hay is elevated to the track at the top of the barn, which carries it where wanted. We use a floor up through the roof. There are two of these, one on each side of the barn.

In regard to cost, it is as follows:

Lumber	$950.00
Hardware	175.00
Labor of carpenters, masons and painters	400.00
Total	$1,525.00

This includes board of carpenters, etc., but does not count my work or team work and work of hired man hauling lumber, stone, sand, etc.



C. I. Morrison.

Jefferson County, Wis.

C. I. MORRISON'S DAIRY BARN.

Near Fort Atkinson, Wis.

GROUND PLAN.

returner on the car, which, as the load is discharged brings fork back to the load, without the hard work of the old way.

The space where we drive in with load is raised even with top of door 13 x 18 feet, which space is covered with trap doors when not in use.

The frame of the barn is a combination of the plank and large timber frame. Barn is covered with drop siding and lower story is lined with building paper and matched lumber. The doors are made double and the one shown at the end of barn, 12 x 13 feet, has an inside door hung on pulleys and balanced by two weights which raises door out of way when not in use.

In ventilating the stable, we have six openings seven inches square, three on each side of barn, about half way from floor to ceiling of stable. These open into flues 6 x 8 inches square, made of boards, which run to within six inches of ceiling. This carries the fresh air into the top of stable and prevents draft on the animals, also prevents the warmer air near the top from passing down and out of these openings.

The outlets for the foul air are twenty inches in diameter and run from near the

Succulent Feeds.

Sowing Oats and Peas.

Ed. Hoard's Dairyman:—Much has been said each season regarding the various kinds of soiling crops, but just as the shrewd farmer has an eye to the importance of some succulent feeds with which to carry his stock through the long, cold months, so common in these latitudes, so he ought equally to think of the long and protracted drouths which come with almost as much certainty as taxes.

Not long since, when in conversation with a prominent Canadian, relative to stock matters, he made this remark which impressed me very much. "The percentage of accidents or trouble experienced in various ways in relation to carrying stock through the winter season in our country (Canada), I believe to be much less than with you, particularly in relation to breeding animals." The gist of the whole deal is this:

While we are a corn producing people, and it is one of our strongest crops in a financial way, it is a fact that the abuse of, and not the use of corn in proper rations that causes serious trouble; while with our neighbors across the border are not privileged to produce corn largely, so are obliged to do the next best thing—which is to grow roots very extensively, and with this stock of succulent feed on hand, the whole matter is resolved into a simple problem, that of keeping breeding animals in a thrifty condition, with far less danger attended than when such carbonaceous foods are depended upon.

Not alone need this succulent feed be confined to the use of roots, but a liberal allowance of good bran is proving a boon to many a feeder. Many who have a surplus of timothy or blue grass hay are fast learning to exchange the same and make use of the last named feed, as amuch greater feeding value is obtained and at the same time more than double the manurial value, a prominent phase of the subject which should be considered when purchasing feed stuffs.

This succulent and profitable feed for the summer months should receive as much attention as the winter; because unless milkers are carried with a good flow through the drouth, a shrinkage is sure to follow which is hard or next to impossible to overcome later on. To those not using the summer silo, or depending too largely and unprofitably on pasture, we would advise sowing oats and peas. To grow this crop with the greatest profit, there is something to be learned usually, from observation in any section. Not one-half of bulk is grown that may be grown if land be liberally manured or otherwise enriched.

Next of importance is the early sowing. Choose an early site, if possible, plow and fit, just as soon as land is fittable, and a good, fine texture can be made.

Now for the seeding, and mighty little is generally sown. As to the possibilities of this crop, ignorance might have been bliss in my case still, had I not tumbled on to the truth, coming as nearly as all good things do, by accident.

With good, sharp drill points, weighted down with a large fence post over arms in front, you can place peas in the ground at an average of four inches.

Use two bushels of small field peas to the acre, wait one week or there abouts, depending somewhat as to how warm the weather is, then proceed and sow three bushels of good, clean oats to the acre. Harrow in well, with light weight harrow, and if season is running dry roll down immediately.

This plan we have been working on, and find that this one cutting will give us more feeding value and bulk than any other crop on earth, corn or alfalfa not excepted.

We also found after taking this enormous crop off the ground and from this heavy seeding, that our wheat showed up better from start to finish than under precisely the same conditions on land adjoining from which a crop of oats of 50 bu. has been harvested from two and one-half bushels seeding.

Note the eyeopener, leguminous plants. C. H. Whitcomb.

Niagara Co, N. Y.

In Regard to Cow Peas.

Ed. Hoard's Dairyman:—A subscriber from Southern Michigan wants to know about what variety of cow peas are the best. I would just as lieve answer what kind of pie I like best; they are all good. There are three kinds that come to the Baltimore market—a black pea with a white eye, a white pea with a black eye, and a clay pea. One year we tried all three kinds, side by side, and there was little difference, but still a little in favor of the black pea, and since we have stuck to the black.

How much of a crop they would make in Michigan I don't know, but here in Maryland I have seen them ripen a crop, and then when plowed under, the seed would make plants six or more inches high before frost touched them; so they can go a good bit further north. But remember that they are a bean, and do not plant too soon. In Virginia, their home, the farmers have a saying: "Plant peas every Saturday in May, and you will have peas to give away." P. B. Crosby.

THE Supervising Committee of the experiment Farm at Southern Pines, N. C., have just issued a very valuable and important work on "Plant Food." The book is well printed and handsomely illustrated with many fine pictures. It would pay farmers to read this book, which, we understand can be obtained free by sending to the Director.—Experiment Farm, Southern Pines, N. C.

AN IMPORTANT QUESTION.

The creameries in Chester and Delaware counties, Pennsylvania, have done an admirable thing in organizing an association which meets regularly for the discussion of important topics, and especially for the promotion of right ideas of dairy management, among the farmers who are their patrons. There is sound sense in such a move, and much stimulus will be imparted by it to the patrons along the way of a better knowledge of dairy methods. At a recent meeting, the association discussed "the best method of disposing of the skim milk."

That this is a rich field for all dairymen to explore will be seen, when we state that in ordinary creamery work among average patrons there is a difference of from 10 to 15 cents a hundred in the return that is obtained from feeding skim milk.

This difference is in feeding to hogs alone, and is due to the difference in intelligence on this question among the patrons. In other words one patron will get from his skim milk 10 cents a hundred more than another when both feed it to hogs, and where it comes alike to both from the creamery. When fine grade heifer calves, with a registered sire, are fed with the milk, the profit is more than double than when fed to pigs. But this difference is not due to the patrons as in the other case.

It is difficult to get the average farmer to look into this question, and see for himself what a fearful waste of good money runs away, because he lacks good judgment on the skim milk question.

Every county where there are four or more creameries or cheese factories should organize an association for the purpose of educating the patrons to a better knowledge of dairy principles. The point is to get them to see where they are throwing time, labor and hard earned money away, right at the farm end of the business. It is greatly to the interest of both creamery and patron that this be done.

But few, comparatively, of the farmers of the country who send their milk to factories or creameries read dairy papers or put themselves in any current where these important economical questions are discussed.

The tendency of the creamery and factory is to make the patron indifferent to his own dairy education. He gets into the habit of measuring himself by the general average, not thinking that the bigger profit to him will come from being above the average. Before there was a creamery in Jefferson Co., Wis., there were about 1,500 farmers who made butter and consigned it to Chicago and other cities. They came sharply in contact with the merciless education of the market, and it made them keen to know everything they could that would help them make more out of their cows. There was much more study of the science of feeding, much more reading up on the questions of dairy breeding, and those especial questions which belong to the management of cows than there is to-day. The reason was that every man stood by himself, alone. He made his own butter and sold it, and he could see how the character of his cows, his manner of stabling, the way he fed, the kind of feed, in short the kind of a dairyman he was, all affected the returns he got.

All these things affect the creamery patron to-day just as they did when he was a private dairyman, but he don't see it. His mind is on the creamery, and he loses sight of how his own growth in dairy knowledge, and the many things that make up the dollar of profit to him at the farm end.

There is only one way that we can perceive that will make a large proportion of the patrons see the necessity of better dairy methods on the farm, that will induce them to take more interest in their own growth in dairy knowledge. That is, as we have said, for the creameries to form county associations for the discussion of live topics. The creameries must lead, but they must make the organization of large benefit to the patron.

Too many creamerymen and factorymen look with suspicion on every effort to enlighten their patrons. They are greatly mistaken in this view. It ought to be their constant effort, if they are wise unto their own success, to help the patron make every dollar he can out of his cows. But to do this, he must have right ideas about everything that affects that dollar. The use of the skim milk is an important item, but it is only one of many.

The patrons surely need better dairy education. Many will not spend a cent or an hour's time to get it. But their lack of it tells on their success, and that of the creamery or factory just the same. We believe well organized effort by counties will help increase the profit of both patrons and creameries or factories very greatly.

Calf Scours.

ED HOARD'S DAIRYMAN:—Would like to say one word in regard to calf scours. Have tried several different treatments but without success. I finally commenced using castor oil, four tablespoonfuls at a dose, and have never lost a calf that I treated that way. E. E. W., Ill.

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name, Post-office and state of writer. Condense the questions into plain specific inquiry. Be careful to note if your questions have not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

GLOSSARY.

The terms used in this department of HOARD'S DAIRYMAN have the following significance:

RATION.—The total allowance of feed for twenty-four hours.

DIGESTIBLE NUTRIENTS.—That portion of the organic matter which can be digested by the animal and does not pass off through the bowels as excrement.

PROTEIN.—That part of the digestible nutrients which goes to the formation of lean meat, ligaments, hair, horns and the casein (or curd) of milk. It is generally believed, also, that protein may be, and many times is, converted into the fat found in milk. The basis of protein is nitrogen, hence the protein elements are frequently termed the *nitrogenous* parts of the food. They are also called *albuminoids*.

CARBOHYDRATES.—That part of the digestible nutrients which is the primary source of sustaining animal heat and furnishing the power for keeping the animal mechanism in operation. They are composed of the woody fibre of the plant and grain, and the starch, sugar, gums, etc, and in the published tables of chemical analyses are usually subdivided into the terms *crude fibre*, which is the least digestible portion of feeding stuffs and *nitrogen free-extract*, so-called because it does not contain any nitrogen.

ETHER EXTRACT.—That portion of the digestible nutrients which may be dissolved out of the food stuffs by ether. It is frequently called *crude fat*. Whether fat is actually digested and thus passed on into the circulatory system in a changed form, or whether it is simply separated from the other elements and always maintains its identity is an unsettled problem. It can be used by the animal for maintaining the body temperature, and for this purpose is from 2.2 to 2.5 times more efficacious than the carbohydrates. It is maintained, by some, that the fat in the milk comes, largely, from the crude fat in the food, but it has been demonstrated that it is not absolutely necessary for this purpose.

FEEDING STANDARDS FOR MILCH COWS.

Dry matter.	DIGESTIBLE NUTRIENTS *Protein*	*Carbohydrates.*	*Ether extract.*
lbs.	lbs.	lbs.	lbs.
23 to 28	2.0 to 2.5	12. to 15.0	0.5 to 0.8

WHEN SHOULD MANURE BE DRAWN OUT AND SPREAD?

I plow manure under for corn. Which pays the best, to draw the manure out in the winter and spread it, or in the spring? In spreading manure on top, and leaving it three months before plowing it under, is there any goodness of the manure lost?

Brushton, N. Y. B. T.

It cannot be said that these questions have been definitely settled. Opinions differ very widely. Personally, we prefer to haul the manure directly from the stable and spread it. We do not think there is any appreciable loss, more especially if a little land plaster has been used in the stable to gather and hold the volatile ammonia. Certainly the loss in this way would be much less than letting it lie exposed in the open yard, as is the almost universal custom. Moreover, there is a saving of time and labor that will compensate for such losses as may occur, as it avoids one extra handling, and sensibly relieves the pressure of work in the spring.

A WISCONSIN RATION.

I would like a balanced ration from the following feeds: Cut corn stalks, clover hay; bran, $14 per ton; shorts, $14; fine middlings, $14.50; shelled corn, 38 cents a bushel; oil meal, $24 per ton.

We are now feeding per day in two feeds, 12 pounds cut corn stalks, 5 pounds bran, 7½ pounds corn meal, ¾ pound oil meal, with, at noon, what clover hay they will eat clean. Results from 74 to 77 pounds of butter per week from eleven cows.

Waukesha Co., Wis. C. S. L.

We do not see how the composition of this ration can be improved. As a matter of practice, we should omit the noon foddering next year. Cows need feeding at midnight as much as at noon.

FOR WISCONSIN SHORT-HORNS.

Please give me a balanced ration of the following feeds: Clover hay $6 per ton, corn stover, fodder corn, ground oats $20 per ton, wheat bran $15 per ton, corn and cob meal $11 per ton, linseed meal (old process) $1.50 per cwt. Cows mostly Short-horns, weighing about 1,100 pounds. Receive 20 cents per pound for butter the year round.

Waukesha Co., Wis. R. K.

Clover hay being much the cheapest of the feeds mentioned where prices are given, the cows should have a full allowance of this, rather than be crowded to eat the stover and fodder corn and buy bran or other protein feed to balance. We therefore suggest as follows:

FORMULA FOR RATION.	*Dry Matter.*	*Digestible Nutrients* Protein.	Carbohydrates	Ether Extract
20 lbs. clover hay	16.94	1 36	7.16	.34
8 lbs corn and cob meal	7.12	.51	5.04	28
1½ lbs. oil meal	1.36	44	.49	.11
Totals	25.42	2.31	12.69	.73

Give all the fodder and stover in addition that any cow will eat, and do not neglect regular salting.

FEEDING TURNIPS TO CALVES.

I find that calves from two to three months old are very fond of turnips. I make them fine with a root cutter. Do you think they will be harmful to feed these calves, say about one quart a day along with other feed.

Windon, Wis. M. S.

They are excellent feed if you will give sufficient other dry matter along with them to keep the calves growing. Remember that turnips are largely water and are low in protein. They should be fed as a relish and to give the calves the advantage of a succulent food.

CABBAGE AND CORN.

I have a dairy of fifteen cows and feed hay, ensilage made of the entire corn crop, and about eight pounds mixed grain a day to a cow. When marketing my cabbage this winter (which took about two months on account of cold weather), I fed the refuse from the cabbage to the cows in the place of ensilage. Usually it would last about three days at a time. I noticed that every time I made the change from ensilage to cabbage, the cows gained on their milk as much as one-half can a day, and fell back when I stopped. I noticed also that when fed on cabbage, they ate about as much again of hay.

I want to know what caused the change in the milk supply. Was it the cabbage, or was it because they ate more hay, or was it because the hay, cabbage and grain made a better balanced ration, or was the ensilage too sour? It looks like very fine ensilage.

Fabius, N. Y. G. H. G.

Cabbage contains from 50 to 100 per cent more protein than corn silage, and this fact may or may not explain the increase in milk. Cabbage, however, contains over 50 per cent less dry matter than corn silage, and is, therefore, deficient in carbohydrates and fat, and this is sufficient to account for the increased consumption of hay. The presumption is that there was too little protein in the ration when silage was fed.

FEEDING PRIOR TO FRESHENING.

Will you advise whether it is policy to feed more than 2 pounds bran and 2 pounds gluten meal to dry cows or heifers from six to eight weeks prior to calving? They would have all the hay and cut corn stover they could eat in addition. Also, advise whether they should not have, at least, from two to four hours exercise in an open lot on bright, clear days when so near calving? Our cattle have been well fed on a balanced ration, and the dry ones as well as the heifers have had as much as the fresh ones, resulting in their getting in a fat condition, and have been watered in the barn; no exercise. It seems we have no end of inflamed bags and trouble when our cows come in, and have lost one of our best pure breds. D. W. D.

Reading, Pa.

So far as the cows are concerned, if in good order, they will need little or no grain at such a time. We are not advocates of the "starvation theory" by any means, but at the same time plethora and a stimulated condition of the system are the active advance agents for milk fever. Bring about, as near as may be, a normal condition of all the bodily functions. This can, ordinarily, be done by attention to feeding. Often all that will be required is a warm "bran mash" properly salted. If this does not suffice, add some oil meal, and, in obstinate cases, laxative doses of salts. We do not practice ac-

tive purgation, and can see no justification therefor in any ordinary case.

Heifers, about to drop their first calves, should be fed rather more than generously, in order to develop their udders as much as possible. There is no danger of milk fever with them, and with proper care the greatly enlarged udder comes down to its proper size without serious trouble.

Exercise is of great importance, but may be carried to excess, especially if it subjects the expectant mother to ill usage by other cattle, or exposure to cold or storms.

SOILING CROPS.

1. What are the best crops for soiling?
2. When and how planted?
3. What is the best way to cut and handle it, *i. e.* what machinery is necessary?

Those having small farms will have to come to the soiling system, as land at $75 an acre is too expensive for pasture. An extensive and comprehensive view of the subject would be very instructive. Let us hear from many. F. S. HAUPT.

Minnesota.

The following table, taken from "Feeds and Feeding," and originally compiled by the Hatch Experiment Station of Massachusetts, gives crops and areas, which will be found necessary for a herd of ten cows, during the entire summer. It is easily seen that no one machine or method can be employed to handle such a diversified series of green feeds.

CROPS AND AREAS FOR SAME, FOR SOILING TEN COWS DURING THE ENTIRE SUMMER.

Crop.	*Seed per acre.*	*Time of seeding*	*Area.*	*Time of cutting.*
Rye	2 bushels	Sept. 10-15	½ acre	May 20—May 30
Wheat	2 bushels	Sept. 10-15	¼ acre	June 1—June 15
Red clover	20 pounds	July 15 Aug. 1	½ acre	June 15—June 30
Grass and clover	½ bu red top ¼ bu. timothy 10 lbs red clover	September	⅔ acre	June 15 June 30
Vetch and oats	3 bu oats 50 lbs. vetch	April 20	⅓ acre	June 25—July 10
Vetch and oats	50 lbs. vetch	April 30	⅓ acre	July 10—July 20
Peas and oats	½ bu. Canada ½ bu. oats	April 20	⅓ acre	June 25—July 10
Peas and oats	1½ bu. Canada 1½ bu. oats	April 30	⅓ acre	July 10—July 20
Barnyard millet	1 peck	May 10	⅓ acre	July 25 Aug. 20
Barnyard millet	1 peck	May 25	⅓ acre	Aug 10—Aug. 20
Soja bean	18 quarts	May 10	⅓ acre	Aug. 25—Sept. 15
Corn		May 20	⅓ acre	Aug 25—Sept. 10
Corn		May 30	⅓ acre	Sept. 10—Sept. 20
Hungarian	1 bushel	July 15	⅓ acre	Sept. 20—Sept 30
Barley and peas.	1½ bu. each	Aug. 5	1 acre	Oct. 1—Oct 20

Some two years ago we published a paper on "Soiling," read before a farmers' institute in Ohio, by D. C. Long, from which we copy several of the more important passages, as follows:

There is a long list of the so-called forage crops, but will only speak of those we have grown. Winter rye comes earliest in spring. If sown early in September will usually be ready to feed by April 1st. Prefer sowing rye broadcast at the rate of two bushels to the acre; grows a finer stalk and is more readily eaten. Sow again in October, usually after late potatoes; ground can be easily fitted with disk or cultivator. Harrow in rye and at the same time getting any potatoes that have been missed.

Crimson clover promises fair to fill a space here between rye and our common red clover. Have only sowed the crimson two seasons, but am inclined to think very favorably of it. The period when it is at its best, however, is comparatively short, but is fully three weeks earlier than the red clover. The common red clover is so well and favorably known, that it hardly seems necessary for me to speak of this. Usually two crops of this are cut from the same ground and in a season like the past one a very fair third crop could have been cut.

After clover, oats and peas are fed. Sow as early as possible in spring. Have tried different ways of sowing. Prefer plowing the ground, sowing peas at the rate of two bushels to the acre, broadcast, then harrow and fit the ground and drill in oats, two bushels to the acre, and roll in order to have a smooth, even surface. Two or three plats of oats and peas are sown at intervals of two weeks apart. Millet and Hungarian can also be sown and is usually ready to feed before the early planting of sweet corn, which should not be planted until the ground is warm.

Have tried different varieties of sweet corn, but none of them afford as much feed as Stowell's Evergreen. Last season three different plats were planted at intervals of ten days. Have had good success drilling in corn with grain drill by removing every alternate shovel and shutting off the feed by a circular tin cut to fit, which leaves the drills or rows sixteen inches apart. Just before the corn comes up, harrow thoroughly, and again after corn is three or four inches high, using a slant tooth harrow. If care is taken, horses may be made to walk between rows, and very little corn will be trampled. More quantity can be grown from a given area by sowing thick, but will be at the expense of quality. By using a liberal amount of barnyard manure, and if the work has been well done, you will not have any weeds and the corn needs no further attention. Have also planted the common field corn in the same way. Ensilage corn is also grown for late feed, but is drilled in rows three feet apart.

For convenience in cutting, all soiling crops are planted in long narrow plats, as all are cut with the mower, hand cutting being too slow and tedious.

Each day's feed is cut as early in the morning as convenient and while the dew is on, as it keeps more fresh than if cut in the heat of the day, excepting, however, we bring in enough the last thing Saturday evening for Sunday.

So far as can be done, we grow two crops from the same ground each season. For instance, after early plat of rye, oats and peas or sweet corn, and after first plat of oats and peas, millet or late corn, always aiming to manure each plat once a year.

Several years ago, three crops were grown from the same plat very successfully. Rye fed in April, followed with oats and peas, and again plowed and sown to millet, which was fed till frost came. What remained was cut and made into hay. The past year, ten cows were kept, producing 91,580 pounds of milk. The total area used for growing soiling crops did not exceed six acres.

LICENSING ENGINEERS.

J. H. H., of Westville, Indiana, asks us a series of questions about the licensing of engineers in different states, which we are unable to answer. We are of the opinion that very few states require engineers to take out license, and that there is little uniformity in the laws upon that subject. If it is desired to ascertain the special provisions, which obtain in some particular state, write to the attorney general of that state, for a copy of the law.

ACID WATER IN THE CREAMERY.

We have trouble with our creamery water. It is of a sulphur nature and it eats holes in the zinc, causing it to leak. We painted it with white lead and oil but water softens it and causes it to come off. L. S. C.

Shelbyville, Ill.

You will probably find it cheaper, in the long run, to change your water supply. The acid water could be corrected by the use of lime or other chemicals, but it would be considerable of a task, requiring special apparatus in the form of tanks, etc. If you can obtain your water supply from elsewhere it would be the easiest way out of the difficulty.

CHOOSING FEEDS.

With Chicago gluten feed at $21, best bran $18, cotton seed meal $23 per ton, which will produce the cheaper milk, the two former mixed half and half, or the latter, 2 to 4 pounds per day, with no bad effect to cows? Where manure is drawn directly from stable, all liquids saved by horse manure, used as an absorbent, how much would the value of same be enriched?

Fairland, N. Y. G. C. B.

Where all the feeds are so expensive, there is but little room for choice. Deducting the estimated available manurial values of these feeds, as given on page 84 *ante*, the feeding cost of bran would be $13.28; gluten feed $17.58; and cotton seed meal $14 64 Charging all this cost to the digestible protein in each, it would make the protein in bran cost 5.67 cents per pound; in gluten feed 4 2 cents; in cotton seed meal a fraction less than 2 cents. Unfortunately there is a limit to the amount of cotton seed meal that can be safely fed, having regard as well to the quality of the product as to the health of the animal. This limit may vary with different animals, but we place it at 2 pounds per day for an average, and then want it mixed with an equal amount of bran or some other light material to dilute and extend it. Ordinarily, bran is the best material for this purpose, but silage or any other cut feed (hay, straw or stover) will answer. Dried brewers grains, malt sprouts, oat dust, anything that is bulky, would do very well.

The following combinations of different feed stuffs would have approximately equal feeding value :

Cotton seed meal	2 lbs.	2 lbs	2 lbs.	2 lbs	2 lbs.
Corn and cob meal	4 lbs	4 lbs.		2 lbs.	
Brewers grains(dry)	4 lbs		4 lbs		
Bran		5 lbs.	2 lbs		2 lbs.
Gluten feed				4 lbs.	3 lbs

The second query is answered as fully as practicable on page 84.

SILAGE FOR STEERS.—EXPLANATION OF ANALYSES.

I would like for you to answer in your next issue the value of silage as feed for steers, that is, is it as good a feed as one can feed with the addition of corn meal, and will it pay to feed to steers?

I also notice in your paper where you advise feeding a balanced ration where 4 lbs. bran is equal to 3.52 dry matter, .50 protein, 1.54 carbohydrates and .12 ether extract. You certainly don't mean pounds and parts of same, and, if not, what do you mean?

This is my second year for the DAIRYMAN and I am better pleased with it every week.

Lima, Ind. G. W. D.

There is no question as to availability of silage as a part of the feed for fattening steers. In the earlier part of the feeding period, Prof. Henry says, as much as 40 to 50 lbs. may be fed daily, but when on full-grain allowance this amount should be reduced about one-half. Silage, like roots, tends to keep the system cool and the appetite vigorous, by aiding digestion, and withal is cheaper and more convenient to handle than roots. For best results some dry forage should be fed each day, and the corn meal should be mixed with a part of the silage.

The analyses of feeding stuffs as published show, for example, that there are 3.52 lbs. of dry matter in 4 lbs. of bran, and that this dry matter contains .50 of a pound of digestible protein, 1.54 lbs. of digestible carbohydrates and .12 of a pound of digestible ether extract or crude fat. In other words, there are in 4 lbs. of bran 2.16 lbs. digestible nutrients, 1.36 lbs. indigestible fiber, ash, etc., and .48 of a pound of water.

NOT ENOUGH PROTEIN.

Please give your opinion of following ration for 1,100-lb. cows: 60 lbs. ensilage (ear corn cut with it averaging about 3 bushels to ton), 8 lbs. wheat bran, all the corn stover they will eat during day. Cows in fine condition but not yielding much milk.

Rapidan, Va. J. W.

In addition to the silage and bran specified above, these 1,100-lb. cows will probably eat about 10 lbs. of the corn stover. Such a ration would tabulate as follows:

	Dry Matter.	*Digestible Nutrients*		
		Protein.	Carbohydrates	Ether Extract
60 lbs. silage	12.54	.54	6.78	.42
10 lbs. stover	5.95	17	3.24	.07
8 lbs. bran	6.85	1.00	3.09	.24
Totals	25.34	1.71	13.11	.73

The one element in feed without which milk cannot be made, is protein. Neither carbohydrates nor fat can be changed into casein, and without casein there cannot be milk. Protein also makes the lean meat, the muscles, the tendons, hair, etc. It has not been definitely determined as yet just how little protein in the feed will suffice for the milch cow in full flow of milk, but so far as experience has gone, it indicates that this minimum is about 2 lbs., and more rather than less. A goodly number of investigators place it at 2½ lbs.

This suggests the addition of some cotton seed meal to the above formula—say ½ lb. per day for the first week, a full pound for the second week, 1½ lbs. the third week and 2 lbs. the fourth week. After this it may be practicable to decrease the allowance of bran somewhat.

A MARYLAND RATION.

Please send ration for grade Jerseys, about 1,000 lbs., from following: Corn and cob meal $17 per ton, wheat bran $17 per ton, cotton seed meal $23 per ton. I am feeding clover hay in rack, and rough fodder in yard once a day. Also formulate ration for summer feeding. Pasture natural grass; run meadows. E. E. S.

Baltimore Co., Md.

At the prices named, we cannot advise the use of corn and cob meal, unless the price of hay is abnormally high. Clover hay at $10 per ton is as cheap as corn and cob meal at $17. There is more nutriment in a ton of corn and cob meal than in a ton of bran, but the bran contains twice as much protein. Bran at $17 is expensive feed, and we should be disposed to try the market for something cheaper, like brewers grains, or something of that kind. However, complying with our correspondent's request, we submit a formula, containing the feeds named, as follows:

FORMULA FOR RATION.	*Dry Matter.*	*Digestible Nutrients*		
		Protein.	Carbohydrates	Ether Extract
10 lbs. clover hay	8.47	.68	3.58	.17
10 lbs. corn stover	5.95	17	3.24	.07
4 lbs. bran	3.52	.50	1.54	.12
4 lb corn and cob meal	3.56	.26	2.52	.14
2 lbs. cotton seed meal	1.84	.74	.34	.18
Totals	23.54	2.35	11.22	.68

It is impracticable to give a formula for summer feeding on pasture, because one cannot tell how much the cows can get from grazing. With good pasture, very little grain will suffice, but as pasturing declines, grain must increase. Watch for results and feed accordingly.

STABLE FIXTURES AND ARRANGEMENTS.

1. What kind of stall arrangement is considered the best?
2. What is the best arrangement for fastening dairy animals?
3. Is it advisable to use iron feeding boxes for feeding concentrated feed to dairy animals?
4. What mangers are considered the best?
5. Where should a silo be located?
6. What has been the experience with stave silos? W. P.

Woodbine, N. J.

Questions one and two have been answered to the best of our ability over and over again. No man is justified in saying that any specific stall arrangement or method of fastening is the best. There are many good ones.

The writer of this reply discarded feeding boxes and mangers of every description years ago, but he does not expect this to become the common custom. Where a feed box of any description is used it should be large, water tight and have no sharp or small corners. There is perhaps no valid objection to using iron for this purpose, but personally we should prefer something different.

A silo should be located with regard to greatest convenience in feeding, and this would vary with the infinite variation in the plan of the barn and the arrangements of the stables.

Stave silos are evidently growing in favor.

A CALIFORNIA RATION.

We are feeding at present alfalfa hay 20 pounds, oil cake 2 pounds, bran 4½ pounds, corn 4½ pounds (shelled corn ground, called here feed meal) oil cake $45, bran $23, feed meal $25. We must have a ration that pr-

duces the maximum amount of milk, even though it be not the cheapest, because if we do not get the required amount of milk, we shall have to buy it. M. S. N.

Santa Ana, Cal.

This appears to us an unnecessarily large ration, but the experience of M. S. N. may justify it. We certainly should try reducing the oil cake to one pound, and use more of the feed meal, (say one pound) and reduce the bran to 3 pounds. If some portion of the alfalfa could be cut quite fine (chopped), we should try to dispense with bran altogether. The 20 pounds of alfalfa hay, a part of it chopped as above, and mixed with 8 pounds ground corn, and enough oil cake added to keep the bowels in proper condition, would make a better ration theoretically than the one now fed.

LIMITATIONS IN FEEDING MALT SPROUTS.

In reply to A. McG., Claude, Ontario: We recommend limiting the amount of malt sprouts to not more than three pounds per day, because experience has shown that this is as much as most cows will eat from day to day. Cattle seem to grow tired of them and "go off their feed" when the malt sprouts are fed in excess or constitute too large a proportion of the ration. They are not thought to be otherwise injurious.

CHEMICAL DEHORING.

I have seen somewhere advertised some stuff to keep the horns from growing on calves. Was the stuff advertised in your columns? Is it all right to use? If so, where can I get it? I have eight yearlings. Will this stuff take off their horns, or will I have to dehorn them. O. H. M.

Du Page Co., Ill.

The "stuff" referred to was advertised in this paper, and both effective and safe for the purpose. Write to John March Co., 58 River Street, Chicago, Ill.

Caustic potash may also be used. Wrap some paper around a piece of it to keep it from the fingers, moisten the end and rub on just at the top of the young horn button. Use as soon as the horns begin to show, and be careful not to get it on the surrounding flesh. Two applications may be necessary.

You will have to use a dehorner on the older animals.

AGE FOR DEHORNING.

Is it advisable to dehorn calves with caustic potash or wait until grown up and use dehorner? "S."

Long Green, Md.

The sooner it is done the better. As soon as the embryo horn appears as a small button, remove with potash or knife. The smaller the horn and consequent operation, the better.

PASTEURIZING MILK.

I am thinking of pasteurizing milk for city trade. Does the operation change the taste, looks or chemical analysis of the milk?

New York. T. M. D.

If the milk is handled as it should be, there would be no change in taste, looks or chemical analysis.

The only change is, that the cream does not rise so well. Be sure that you have your apparatus and milk in the best possible condition before you attempt to market your product.

HUSKING CORN AND THRESHING OATS.

S. H. of Eau Claire, Wis., writes that he has no silo, and asks whether it is better to feed fodder corn without husking, or husk and grind the corn into feed. He also asks whether it is economical to feed sheaf oats to dairy cattle, or better to thresh and grind them. He does not state whether he is renting or is the owner of a farm. If the latter we do not hesitate to advise him to build a silo. There is great economy of labor in harvesting and taking care of the corn crop in this manner, as well as in feeding it out. Moreover there is no other way in which so much loss can be avoided, or the feed preserved in so palatable a condition.

Before the silo came into so general use, among the more prosperous dairymen, many of them were accustomed to feed the corn without husking, and claimed this was the more economical way. Hiram Smith followed this practice for years. He also contended that it did not pay to thresh oats, and only this last winter we heard Mr. Charles Thorp, of Burnett, one of Mr. Mc Kerrow's Farm Institute conductors, and a progressive and prosperous farmer in Dodge county, say that he did not thresh oats for either cows or horses. He has tried both ways and claims that threshing is not only a needless expense, but a positive damage.

The writer of this reply does not feed oats to cows, simply however, for the reason that he considers them more expensive than bran or some of the other by-products, which are rich in protein.

AERATING AND COOLING MILK.

We use the deep setting cans (4 gal. cans) for our milk. In the summer time we place the cans in a box lined with tin and filled in with three inches of charcoal. The water is pumped into the milk box fresh, twice daily. But notwithstanding this, in warm weather, the milk will sour in twelve hours.

Will an aerator stop this? We have no ice. Soulon, Ill. SUBSCRIBER.

Aerating will add decidedly to the keeping qualities of your milk, if a thorough cooling is used in connection with it.

We are not positive, but should judge that your water box does not hold enough water to cool the milk thoroughly. It takes quite a body of well water to cool four gallons of milk at 100° to 60°. It will take three cans of well water at 50° to cool one can of fresh milk to 60°. Are you using water in that proportion to cool your milk? And is your milk cooled to near 60° F?

ANTHRAX.

A California subscriber inquires if there is any known *sure* cure for anthrax. Veterinarians seem to be pretty well agreed that anthrax is incurable, but may be prevented, or animals rendered immune thereto by inoculation. It is probable that Prof. Russell will treat of this subject in his Plain Talks on Bacteriology as Applied to Farm Problems.

OLEOMARGARINE RULE IN THE SOUTH.

The *Southern Dairyman* copies a recent comment, made by this paper, on the prevalence of fraud and adulteration in food, and says:

"The South is in a pitiable condition regarding the tameness with which she submits to be the favorite dumping ground for all kinds of adulterated food products. Our people, individually, complain about the frauds practiced upon them in this matter, but there is little organized effort made in any quarter to put a stop to these evils. In some Southern states the influences of the cotton seed oil interests have, up to this time, been too strong to admit of legislation against adulterated and counterfeit lard and butter. While in Mexico, recently, we learned that the laws of that country were very strict in reference to the sale of counterfeit and adulterated food products of all kinds, and that the laws are seemingly enforced with more vigor than with us. There, oleomargarine and like products may be sold under their true names, but woe be unto the person or firm that dares to sell counterfeit for the genuine."

All this subservience to oleomargarine comes through politics. It is not found alone in Southern states. We know of states in the North where the head boss in the dominant party shields the guilty from prosecution by law, and defeats the passage of right laws. We will tell our readers how it comes to pass: The oleo manufacturers have long purses. They contribute several thousands of dollars to the campaign fund in both parties. Then the political bosses protect them. They tried and succeeded in their game for four years in Wisconsin; but the State Dairymen's Association was aroused and it told the "bosses" in plain terms what it would do. The result was we got the legislation we wanted.

All that is needed is a little old time political independence, such as the old farmers of fifty years ago used to manifest.

A dairy farmer who is afraid of a political boss, or who will not stand up resolutely and defend his home, his farm and his business against political slavery of this sort, is a coward that even a scrub cow should despise.

The Davidson bill in Congress will meet these big contributions by the oleo combine, and certain leaders there will try and smother it. But let the farmers fire in their postal cards on which is written plain talk, and the bosses will not be in it. The Southern farmers need to do some talking as well as those in the North.

PLAIN TALKS ON BACTERIA AS APPLIED TO FARM PROBLEMS.

[By Prof. H. L. Russell.]

Second Series, IX.

HYDROPHOBIA OR RABIES.

There is no animal disease to which humanity is also subject, that is associated with greater fear, than that of hydrophobia or rabies. The horrible results which often follow from the bite of a rabid animal are such as to invest the subject with peculiar terror, and yet, the number of cases among human beings is, practically, very small. Even the mortality in well defined rabies does not exceed about 15%. The disease is, invariably, of animal origin, and is usually confined to the canine race, although other animal species, as well as man, may acquire it through a transfer of the specific virus by means of bites.

Among domesticated animals, other than the dogs, cats and sometimes cattle, horses and swine, "take" the disease. Wild animals, such as wolves and deer are not infrequently affected. A large percentage of the cases of hydrophobia among the peasants of Russia, come from wolf bites.

The disease is one of the most peculiar of those produced by living organisms. It cannot originate without the transference of the virus from some animal already affected with the disease. This is transfered by means of bites, the saliva of the infected animal being the substance that contains the contagious matter. On the unbroken surface of the skin, the saliva from a rabid animal produces no effect, but when the protecting surface is broken or abraded, the diseased matter "takes", or is absorbed into the system.

A varying period of time elapses (the period of incubation) before the animal, or person bitten by the rabid animal, shows signs of the disease. This period varies so much that it engenders a feeling of insecurity in cases of animal bites, as to whether a wound caused by an animal, is from a case of rabies, or not. Cases have been reported, where the disease did not develop within a year, and in a few cases, a manifestation of the symptoms did not occur, until two years after the injury. The rapidity of the incubation period is largely determined by the character and location of the wound. Slight flesh bites on the extremities, develop the disease much more slowly than wounds of similar magnitude upon the face or body. Bites through the clothing are apt to dislodge much of the virus.

The appearance of the disease in animals is frequently unaccompanied with any visible lesion, and often the symptoms are so obscure as to render positive diagnosis difficult. The disease is characterized by marked changes in the nervous system, accompanied with constitutional disturbances. In animals, particularly in dogs, the symptoms may assume two phases. It may become suddenly and violently "mad", biting and tearing at any object within its reach. This type is known as "furious rabies." In the majority of cases, the development of the disease is

"The Least Hair Casts a Shadow."

A single drop of poison blood will, unless checked in time, make the whole impure. Hood's Sarsaparilla is the great leader in blood purifiers.

It casts no shadow, but brings sunshine and health into every household.

Dyspepsia—"Suffered everything but death for years with dyspepsia. Nothing relieved me until I took Hood's Sarsaparilla and it made and kept me well. Can eat anything I wish." Mrs. Eugene Murphy, Hull's Mill, Danbury, Conn.

Consumptive Cough—"Five years ago I had a consumptive cough which reduced me to a skeleton. Was advised to take Hood's Sarsaparilla which I did and recovered normal health. I have been well ever since." Matilda Bridgewater, Cor. Pearl and Chestnut Sts., Jeffersonville, Ind.

Hood's Sarsaparilla Never Disappoints

Hood's Pills cure liver ills; the non-irritating and only cathartic to take with Hood's Sarsaparilla.

FENNER'S
Revolving Six-sided
CHURN.
Churns, washes, works without removing. Nine dairy sizes always in stock. Special attenton given to factory sizes.

more gradual, producing paralysis, at first partial, and later, more general. In the later type of the malady, known as "dumb rabies," the danger of transmission is lessened by the quieter condition of the affected animal, and its inability to move about.

There is one characteristic symptom in all cases of this disease, intense thirst, but the peculiar dread of water, from which the popular name of hydrophobia is derived, is confined especially to man. Many people are thrown into a state of terror from any wound caused by a dog.

It should be borne in mind that rabies cannot be transmitted unless the attacking animal is affected. In case of an accident of this kind, the first thing to be done, outside of the medical precautions, which should always be instituted, is to secure the animal that inflicted the injury. There is a current belief that if the animal is killed at once, the danger of infection, to the person bitten, is materially lessened. That such a course might allay the fears of the remainder of the community can be easily understood, but how the progress of the disease can be controlled in a person already inoculated, by means of the bite, is not so clear.

An animal suspected of rabies should not be killed, unless it is impossible to secure control of it in any other way. An animal may show strange and grave nervous symptoms, without being affected with hydrophobia, and it is of utmost importance to determine the fact. This can be done in two ways: First, by isolating the animal and keeping it under close inspection, until an accurate determination as to the character of the malady can be made. The second, and more accurate method, which can only be made by a trained expert, is to remove a small portion of the brain of the suspected animal, and introduce it beneath the brain membrane of a rabbit. This serves to carry over the virus of the disease from one animal to another, and if the animal is rabid, symptoms of the disease will manifest themselves in a few days. Notwithstanding the fact that this method enables one to transmit at any time the disease with certainty, the specific germ which causes the malady, which, of course, must be present in the inoculated material, has not, as yet, been discovered, although much labor has been spent by numerous scientists on the question.

Sometimes light can be thrown on the case by an examination of the contents of the dog's stomach. In a rabid animal, one often finds small sticks, stones, leaves and other things that have been swallowed by the animal during the furious outbursts.

The necessity of a correct diagnosis of the disease is rendered the more imperative from the fact that a cure for hydrophobia has been found that is almost always successful when taken in time. The treatment, however, is of such a character as to render its use unadvisable, unless the diagnosis is certain.

TREATMENT.

Some years since the great French bacteriologist, Pasteur, succeeded in modifying the virulence of hydrophobia material to such an extent that the inoculation of the weakened virus into a susceptible animal like a rabit, produced only a mild form of the disease.

By the introduction of different samples of the virus of gradually increasing potency, he found that it was possible to finally render an animal immune or refractory to the most virulent material. In this way the tissues became "acclimatized," so that the strongest virus that would invariably kill susceptible animals had no effect upon those thus immuned. This system of protective inoculation was first thoroughly worked out on animals.

On July 4th, 1885, the first experiment was made on a human being. A nine-year-old boy, who had been seriously bitten by a mad dog, was subjected to the treatment, and in the next ten days, thirteen injections were made. With each injection made on the child, a corresponding one was instituted on a rabbit. The earlier injections in the animal produced no effect, but as the strength of the vaccine was increased, the rabbits died, while the boy showed no symptoms of the disease whatever. This brilliant discovery was an eminent success, and from that time to the present, thousands of individuals have been cured at the Institute Pasteur at Paris, and in nearly every civilized country on the globe, similar hospitals have been established, where the beneficent results of this discovery can be made available to any one, suspected of having been exposed to the disease. The mortality rate of this disease has been reduced to practically nothing.

Last year the number of deaths that occurred at the Paris Institute, of persons undergoing treatment was only four out of nearly 2,000 cases. The treatment is practically specific, if applied in time. The value of the process lies in the fact that the period of incubation is quite long. Under ordinary circumstances, the disease does not begin to develop for several weeks after the bite, unless the wound is unusually severe, and on the hands, face, or neck.

If, therefore, the patient submits himself for treatment within a few days, he becomes "acclimatized" to the poison of the disease as a result of the protective inoculations, before the original virus has had time to develop in the system.

The whole success of the method lies in an early treatment. After the symptoms of the disease begin to manifest themselves no remedial methods are of any avail, for the poison of the virus has got in its deadly work. Besides a delayed injection of the protective vaccine, one other condition may defeat treatment, that is when the bite occurs from an animal afflicted with an unusually virulent form of the disease. In such cases, the incubation period is materially shortened by the more rapid development of the virus.

Upon the whole, however, the treatment is so successful that it should always be instituted as soon as possible after a positive diagnosis has been made. This treatmen has, to some extent, been employed among animals with very favorable results, but the difficulty and expense attendant upon its use, has precluded its use except in occasional cases in France.

Southeastern New York Farm Notes.

Planning for the Early Soiling Crops.—Garget.

ED. HOARD'S DAIRYMAN:—When the pastures become dry and short next summer, we will find it much more economical to supplement them with soiling crops, than to try to keep up the flow of milk by buying grain, and now is the time to plan for these crops, so that we shall have them when they are needed. For the earliest soiling crop, there is nothing better than oats and peas. If it is desired to feed them green, it is better not to sow the whole crop at one time, but to sow a part of the ground as early as it can be worked in the spring, then afterward make two or three sowings about one week apart.

It will be understood that only the Canada peas can be sown with profit so early in the spring, and these should be ordered in time so that they will be on hand by April 1st, so if the ground is in condition to work, they can be put in at once.

The peas, to make a good growth of vines, require a loamy soil, and it needs to be made quite rich. It will pay to give the ground a good dressing of stable manure, or if the supply is short to drill in fertilizer. You may read about growing this crop without much manure or fertilizers, but I have never been able to grow good crops of anything, without feeding them well, and especially has this been true in obtaining a large growth of peavines, either in the garden or in the field.

About two and one-half bushels of seed should be sown to the acre, mixing one bushel of peas to two of oats. Some claim to get good results from drilling in the oats and peas at the same time, but I would prefer to first drill in the peas quite deeply, then to cross drill the oats more shallow. I have a neighbor who has no drill, that sows the oats and peas by hand, then harrows them in and he gets good crops. There is little danger of sowing too large an acreage of oats and peas, for if the crop cannot be all fed green, it makes excellent hay, or it can be left until the oats begin to ripen, then cut and when dry, thresh, and feed the grain after grinding.

I notice that the conductors of the New York farm institutes, advise farmers in the east to feed ground oats and peas in place of bran, for the high freight rates make bran too expensive for our eastern farmers to feed with profit.

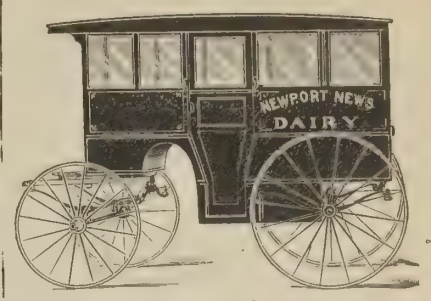
TIMELY PRECAUTIONS.

Some people in my vicinity are having trouble with the garget and caked udder. I have suffered considerable loss at different times from cows so affected, but I now believe these can be mostly prevented. One of my neighbors, who has some fine Jersey heifers, lately told his experience in having them all come fresh in milk, this spring, with no trouble with the udders, although they have been well fed all winter, and made up large udders. For about three weeks before calving, he fed them good clover hay, and each one a little bran, and took care to milk out the udders when they were too full.

He also fed them ocassionally a little saltpetre. He did not increase the grain ration until several days after the calves were dropped, and the result of his treatment is that all the heifers have healthy udders, and are now giving a good quantity of milk.

I call to mind Dr. Smead's talk about garget at the farm institutes. He said the garget was caused by a bacteria that lodges on the end of the teat. It works up in the teat and you have garget. The time to prevent it is at the first start. If you are afraid of garget, wash the udders occasionally with carbolated linseed oil, mixing one part of the carbolic acid with ten parts of the oil. If the garget has begun, in addition to this treatment, inject a tincture of sulphur in the teat.

I also remember the advice he gave to prevent milk fever: "If there is danger of milk fever, commence two weeks before the cow drops her calf to feed saltpetre and bromide of soda, these will help to thin the blood. Do not dry up the milk until it naturally dries up. If you do, the food that makes milk will go to make blood, and this may cause milk fever."



DEPRECIATION OF THE VALUE OF DAIRY FARMS.

Two farms have been lately sold in my locality at cash sales for less than the buildings on them cost. There has been a large shrinkage in the value of farms all over the state. But few wish to buy farms, they say that dairy products are so low that there is no money in farming. It is not because there is not plenty of capital to invest in farms, but it is because that the prices of produce are so near the cost of production, that with ordinary methods of farming, the margins are very small.

I recently talked with a man who owned farms that he rents, and he said that his tenants were paying him all they could afford to, and that he realized only three per cent on his investments. It is a deplorable condition of affairs, when that well improved farms will not sell for the cost of the buildings on them, and that people having capital to invest, even at these low prices consider them a poor investments. Unless our people can be taught better methods of farming that will reduce the cost of production, and the problem of a larger and more economical distribution of dairy products can be solved, thus giving the dairymen larger margins, the future of the Eastern dairymen does not look very bright. W. J.

FOR SALE!

The farm of the late Oscar Hasbrouck, situated in Ulster Co., N. Y., on the Poughkeepsie Bridge R., 10 miles west of Poughkeepsie, containing 300 acres, 60 acres of which is heavy timber. It is well supplied with small spring brooks running through it, and has a fine wind mill for bringing water to the barns and house. The buildings cost over $20,000, and are all in fine condition. Fine modern house heated with hot air. This farm is under a high state of cultivation. Wood lot alone is worth $5,000. This property is within one-half mile of depot, church, school and village. This farm is equipped with all farm machinery, tools, stock, etc. Must be sold to settle up the estate. For a gentleman's country seat and stock farm, this place has no superior. Possession given at once. For Price and particulars address one of the executors. IRA H. HASBROUCK,
Drawer 987, Kingston, N. Y.

The YOUNG AERATOR And Cooler

Needs no water or ice, removes all odors and gases, warranted to keep milk sweet from 6 to 12 hours longer than any machine on the market or money refunded. Circulars free,

Agents for Hand and Power De Laval Alpha Separators.

SOME THINGS TO BE THOUGHT OF JUST NOW.

We make no doubt there are hundreds of our readers who are thinking of needed improvements on the farm. The farmer can never bring the good things together all at once, but he can start this year to begin.

Let us suggest a few things that it will be well to make a beginning on this spring.

1. Buy a good registered bull of some one of the dairy breeds. Don't satisfy yourself with a grade animal because you can get him cheap. You can buy log chains made of cotton yarn, and they will cost much less than if made of iron. But will they stand the strain or do the work? Don't breed from a grade bull, for he is as apt to throw towards the grade side as the other.

2. Set about building a silo. It is a great help in two ways; it will reduce the cost of cow food, and it will stimulate a larger flow of milk. Make a start this year towards building a silo.

3. Put in a piece of alfalfa this spring, if it is not more than two acres. Try it for yourself. We believe it can be successfully grown in thousands of localities where the farmers think to the contrary.

4. Make the determination to have better stalls and tie-up arrangements for your cows. Change over the old stable the coming summer, and put in two to four times as many windows as you now have. You will see how it will pay next winter when the sun shines in upon your cows, and they show increased vigor and thrift.

Correspond with the men who are advertising improved cow stalls. Drop them a letter and get their ideas. Lumber will not be any cheaper for years, and now is a good time to do some of these things. Be sure to get a small spraying pump, and with it whitewash the cow and horse stables thoroughly. With the spraying pump, one man can do as much as ten with the brush.

Many a man wants some of these improvements; all he needs is a jog on the elbow to start him along.

It is a better investment to lend your surplus cash to the farm and the cows, than on a note of hand.

AN OBJECT LESSON IN BREEDING AND ITS RESULTS.

Mr. H. C. Taylor of Orfordville, Wis., writes us that from Feb. 20th to 26th a twelve-year-old cow in his herd, Marine by name, and a daughter of Diploma and his full sister, Comlassa, (and hence a double granddaughter of old Combination) gave 248 lbs. of milk which yielded 16½ lbs. of butter after being properly salted and thoroughly worked. In addition to the ordinary disabilities incident to age, this cow had lost the use of one quarter of her udder, and it is only fair to assume that with a more favorable environment she might have done considerably better.

Cows of this character are object lessons in breeding; for dairy ability in this degree is not the result of catch-as-catch-can breeding, and more particularly so when similar capacity is not uncommon in the family. So far as known, Diploma, sire of Marine, had only eighty-five daughters, and, notwithstanding several of them were never tested, including some as promising as any that died of milk fever, Marine is the forty-fifth of these daughters to enter the 14-lb. list. In addition to this, fourteen sons and two grandsons of Diploma have produced record making daughters.

Such success as this stamps Diploma as a bull of wonderful potency and when it is added that it was his daughter, (Merry Maiden) that won the grand sweepstakes in the dairy contest at the World's Fair, it would seem as though the claim for him of first place among dairy sires might well nigh pass unchallenged.

It goes without saying that Diploma himself was well bred, and if his sire and dam had no other claim to recognition than this one son, it would suffice to demonstrate their dairy merit. But as a matter of fact he was one among many only less conspicuous than himself. His dam was Frankie's Lass with a personal record of 17 pounds 3½ ounces butter in seven days, and three record making daughters; and his sire was old Combination, with twenty-five record making daughters to his credit, and grand daughters by the score, including Brown Bessie, the champion butter cow at the World's Fair, as well as Merry Maiden.

Marine was not only intensely inbred herself, but her last calf (a solid color bull) dropped December 12, was by her own son, Goldie's Torment 5th(thus giving him 75 per cent of the blood elements of Diploma), and she was bred January 25th to Brown Bessie's son, Recorder.

From a Michigan Creamery.

What Variations in Tests are Permissible.—Ration Formula.

ED. HOARD'S DAIRYMAN:—I have been a reader of your excellent paper for nearly one year and have been thinking for a long time of asking you to formulate me a good ration for my grade Jerseys, weight about 900 pounds. Corn and cob meal, $10.50; bran, $15; oil meal, $28; cotton seed meal, $22. I have cow pea hay, oat hay and corn fodder. Two cows fresh in December, one in February and two last August.

We have been patronizing a creamery near us, which began running March 14th, 1898. It began with barely 1,000 pounds of milk; gradually increased during the summer to over 10,000 pounds, and is now receiving every other day, about that amount. There is a skimming station about five miles distant from the creamery, which sends in the cream from over 5,000 pounds of milk every other day.

Two silos were built last season and more will be built this summer. The company charges the patrons 3c per pound for making the butter and returns 80% of the milk to patrons.

Some patrons claim they can make more butter than the creamery, while others claim the reverse. They take samples of the milk each day and test twice a month. What variations in the tests should one expect, tested in that way, with same cows, amount of milk, care and feed? C. H. K.

Fawn River, Mich.

For the ration we suggest as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
6 lbs. cow pea hay	5.36	.65	2.32	.07
6 lbs. oat hay	5 47	.26	2.78	.09
6 lbs. corn stover	3.57	.10	1.94	.04
5 lbs. bran	4.41	.63	1.93	.15
5 lbs. corn & cob meal	4.45	.32	3.15	.18
1 lb. oil meal	.91	.29	.33	.07
Totals	24.17	2.25	12.45	.60

It is impossible to say what variations may appear in these semi-monthly tests, without knowing all the conditions, and this is simply impossible. The exposure of cows to a cold storm, or continued cold or hot weather, or to flies, changing feed, rough treatment, or any other departure from the ordinary routine will cause the test to vary quite markedly. It can be stated with utmost confidence that the Babcock test itself is as accurate and unvarying as any weighing machine that can be had. But like scales, it must be properly handled, and the samples must be taken with care. If there is any question between the patrons and the creamery as to the tests, ask the most dissatisfied patron to come in and witness the whole operation. There should be the most open frankness on this as on all other matters. Make some daily tests and compare them with the semi-monthly tests, so as to be sure that everything is all right.

An Estimated Herd Yield.—Milking Paralysis.

ED. HOARD'S DAIRYMAN:—During '98 I milked the following cows, nineteen in all, and made milk and butter as follows:

Seven heifers dropped first calf at different times during the year and milked altogether thirty-two months, eighteen days. One heifer dropped first calf in December '97 and milked through the entire year. Two dropped second calf during the year. Of the remainder three were sold, April 1st, having milked eight months, twenty-four days of the year.

One was sold later having fattened two calves eight weeks, and milked six months, five days. The rest were here the whole year.

Only seven of the entire lot had dropped more than two calves prior to January 1st. '98.

The milk yield was 83,381 lbs. and an average of at least 10 pounds per day is used in house, besides considerable cream which would leave 79,731 lbs. milk skimmed, making no allowance for the cream used.

We made 4,410 lbs. butter and the cow that fed the calves eight weeks may fairly be credited with 64 lbs. butter for the time.

What do you consider was the average butter yield per head for the year?

If any others are troubled with milker's paralysis I would say that I obtained considerable relief by blistering the muscles of the arm between the wrist and elbow continuously for a week or more, with mixture of Croton oil and Iodine.

N. Y. A. D. MCBAIN.

From the above data, which would allow only a very loose estimate, we should judge that the yield was in the neighborhood of 366 pounds of butter per year. This may not be within twenty-five pounds of the actual yield.

Prof. Shaw's Figures Criticised.

ED. HOARD'S DAIRYMAN:—After reading Mr. Shaw's article in February 24th issue, I conclude his premises are very erroneous. He supposes he can get $31.50 for a skim milk calf from his cow at 1 year old, and $30.00 for the butter. We can't begin to do that well here. Have good cows, good feed, and good markets too.

He expects his skim milk beef to bring 4½ cents per pound; 3½ cents is as high as he should put it, and it will take a lot of good grain and hay to make it bring that, which he don't consider at all.

Nor can he get $30.00 for the butter, from such a cow. If she breeds regularly annually 9 months is as long as he can milk her and start a calf. So 125 pounds of butter from such a cow would be the limit, at 15 cents would bring in $18.75.

His calf account would also stand about as follows: In addition to the skim milk he must feed about as follows to get a fair 700 pounds annual at one year old: Linseed meal, $2.00,

Two or three customers can compel any dealer to keep Macbeth's lamp-chimneys.

Cement Drop for Cow Stalls.

ED. HOARD'S DAIRYMAN:—The man who has a wooden drop hasn't a sweet smelling stable, I don't care how much straw, sawdust, road-dust, muck or plaster he uses; the odor is still there. If made of hemlock, it will last only a few years, and of pine it costs as much as cement. So why not make of cement and have one that will last a lifetime? Any mason knows how to build one, but for the benefit of those who wish to do it themselves, here's how, in detail:

For my 72 foot by 6x16 inch drop it took one barrel Portland cement, $3; two barrels Buffalo cement, $2; mason spreading, $1, a total of $6, or twelve feet for a dollar.

Now, where's the dairyman that can afford to be without one, at the above cost?

I dug a trench, three feet wide down to gravel or hard pan, and as long as I wished drop. Fill with stone, sledge them in, put on gravel and level it up. Have sleepers run parallel with drop. Set two plank on edge, two inches from sleepers. Tack on cross piece to hold in place. Take one part Portland cement, two parts Buffalo, four parts sand, four parts gravel; mix to a thin mortar and run in between sleepers and plank. In about six hours take away the plank and leave until next day. Then put in bottom, two inches thick. Let dry slowly for two weeks, and in years to come you will find it was the best investment you ever made. W. H. P.

Chautauqua Co., N. Y.

Our Special Elgin Letter.

ED. HOARD'S DAIRYMAN.—The offering of butter on Monday's Elgin Board of Trade was 4,380 pounds, of which 4,020 pounds sold at 21 cents, all bids being at that figure. One lot of 360 pounds received no bid. The Quotation Committee announced the market steady at 20½c. The following sales were reported:

Factory	*Pounds*	*Price*
Shabbona	1,140	21c
Shattock's Grove	2,280	21c
Malta	400	21c
Total	4,020	

The sales for the corresponding week of the three preceding years were as follows:

Mch. 28, '98, 10,260 lbs. of butter sold at 18½c.
Mch. 29, '97, 14,820 lbs. of butter sold at 21@22½c.
Mch. 30, '96, 15,900 lbs. of butter sold at 21c.

The New York market was reported steady at 22 cents.

A letter from C. Y. Knight was read telling of the difficulties, in securing legislation against butterine in this state and the Board adopted the following resolutions:

WHEREAS, It is reported that an effort is being made in our legislature to repeal the anti-color law, therefore be it

Resolved, By the Elgin Board of Trade, representing thousands of farmers, that the anti-color law is most important for the dairy interests of our state and it should remain on the statute books and we condemn all efforts from any source looking to its repeal or modification. Be it further

Resolved That our Secretary be instructed to send a copy of this resolution to each senator and representative of our state.

Elgin, Ill., March 27, 1899 H. C. B.

ENTRIES for Volume 9 of the American Duroc Jersey Swine Breeders' Association, will close April 15th.

DAIRY MARKETS.

ELGIN, Ill., March 27—Butter—Steady at 20½c; offerings, 73 tubs,; no bids received for six tubes; call sales, 67 tubs at 21c; butter last week, 20c; one year ago, 18¾c.

CHICAGO, Ill., March 27—Butter—Creamery, extra, 20½@21c; firsts, creameries, 19@20c; seconds, 15@16c; Dairies, selections, 18c; extra ladles, 14c.

Eggs—Fresh, at mark, cases included sold at 11½@11¾c.

Cheese—Full cream, Twins, good to choice, 11½@12c; Cheddars, 11½@12c; Young America, 12c; Swiss, 11@13c; Limburger, 7@9½c; Bricks, 9@12½c.

Cattle--There was no quotable change in the general cattle market. The better grades were fully steady, while poor to fair kinds were weak, with instances of a slight decline. Most grades of beef cattle however, are 20@30c lower than a week ago. Exporters were free buyers, principally at 5.10@5.30. Native steers averaging 830@1,609 lbs. sold at 3.90@5.70, bulk 4.60@5.20; fed Western steers, 4.25@5.40; Missouri Texas 4.40@4 65; straight Texas steers, 929@1,211 lbs. 4.35@4.65; Texas oxen, 3.50@3.75; Mississippi steers, 746@799 lbs. 3.80@3 85; native cows, 2 25@4.35; heifers, 2 90@5; bulls, 2.80@3.90; stags, 3.60@4.50; feeding cattle, 3.25@4.65.

Bran—Scarce and in demand at 12.50@13 per ton.

MILWAUKEE, Wis., March 27—Butter—Creamery—Fancy prints, per pound, 20c; extras 19½@20c; firsts 18@19c; seconds 16@17c. Dairy selections, per pound 15@17c. Roll, fair to choice fresh, 11@13½c. Market strong, and everything coming in quickly taken.

Cheese—American Full Cream, October Twins 11½@12c; Brick, October, choice, 11¼@12c; winter made, per pound, 11@11½c; Limburger, Fall, choice, per pound, 9½@10c; winter made 9c. Swiss, Drum, choice 12½@13c; Block, choice, 10½@11c.

Eggs—Fresh, per doz. 11½@12c. Market declining under ample offerings for present requirements of trade.

NEW YORK, March 27—Butter—Creamery, Western extras 22c; firsts 21@21½c; state extras 21¼@22c; firsts 20½@21c.

Cheese—State full cream, large colored or white fancy, 12c; choice 11¼@11¾c; small fancy 12@12¾c.

Eggs—Western 13¼c.

BALTIMORE, Md., March 27—Butter—Market firm; creamery separator, extra 23@24c; creamery separator, extra firsts, 21@22c; creamery, first, 20c; ladle, extra 15@16c; Western store packed 11@13c.

Eggs—Market steady; strictly fresh stock 12@12½c; duck eggs, 23@24c per dozen.

PHILADELPHIA, Pa., March 27—Butter—Separator creamery extras, 22c; creamery firsts, 21c; seconds, 19@20c Imitation creamery, extras, 18c; firsts, 16c; seconds, 14c. Ladle packed, extras, 16c; firsts, 15c; seconds, 14c. Print butter, creamery, extras, 23c; firsts, 22c; seconds, 20c;

Eggs—Pennsylvania and near by, 13½c; Western, 13½c; Southwestern, 13¼c.

KANSAS CITY, Mo., March 27—Butter—Frm; creamery 14@20c; dairy 15c.

Eggs—Steady, with an uneven feeling; supplies well cleared up Saturday, but offerings to-day were equal to requirements; fresh Missouri and Kansas stock, in new cases, cases included, 10½c, cases returned, 10c.

ST. LOUIS, Mo., March 27—Butter—Steady; creamery 18@22c; dairy 13@17c.

Eggs—Lower; 10¼c.

CINCINNATI, O., March 27—Butter—Firm.

Eggs—Steady; 11c.

Cheese—Firm; good to prime Ohio flat, 11¼c.

NEW YORK MARKET.

NEW YORK, March 25.—Butter—Receipts for the week, 35,625 packages. Exports for the week, 2,179 packages. There has been a full supply of fresh creamery butter, in fact, a very large proportion of the receipts was made up of this grade and notwithstanding the scarcity of New York State dairy, fresh imitation creameries and good useful June freezer goods, receivers have found it hard work to maintain the price quoted early in the week, say 22c, and at the close there were freer offerings of Extras at the price; but stocks are light and holders are not disposed to cut prices on the top quality. So called firsts, which sold freely at 21½@22c are dropped to 21c with more sellers than buyers. Finest imitation creamery sells quick at 17@18c and there is not enough of it arriving to supply the demand. Fresh ladles scarce and prices firm. New York State Dairy arrives very sparingly and sells at 20@21c for selections and in entire lots at 17@19c. The stock of old butter is about used up and we note sales fine June Creamery at 18@20c, fair to good lots 15@17c and odds and ends of old stock at 12½@14c. We quote: Creameries, extra, 22c; medium 20@21c; poor, 16@18c. Dairies, extra, 20@21c; medium, 17@19c; poor, 13@15c.

Cheese—Receipts for the week, 9,269 boxes. Exports for the week, 6,285 boxes. The stock of fine cheese is small and in few hands; most of the trading is in early and very late makes at full prices. Business was less than last week, buyers taking only enough to supply their immediate wants, and prices are unchanged. We note the arrival of few parcels of new cheese which sold at 11@12c. We quote: Full cream, small, extra, 12½@13c; medium, 11½@12c; poor, 10@11c. Full cream, large, extra, 12c; medium, 11@11¼c, poor, 9@10c.

Eggs—Receipts for the week: 93,104 cases. Market opened at 14@14½c and closed at 13@13¼c. Receipts were heavy and demand good. We quote: N. Y. State & Pennsylvania, per doz., 13@13¼c; Northern & North Western, 13@13¼c; Southern, 12½@13c. DAVID W. LEWIS & Co.
117 Chambers St., New York.

BALTIMORE MARKET.

BALTIMORE, March 23—Butter Receipts of current make of separator creamery butter have been lighter than were to be expected at this time, and the demand has been equal to absorbing all lots that would grade satisfactory, and some that passed under pressure. The condition of this market is now, and has been for a few weeks, such, that it was ready to respond to any upward movement in prices, principally because the daily receipts were not quite enough to spread the daily bread, and had to be pieced out with held goods from the freezers; consequently if the advance, begun in the east, is sustained, a state of affairs which we dealers depreciate, our friends in the west will find us on the band wagon playing in the pocket stirring march along with the windiest of them. Our freezers are nearly empty, owing to the prompt response to the samples sent out last week, so the slim dependance placed upon the well-saved June extras has been taken away, and "it's pay the price or do without," says the receiver to the consumer. Gathered cream makes are not increasing, and they have shrunk to the lowest point known to the trade, the receipts being so light as to cut no figure in the transactions worth noting. It is still so with imitation creameries, and ladles are nearly as scarce. Blocks and prints are in freer receipt, and the demand being good, there is no accumulation. Rolls continue in light receipt, with a good demand for all sweet stock.

Creamery separator extras 22@23c, firsts 20@21c, seconds 18@19c; Gathered Cream, extras 19c, firsts 18c, seconds 17c; Creamery Ohio, extras 20@21c, firsts 19@20c seconds 17@18c; Roll, extras 14c, firsts 13c, seconds 11c; W. Va. Roll, extras 13@14c, firsts 12c, seconds 11c; Creamery Blocks (2 lb) extras 23@24c, firsts 21@22c, seconds 19@20c; Creamery Prints (½ lb), extras 23@24c, firsts 20@21c, seconds 18@20c; Md., Va. & Penn. Prints, extras 20c, firsts 18c, seconds 15@16c.

Eggs—While the receipts of eggs so far this week have been quite liberal, we are glad to note a good active demand, which has kept pace with the supply. All invoices have been promptly placed on arrival. Our market is in good shape, and firm at 12¼ cents. We advise liberal shipments next week for the Easter Holidays. Duck eggs are in more liberal receipt, and our market, like all others, is lower; our quotations are for large, clean eggs; small and dirty stock have to be sold lower.

Cheese—Receipts light; demand good; market firm as quoted.

N. Y. State Cheddars, fine 12@12½c, choice 11@11¼c, fair 9@10c; N. Y. State Flats, fine 12@12½c, choice 11¼@11¾c, fair 9@9½c; N. Y. State Small, fine 12¼@12¾c; choice 12@12½c, fair 9½@10c; Ohio Flats, fine 11@11½c, choice 10¾@11c; fair 8½@9c; Ohio Picnic, fine 11½@12c, choice 10@11c, fair 9½@10c; Swiss Cheese, fine 11@12c, choice 10c, fair 8½@9c.

FOREIGN MARKETS.

BOSTON, March 25—Cable advices of this date from the principal markets of Great Britain to Geo. A. Cochrane give butter markets as quiet but firm. Arrivals have been heavy for the past month, rather more than current consumption could take care of, which gave buyers the control of markets. With perspective diminishing receipts, holders are firm and with more seasonable weather, a better demand with a probable advance, is looked for in the near future.

Australia has still the controlling influence and will for a little while longer, regulate prices. The finest now is nominally 20½@21c with very good value to be had at 19@19½c. Very little Canadian in stock of arriving, and when fine, sells close up to Australian. American creameries continue a dragging sale, with prices ranging from 18@19c for the finest. Imitation creamery has only a moderate sale at 16@17c. The demand for ladles does not improve, what few sales transpiring take a range from 15c downwards.

Cheese markets continue active and firm. Importers have control of the market and are not free sellers of finest Septembers even at 11¼@11½c. Higher prices are confidently expected as the season draws to a close. Under grades are in very light supply and active request at anything from 11c downwards.

The "ALPHA" DISC Cream Separator Invention

The De Laval Company introduced the centrifugal cream separator of the "hollow-bowl" type in America in 1883. In 1891 it introduced the new and improved "Alpha" disc or milk-strata system into the bowls or revolving cylinders of its machines. The new system instituted at once the gradual revolutionization of centrifugal separation, just as centrifugal separation had of older creaming methods in the first place. Since then the disc system has been further perfected, and the intervening years of experience have demonstrated the "Alpha" improvement to be as great an advancement over other forms of the cream separator as was the centrifugal separator over gravity setting in the beginning.

The "Alpha" invention places in the separating bowl a system of circular discs or plates, which form a series of inclined sections or compartments, by means of which the milk in the bowl is divided into thin layers or strata. The milk is thus subjected to the centrifugal force generated by the revolving speed of the bowl *in thin sheets*, instead of in practically *solid bulk* as in all other machines. Each one of these different sections or divisions becomes, in a sense, a complete and distinct separating factor in itself. It makes of the whole a combination and concentration of from twenty to sixty contributory separating agencies, according to the size of the machine, into a single bowl. It practically makes the work of the bowl from twenty to sixty times more effective, and in attaining the same results under exactly similar conditions it would be found to actually possess such multiplied effectiveness.

Most of the "hollow-bowl" separator patents expired some years since and that type of separator is now made by a number of former gravity creamer manufacturers whom the DeLaval Company forced out of business in the making of such creamers. The "Alpha" disc system, however, is thoroughly covered by strong protective patents and its use is therefore possible only in the "Alpha" DeLaval machines.

The new 1899 catalogues—"Dairy" and "Creamery"—explain and illustrate the difference in separator construction in such detail as to be plain to anyone.

Guernsey Bulls—and bull calves for sale. The best blood of two Experiment Station tests. Prices from $35.00 up. WILLIAM BLACK, Box 357, Mt. Vernon, Ind. 6-2

For Sale or Rent—The Portage creamery, Portage, Wis. Immediate possession. Liberal terms to good party. WILLIAM FULTON, Prop. 5-tf

Wanted—Position is wanted as manager of a stock or dairy farm, by an experienced man. Would board help. Address LOCK BOX, 724, Malone, N. Y. 5-4

Wanted—Ten Men; able to give $200 security. To canvas for memberships to the Veterinary Science Association of London. Apply in person or by letter to room 5. Sutherland block, Janesville, Wis. 5-3

For Sale—At a sacrifice, for proper reasons, large successful creamery. Best markets, cheap freights by water and rail at the door; 120,000 lbs. butter 1898; fast growing milk supply; perfect butter climate; no ice needed; spring water piped; green grass year round. Address at once, R. D. SANFORD, Coquille, Oregon. 6-2

Hermanville Tamworths, Cross-heds, etc. J. A. MACDONALD, Hermanville Farm, P.E.I., Can. 32-52

An Entire Carload—Of high graded Jersey cows and heifers are in my hands for sale immediatley. F. H. MERRELL, Portage, Wis. 52-tf

For Sale—A very desirable and good paying dairy, consisting of 20 head, or more of Holstein graded cows; average milk sales of two hundred dollars per month. C. H. ELLIS, Waxahachie, Texas. 52-tf

Buttermaker wants situation; 8 years' experience. J. E. FORWARD, Mechanicsburg, Pa. 6-2

To Exchange—320 acres good Texas land, located 15 miles west of Beaumont, on So. Pac. Ry, and 3 miles from station. Will exchange land for Holstein cattle. Address A. R. CROUCH, Granada, Minn. 6-4

For Sale—Creamery outfit, very cheap. Write "DAIRYMAN," Box N, Hopkinsville, Ky.

For Sale—Holstein-Friesian bull calves of choice breeding. Will sell cheap if taken soon. For particulars address, JOHN SHUGART & SON, National Military Home, Ind. 7-6

The White Man's Burden is paying rent for a poor farm. Now is the time to secure a good farm on the line of the Chicago, Milwaukee & St. Paul Railway in Marinette County, Wisconsin, where the crops are of the best, work plenty, fine markets, excellent climate, pure soft water, land sold cheap and on long time. Why rent a farm when you can buy one for less than you pay for rent? Address C. E. Rollins, Land Agent, 161 La Salle St., Chicago, Ill. 7-2

For Sale—The choicest located 160 acre stock and dairy farm in Southern Minnesota. Joins town site of Windom, County Seat of Cottonwood County and only 25 miles from Iowa. House is 30x16 and 14x16 all two-story with addition and stone wall cellar 16x16. Barn is 40x45, 10-ft. posts. Has also granary, corn crib, poultry house, good wells, etc., etc., and the Des Moines river flows through the pasture. 20 acres native timber on river, rest in field, pasture and tame grass. Creamery within one-half mile. The farm I advertised in this paper March 10th I sold to first party that came and looked at it. This is another decided bargain. Act quickly. Call on or write for prices and terms to THOMAS E. SIME, Windom, Minn.

Wanted—Position by a first-class butter maker, either in a factory or in farm creamery. Four years experience. First-class references. Wages reasonable. Address CHAS. E. DULLEA, Winthrop, N. Y. 7-2

For Sale or Trade—A creamery, as good as new, located in a fine dairy country in South Dakota. Will sell cheap, or trade for land, cattle or sheep. Address J. C. NIELSEN, Viborg, South Dakota. 7-2

Wanted—Near Milwaukee, an experienced dairy farmer, single man. Must be neat, kind to stock, and a first-class milker. References as to character and ability required. Address DAIRY FARMER, care of Hoard's Dairyman.

Keeping Check on Milk Drivers.

ED. HOARD'S DAIRYMAN:—Noticing that information is wanted as to how to keep check on milk drivers, I will try and explain my way of keeping tab on them. I have an account with driver who, each morning, receives, say, 200 quarts of milk in bottles, for which he gives a receipt on a printed form, which states exactly the number of quarts and pints of milk, quarts and pints of cream, and quantity of butter. On his return I check him off, and he has brought back, say, 25 quarts of milk, leaving 175 quarts to account for either in cash, milk tickets or charges to monthly accounts. In this way it is impossible to defraud employer, and by charging driver up with every shortage, he will very soon become as particular as his employer regarding the disposal of the produce.

So. Dak. D. C. LORIMER.

Hood Farm Pogis 40684.

The proprietors of Hood Farm herd send us the following:

ED. HOARD'S DAIRYMAN:—The superior breeding and grand individuality of Hood Farm Pogis, owned at Hood Farm, Lowell Mass., warrants his being used as one of the principal service bulls in this great herd. He was dropped Aug. 2, 1893. In color he is solid lemon fawn, is extremely long and very deep, with flat ribs, remarkably thin over the shoulders, and has exceptionally long rudimentaries, placed far apart. His general make up, style and finish, can be better shown by his picture, given herewith, than described. His sire is Oonan's Pogis, the sire of 5 in the 14-pound list, by Ida's Stoke Pogis, the sire of 29 inthe list, including Bessie Lewis, 32 pounds, 4 ounces. Oonan's Pogis is out of Oonan, test, 22 pounds, 2½ ounces, the dam of 6 tested cows with butter records over 14 pounds each, and 5 sons with tested daughters. Ida's Stoke Pogis is a full brother of Ida's Rioter of St. Lambert, the sire of 28 in the 14-pound list, and Exile of St. Lambert, with 68 tested daughters, is his full brother in blood. The dam of Ida's Stoke Pogis is Ida of St. Lambert, record 30 pounds, 2½ ounces butter in one week, 67 pounds milk in one day, a full sister of Allie of St. Lambert, 26 pounds, 12 ounces.

HOOD FARM POGIS.

Hood Farm Pogis won as a two-year-old the sweepstakes prize as the best bull at the New England fair, and headed the first prize herd. In 1897 he took first prize as the best bull, and headed the first prize herds at New England fair, Portland, Maine, and the Massachusetts State Grange Fair at Worcester. At both places his heifers won first and second in their class. He was shown in 1898 and headed the first prize herd at the New England fair at Portland, York County fair, Saco, Me., and Danbury fair at Danbury, Conn. At these three fairs a heifer by him won first as best yearling, and twice one of his bull calves took first prize.

A Nebraska Holstein and Her Progeny.

A Remarkable Record.

ED. HOARD'S DAIRYMAN:—Having renewed my subscription, I thought you would be willing to insert a short letter giving some of my experience, and as I was born on a farm over half a century ago, I have learned some things and can learn more.

On June 1st 1887, I bought a Holstein Friesian heifer, Dora Midnight No. 7,032, She was calved 11th of April, 1886.

From June 1st, 1887, to this date, I have raised from her and her descendants on this farm, 85 head of cattle. I sold 21 cows of her descendants which have had 16 calves. W. F. Black of Loveland, Colorado, bought sixteen of her female descendants last July. He wrote me last week that he had thirteen calves from twelve of her cows. This makes 101 thoroughbred cattle from one cow in eleven years, nine months.

I have the old cow now, yielding about five gallons of milk a day. She calved September 16th, 1898. She has given me nine heifers and two bulls. Have any of your readers had an equal experience? I have lived on this farm nearly nineteen years and have raised a good many cattle during that time. I have never lost a calf from scours in that time, neither have I ever had a cow to have milk fever, yet all my cows will yield from five to eight gallons milk per day, at maturity, when fresh.

It will make this letter too long to tell how I feed calves and cows and take care of them because I keep no drug store and will say here that I never gave a cow or calf a dose of medicine in my life.

Lancaster Co., Neb. JOHN C. DOUBT.

Cream and Butter.—Churning Temperatures.—Washing and Salting.

ED. HOARD'S DAIRYMAN:—I suppose "that woman" means myself. You know the old saying: "When the shoe fits, put it on;" so you see I come again in self defense. When I wrote the article mentioned, it was not instruction in butter making, but simply showing different ideas and different results of men's work. We find men all over, working not only with wrong ideas of life, but also wrong impressions of their work and its results. As to the man referred to, he was doing work a great deal harder than was necessary. He was aware of the fact that it was a failure, but he was neither willing to do differently, nor willing to admit that some other way was better.

In writing as I have, I do not mean any one to ever suppose that I think I know all there is to butter making. I only know this that the way I advocate is far superior to the old method. I have gone from the dash churn, and the pans on the top shelf of the kitchen cupboard to pans in the cellar and a five-minute crank churn, where one of us sat on the top to hold it down, when the other turned the crank and churned 3, 4, 6 or 8 hours instead of 5 minutes.

I have said in a number of other articles, if you churn with a power, churn at from 54° to 58° according to the season, but if you churn by hand, you must churn at a higher temperature, 60° to 64° must be used according to the season, consequently none of the butter fat is left in the buttermilk.

If you run a separator, as I am happy to say we have for six years, skim heavy, that is, turn your screw to leave as little milk as possible in your cream; churned at so high a temperature as 62° or 64°, such heavy cream is apt to come too quick; before you realize it you have too large granules, and as a result mottled butter. But if churned from 54° to 58°, it will come in fine granules, like small bird shot, and can be washed, salted and gathered in that condition, ready to put into your jars, direct from the churn, without even the use of a ladle, and you will have but little water to work out, and no mottled butter.

One of the most frequent causes of mottled butter is too large granules; then when the cold water and salt are put on, it hardens the outside, the salt does not penetrate, and when packed, the salted butter becomes more yellow and, consequently, white streaks all through the butter.

I often churn from one to two hours, or from 75 to 100 pounds of butter. I would rather do that than have it come in fifteen minutes. The horse is doing the work, and I know from experience it is better.

I think one of the difficulties of long churning is too thin cream or not enough acidity Keep the whole of your cream sweet, until 24 hours before churning, at a temperature of 45°, then warm up as high as you like. I use about 65°. Put in your ripener, or in summer, it will sour of itself, generally. Before churning, cool down to the desired temperature; your cream will be smooth and nice, and there is no difficulty in the churning. Churn only until the grains are like small shot or mustard seed. If it does not separate, throw in some salt and a little water; turn a few times, and your butter is all on the top.

Use warm water if you like for washing, but I do not think it is the best way, your granules pack too quick in gathering. In summer, I use water as cold as 40°, and I never, since doing this, have had soft butter, even on grass, and such butter will require no two workings, but can be packed direct into your jars. A second working is useless work, it can all be done in a barrel or box churn.

I think brine salting is misunderstood. Wash your butter carefully, drain off all the water, then carefully put your salt in, tipping from side to side to get it even. One quart bowl of salt to 15 or 20 pounds of butter. Turn your churn slowly at first to get the brine formed in this way all around the butter granules, then slowly begin to gather.

I think from what I have heard of Mr. Gould, this is his method of brine salting, also. But as I said before, your granules must be small to begin with. I am never without a market for butter made in this way, and for over a month, I have had to buy butter of other creameries to use on my own table, as I could not get ahead of my customers.

I have tried to make this just as plain as possible, but we must all remember that we did not learn our letters in one lesson, and it takes patience, time and work to succeed in anything, and hence the old motto: "Try, try again. FARMER'S WIFE

Dodge County, Wis.

New York Feeding and Breeding Problems.

A Question to Mr. Lighty and a Significant Postscript.

ED. HOARD'S DAIRYMAN:—I wish to know if my ration for cows is correct. I mix my grain, 150 lbs. bran, 100 lbs. corn meal, 50 lbs. buckwheat middlings, 50 lbs. Cleveland Linseed Oil Meal; feed four to eight pounds a day as I think they need according to size and time of lactation, 35 to 40 lbs. corn ensilage, all the clover hay they will eat at one feed, balance of roughage, corn stalks, and straw to eat what they want and the balance bed them.

Grade Jerseys weigh from 760 to 900 lbs. I weigh every milking, and test with a Bab-

☞ When writing mention HOARD'S DAIRYMAN.

cock milk tester as often as I think necessary. Have Bidwell stalls with plank on cement floor.

I want to improve my herd now by the purchase of a registered sire and also get some other stock that I can register, but wish to know how I'll be able to determine whether the papers are genuine or not; also how I can get posted to know if the pedigree is worth what I'm paying or not. I want to study up the pedigree of all registered Jerseys but don't know where to begin or whom to apply to and I thought perhaps you might help me.

I soil my cattle through the summer. I was very much taken with Mr. Lighty's article on page 8, Feb. 17, and I wish to know how I shall set a drill for wheat to sow the right amount of cow peas and kafir corn.

From ten of my grade Jerseys, I made 96 lbs. of butter a week this winter, the cows being from all ages, two-year-old heifers to eight-year-old cows, and all stages of lactation. F. D. C.

Silver Creek, N. Y.

P. S.—I was without the DAIRYMAN one year and its return seems like meeting an old friend and I don't see how I can get along without it.

The grain mixture as above is certainly very good whether judged from the theoretical standpoint or by the results reported. The most that could be expected from any change would be a possible lessening of expense. Buckwheat middlings are frequently much the cheapest feed that can be bought. We should expect about the same results from a grain mixture of equal parts by weight of bran and buckwheat middlings, and if the cost would be appreciably less, it might be well to experiment a little, but only in a small way at first with cows that make 9.6 lbs of butter per week.

It would be an endless and useless task to investigate the pedigrees of all regis'ered Jerseys. Send to the American Jersey Cattle Club, No. 8. W. 17th St., N. Y., for the books, Butter Tests of Jersey Cows, and you will be able to get a pretty good insight as to the individuals and families which have proven their excellence. Breeders of registered cattle are, as a rule, honorable gentlemen and would scorn to give false pedigrees or substitute one animal for another. Naturally each thinks his s'ock is equal to the best, if not actually of superior merit.

Morals and Moralizing from Maryland.

Dual-Purpose Calves.

ED. HOARD'S DAIRYMAN:—Prof. Shaw's able defence of the dual-purpose cow reminds me of a case in my own experience, and an item that recently appeared in the *Baltimore Sun*, concerning Mr. Charles Councilman, of Baltimore county. By way of experiment, Mr. Councilman purchased a grade Hereford calf for seven dollars at two months old, and at the end of two years sold him for $75. When I was a boy my father kept Jersey cows, and bought steers in the fall to fatten. The idea struck me of raising the bull calves from the Jersey cows and have a steer to sell without buying him in the fall. My father pointed out the objections of fattening a Jersey steer, but let me have my own way.

When the steer was sold at three years, he weighed nine hundred pounds, bringing five cents a pound or $45. The steer paid me, for my father let me have the money, and charged me nothing for the feed; but could there be a better argument for the dual-purpose cow? Mr. Councilman's steer, at two years, brought $75 and mine $45, or there is thirty dollars to the credit of the dual-purpose cow, and can any straight dairy cow beat it? At least that is what the dual-purpose man says.

But let us begin at the beginning with the calf. My calf was worth five dollars and Mr. Councilman's calf cost seven, and the dual-purpose cow had nothing to do with the subsequent values of the two steers. It is true that the calf of the dual-purpose Hereford had within it the possibility of yielding for its feeder $75 against $45 for the straight dairy cow, but this possibility of extra gain is recognized in the extra two dollars that the calf brought when it was sold as a calf. Ridiculous, that a calf which can yield its feeder $75 against another's $45, only worth two dollars more! True, but it is a fact; cold hard facts are what we deal with, and not theoretical fancies.

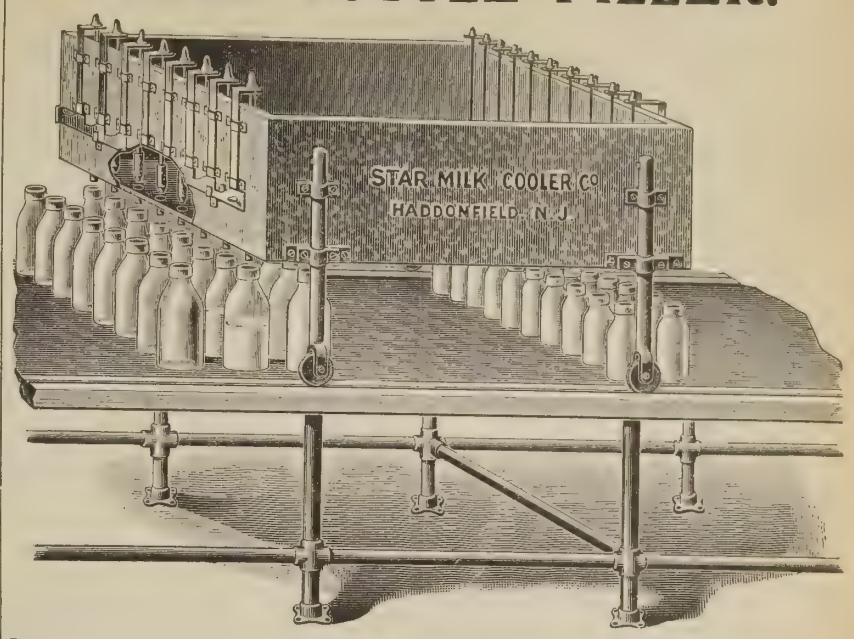
It may be reduced to an algebraic equation. The yearly excess of value of and the beef end of a dual-purpose cow is equal to the excess of value of her calf over the calf of a straight dairy cow. But to offset this, we must take into consideration the excess of earning power in milk and butter of the straight dairy cow over the dual-purpose cow. So long as I can buy a beef calf for my milk calf and two dollars to boot, I will buy them and keep my straight dairy cows

What becomes of the fellow who raises the beef calf? Well, there is no law that I know of compelling him to raise beef calves

Catonsville, Md. P. B. CROSBY.

PLUCKY WOMEN.

The farmers' wives, who make butter in Sangamon Co, Ill., held a very successful exhibit last winter at Springfield.



Mrs. Eva Springer is president of the association. We like this move, for it betokens energy and progress. If the wives of the country, who make butter, would take more interest in dairy education, it would help the cause wonderfully.

Cement for a Leaking Water Tank.

ED. HOARD'S DAIRYMAN:—During Oct., 1897, I had placed in the hay mow of my cow barn a water tank, six foot stave, eight foot bottom made of cypress lumber. It leaked as soon as I turned water in it, causing a nuisance in the first story of the barn, the water constantly dripping. After having the tank rehooped, and trying in many ways, for two months, I failed to stop it from leaking. I then emptied the tank, let it dry one day, got some Portland cement, made a wash about as thick as whitewash, and with a brush washed the tank inside, and let it dry during the night. The next morning washed it the second time, let it stand a few hours, then filled it with water. Have now been using it more than a year, and it has not leaked a drop. J. R HUSTON.

Dayton, Ohio.

STAR BOTTLE FILLER.

Pints and Quarts. No Rubber. DO YOU CATCH THE IDEA? Write for catalogue of Sanitary Dairy Apparatus and catch more ideas.

STAR MILK COOLER CO., Haddonfield, N. J.

STILL POND, MD., September 26, 1898.

MR A. H. REID, Philadelphia, Pa.

Dear Sir:—Early last summer we bought of you a Separator and Pasteurizer. We have found both machines give entire satisfaction. Every fall previous to this our customers have complained of butter tasting grassy. This season, notwithstanding the growth of weeds the pastures have had in them, we have not heard of a single complaint from our customers, and the demand for our butter now, is even greater than we can supply. We find the machine will do all you claim and we are very much pleased with it.

Very truly yours, STILL POND CREAMERY CO., JOS. W. HARPER, Treasurer.

A. H. REID, 30th and Market Sts., PHILADELPHIA and CEDAR RAPIDS, IOWA.

Michigan Feeding Problem Submitted and Discussed.

ED. HOARD'S DAIRYMAN:—The ration I am feeding is 4 pounds wheat bran, 4 pounds middlings, 4 pounds pea bran, 6 pounds clover hay and 30 pounds silage. Until recently we have fed about 35 pounds ensilage, 6 pounds clover hay and 6 pounds each of wheat bran and middlings. We continued the bran and middlings all through the pasture season, and after July 15th, also fed about 25 pounds clover ensilage. The rations were formulated without any knowledge of the constituents—simply guess work—and it is only of late that I suspected that my ration was not right. It was reading HOARD'S DAIRYMAN that caused me to have this idea, and I believe an investment of one dollar for HOARD'S DAIRYMAN will pay, at least, one thousand per cent.

I may say in regard to the cows, we have been culling out the poorest for the past five years, and adding others—some of our own raising, and others by purchase. Have had a Jersey bull at head of herd for some time, and last fall purchased Ida's Rioter of St. Lambert 21st, of Miller & Sibley. While I think the present herd may be better than an ordinary lot of farm cattle, I am quite sure they are not yet a money-making lot, notwithstanding the average yield of twenty-five cows and heifers, from April 8th, 1898, to March, 1899, was 6,408 pounds of milk, which sold for $60.39. The old herd are quite large cows, hence, the cost of keeping them is more.

I have ordered a lot of cotton seed meal. I had supposed it better than gluten meal, to go with clover hay and corn silage. I have also thought I might obtain a more profitable feed than wheat middlings, which cost $15 per ton, while bran cost $14.

St. Clair, Mich. C. F. M.

The ration now fed, set out in tabular form, shows the following figures:

	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
30 lbs. silage	7.92	.39	4.20	.21
6 lbs. clover hay	5.08	.41	2.15	.10
4 lbs. wheat bran	3.52	.50	1.54	.12
4 lbs middlings	3.52	.51	2.12	.14
4 lbs. pea bran	3.56	.29	1.32	.03
Totals	23.60	2.10	11.33	.60

As compared with the standards, the above rations are more or less deficient in every item for cows of large capacity, and especially so in protein. The former ration, where the grain was limited to bran and middlings, was much better, as it contained fully 25% more protein. Unless the pea bran can be bought for about half the price of wheat bran, we would advise discarding it altogether. The cotton seed meal can be used to good advantage, and we would increase the clover hay by two pounds or more, unless there is other roughage available at less cost.

Compare the totals of the following formula with those given above:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
30 lbs silage	7.92	.39	4.20	.21
8 lbs. clover hay	6.78	.54	2.86	.14
4 lbs. bran	3.52	.50	1.54	.12
4 lbs. ground corn	3.59	.32	2.67	.17
2 lbs. cotton seed meal	1.84	.74	.34	.18
Totals	23.62	2.49	11.61	.82

If any changes in the kind or amount of feed are determined upon, they should be made very gradually, and this especially in adding cotton seed meal.

We think it might be said in this connection, that an average cash income of $60 per cow ought to afford a fair margin of profit. If it does not we apprehend the reason is to be found in injudicious feeding—such as giving too much grain in summer, or to cows that do not make a proper return for it, either for lack of dairy capacity, or by reason of advanced lactation.

Ripening Cream in Winter.—Paper Butter Boxes.

ED. HOARD'S DAIRYMAN:—I notice you ask for methods of ripening cream in winter. I find no more trouble in winter than in summer, since I adopted the following plan:

I made a box 21 inches square by 2 feet 8 inches long, set on legs 12 inches long at one end and 13½ inches at the other end. This box is painted inside and out with floor paint. The inside is lined with galvanized iron, made water tight. The lining only comes up a foot, as that is as high as it is necessary for the water to come.

On each side or this box, near the top, there are six one-inch holes to let in air, and a thin piece of wood with a screw at one end that can be turned over the holes to keep out the air.

Inside of this box there is a tank for holding the cream, made 6 inches smaller then the box each way. A frame is made out of 1× 3 inch, the sides, just to fit length of box inside, and the ends are checked into the side pieces, 3 inches from the ends and nailed.

The cream tank just fits inside of this frame, and the top of tank is turned over and tacked down to this frame. The bottom of the tank is V shape, just enough to let the cream all run to the center when drawing it out. Three pieces of board are cut to fit the bottom of the tank, 2 inches wide in center; they are cut to fit inside of box, and on them the bottom of tank rests. A nail driven from outside of box into ends of frame holds the top of tank in place. A pipe at bottom of cream tank, with a syrup cock to draw off cream, and a cock for drawing off water, both at low end of box.

The cream tank is covered with cheese cloth, pinned over a light frame, this admits of air, but keeps out flies and dust. Over the box is a cover of one-inch lumber. When separating is done, and the cream is cooled, it is put in the tank in warm weather surrounded with cold water; in cold weather it will keep without, till time of ripening, when it can easily be brought to ripening temperature with warm water.

So much has been said about this matter of ripening, that I will not go into the details, but will just say the secret of the whole matter is to have control of temperature, and so far I know of no better plan than the one I have tried to describe.

This tank is larger than is required for the size of churn. I use No. 5 barrel churn; will hold two churnings. We have two of these tanks; they take up more room than a size that would just hold a churning, but are easily moved on casters, and otherwise are entirely satisfactory.

I was much pleased with the letter of Mrs. F. J. Peters. I admire the way she has kept improving and trying to save labor, but there seems to be one thing lacking in her dairy, that is the folding paper box for the prints. These boxes cost, laid down here, half cent each, and are a great protection to the butter. Keep the parchment paper close to the butter, and saves the butter from getting dinged when handling; printed with name and address. If Mrs. Peters will try these boxes, I think it will be a step nearer the top.

Assa, Can. A. N. LE CAIN.

Routine of Farm Work.—Criticism Wanted.

ED. HOARD'S DAIRYMAN:—I would like to have you, or some of your readers, discuss the best routine of work for taking care of a herd of cows on a farm, where a great deal of farm work must be done besides. I will give our method to be criticized, as I am not very well satisfied with it, though hardly see just how to do better.

We get up at 5 o'clock in the morning, and go at once to the barn. First thing, we feed the cows a light feed of sorghum hay, and then go to milking. We have thirty cows and three men. Our separator is in the barn and is run by treadpower. By the time we are through milking we are nearly done separating.

One man goes and feeds horses and other stock, one feeds calves, and the other cools and puts away the cream. By this time it is a little after seven o'clock, and we go to breakfast. Immediately after breakfast, the cows are fed ensilage and grain, and left quiet until 10 o'clock, when they are turned out to water and stables are cleaned.

If the weather is fine they are left out until feeding time at night, but if unpleasant are put back as soon as they seem desirous of going. This, of course, is watering but once a day in bad weather, but they will hardly drink oftener as they have to go twenty or thirty rods for water, which is always warmed in cold weather.

At 4 p. m., we commence feeding again. Feed ensilage and grain, and oat or clover hay. By the time this and our other feeding is done, it is 5 o'clock, and we go to milking again, which with calf feeding, etc., takes until 6:30 or a little later, when we have supper. This makes supper late, but as one of the men lives quite a distance from the

Farm Wagon for Only $19.95.

In order to introduce their Low Metal Wheels with Wide Tires, the Empire Manufacturing Company, Quincy, Ill., have placed upon the market a Farmer's Handy Wagon, sold at the low price of $19.95. The wagon is only 25 inches high, fitted with 24 and 30 inch wheels with 4 inch tire.

This wagon is made of best material throughout, and really costs but a trifle more than a set of new wheels and fully guaranteed for one year. Catalogue giving a full description will be mailed upon application by the Empire Manufacturing Co., Quincy, Ill., who also will furnish metal wheels at low prices made any size and width of tire to fit any axle.

For Sale At lowest prices two Jersey Bull calves six and eight months old, and very well bred. For particulars Address

THE JERSEY BULLETIN, Indianapolis, Ind.

barn, we do not see how it can be avoided very well. It also makes a long day's work.

Would it be advisable to milk an hour earlier at night, thus making the night two hours longer than the day? If we were to do so, I do not see how we could get anything at all done in the afternoon, as we would hardly get started before it would be time to feed, and all hands must be there to milk.

There are a number of objections to our method of feeding, such as feeding ensilage and hay just before milking, but if not fed until afterwards, it makes it that much later, and besides must all be done by lantern light, which is inconvenient and dangerous. Hope to get some light on the subject, as I always look to the DAIRYMAN for help in difficult places and generally get it too.

Calhoun, Mo. H. C. G.

Waste of Skim Milk.—Effect of Abortion.

ED. HOARD'S DAIRYMAN:—I would like your estimate of the loss to patrons of a creamery (nearly 100 of them) that handles over thirty thousand pounds of milk a day, and only one tank for skim milk, which is never empty, and, of course, can never be cleaned out. The milk gets terribly sour, and many hogs die and others run down so they are very poor and sick and almost die. Ought there to be two tanks, so that one can be cleaned every day?

I have had some trouble with cows aborting the past year and failure to breed, and one of our large dairymen says that he has practiced opening them up, that the womb entrance is so tight closed that the bull cannot serve them to do any good.

Does Dr. Horne think he is right in the matter? Two of my cows that aborted last had terrible itching about the tail, and a ring of skin, round the roots of the tail, came off after a while; what is the cause of it?

Vermont. AURELIUS SYKES.

A definite estimation of the loss that may result from such practices is, of course, impossible. The results from dead and sick animals, from other losses, due to deficient vitality of young, and slow growth of fattening animals are too indefinite to estimate with accuracy, although it is evident that in a year such losses must amount to a large sum. Taking the milk alone, the loss is sufficient to wonder why the patrons permit such a state of things to exist. Thirty thousand pounds at a feeding value of 20 cents per hundred is equal to $60 per day. This amount of milk is allowed to become worse than useless, in fact, dangerous, as a feed. The small expense that would be necessary to clean the skim milk tank daily, outweighs the value of the milk, which is allowed to become a constant source of loss to every patron of the factory. Of course, there should be two tanks for the skim milk.

The question of whose duty it is to keep the tank clean should not be discussed. If the operator of the creamery will not do it, the patrons themselves should make suitable provision, and see that the milk is kept in a proper condition for feeding. Such waste furnishes a very obvious answer to the complaint that, "dairying don't pay."

We know of no hundred patrons in this or any other locality that can afford to lose the above amount in skim milk, daily. It is just as much a direct loss as if the money was taken from their pockets, directly. And we will venture to assert that the majority of them "cannot afford" to take a dairy paper. If they did, the above conditions would be different.

Dr. Horn answers as follows:

All wombs should be closed, excepting at a certain time; opening has ruined hundreds of the best cows in the country. There are many causes, local and otherwise, for the scaling off of the skin, as named.

Model Cow Stall.

ED. HOARD'S DAIRYMAN:—In answers to your correspondant's call, for a plan of a good cow stall, I wish to break a lance for "Hoard's model stall." The last winter I spent in Canada, I originated a very similar arrangement for my young stock, and I concluded to change the cow stalls next season, improving upon the first attempt. However, I sold out.

In California I was only a renter; but on my last place I had to put up my own stalls, which I modeled, as closely as I could, to the sketch in HOARD'S DAIRYMAN. For reasons of economy I had to use inch boards for the rear foot plank, and, therefore, could not spike down the 2×3.

I sloped the whole barn floor, which gave my drop an even depth of three inches. At intervals I ran lateral drains, which successfully carried off the liquids. The walk behind the cows, and the stall floors were gravel and loam, and I had no trouble in keeping them dry. I had a permanent chain around my cows necks carrying a swivel ring at one end. A short chain with a plain snap hung from the center of the neck. The swivel was as convenient for holding a leading strap as well.

I saw the Scott stall used in a very fine barn, but I did not like it as well as the model stall. I intend, when building the next barn, to have a continuous feed trough under the rack, with a design similar to the Scott trough for feeding through. If necessary swinging shutters can be hung between the stalls to keep the cows from getting their neighbor's feed.

This trough can be made water tight, and cannot only be easily swept out, but the water can be run through it at will, to water the cows; thus thoroughly cleaning it. I never had a stall to please me as well, and with the strip nailed down it must be perfect. I had a window cut in the wall behind the cows—the manure was carted away—outside of which the star cooler hung above the milk can. Next to this was a shelf for scales, book and sample bottles, and as the milk was drawn, it was weighed and cooled ready for delivery.

I kept my cows in, almost every night in the year, and the good effects of a comfortable warm place and feed were very noticeable. Strange to say, I drew milk for a neighbor, who kept three fine Jerseys in a barbed wire fence lot of about 20×40 feet square. They had a kind of stanchion arrangement to feed through, and alfalfa hay *ad libitum* was all they got from one month to another. no shelter, no change, always there. They had a never failing supply of hay and water, but no other care or cleanliness, and yet they always looked well, and tested 5% month after month. Strange, passing strange, is it not?

Ruskin, B. C. DANIEL F. BOISSEVAIN.

Results of Six Years' Experience with the "Dairyman."

Herd of Twelve Cows, Five of Them Heifers with First Calf, Average over a Pound of Butter per Day in March.—The Breed and the Feed.

ED. HOARD'S DAIRYMAN:—I have been a subscriber to your paper for some five or six years, and I like it very much. Like it so well I could not do without it while keeping cows. At present we are milking 12 cows, 1 of which is ½ Jersey, the rest are ¾ and registered Jerseys. These 12 cows have made from March 1st, 1899, to March 20th, 265 lbs. butter salted and worked ready for delivery. Five of these cows are heifers with first calf, rest are older cows.

I use a U. S. Separator No. 5, a 20 gal. Boss Barrel Churn, and an Imperial Philadelphia Butter Worker, also a Eureka Printer. Deliver butter to private families at stated price the year round, also ship to Pittsburg by contract.

I am feeding at present 3 lbs. ground corn and oats, 2½ lbs. heavy winter wheat bran, 1 to 1¾ lbs. O. P. oil meal. This is one feed, not a day's ration; also feed all the hay they will clean up mor ing and evening. Hay is ¼ clover and coarse timothy.

I have my own engine and mill, do my own grinding, also some custom work. Otherwise I would have to haul my feed 5 miles to get it ground the way I want it and then pay 8 cents per 100 lbs. I grind 2 bushels shelled corn and 2¼ bushels oats.

Bran costs $15.00 per ton
Oil meal $1.45 per 100 lbs.
Corn is selling at $.40 per bushel
Oats about $.30 per bushel

Please tell me what you think of this ration, and suggest any change that might be for the better. How shall I feed during spring and summer? I have always fed during summer. Hoping you will see fit to answer this scratch of a letter through the columns of the DAIRYMAN, I must close. "Long live the DAIRYMAN" J. M. W.

Washington Co., Pa.

We are free to say that it seems to us that the man who can submit such a report as the above, has passed the point where specific advice as to kind and amount of feed is required. Making the usual estimate for heifers J. M. W. is milking the equivalent of 9½ cows and getting an average yield of something more than 1½ lbs. of butter per day, and, although feed is very dear, these cows are returning him fully twice as much as it costs to feed them. This cost might be cheapened somewhat, possibly, by substituting 1½ lbs. gluten feed for the 2½ lbs. bran and, unless necessary for dietetic reasons, we should feed less of the expensive oil meal. Do not let down too much on the grain until the cows get good pasture, and then taper off gradually until only the corn and oats mixture is fed and but little of that when the pasture is at its best We also advise giving the cows a good bite of hay every day through the summer. They relish a little dry fodder and this is sufficient justification for giving it to them, without inquiring too searchingly into the whys and wherefores.

An Explanation.

ED. HOARD'S DAIRYMAN:—In my article published in DAIRYMAN of March 1st, in saying, as I intended, that the dairy calf weighed 140 pounds, at three weeks old, I intended to convey the thought that the dairy calf is not necessarily light. While I admit that the calf mentioned was sired from a beef breed, yet the little heifer that brought it possessed those high maternal qualities, as taught by the DAIRYMAN, making her capable of bringing that kind of a calf, as well as of feeding it in the severest winter weather. To illustrate what I mean: A butcher in passing my cows (among which was this same little heifer) said to me: "I want your veal calves; your cows are of that open make that will bring good calves."

Ohio. N. E KIMBALL.

Butter Questions Answered.

ED. HOARD'S DAIRYMAN:—Rose Seeley Miller requests practical makers to answer her questions on exact temperatures for churning and ripening cream: a difficult feat, and were I to offer to do so, it would be because "fools rush in where angels fear to tread". The rules laid down for butter making will not amount to much benefit, unless the principles underlying them are thoroughly mastered. It is a complicated industry; so many idiosyncrasies that it not only requires mere mechanical ability and skill, but also a broad comprehension of the process of fermentation, which involves a thorough grounding in bacteriology.

"Tell us just how to ripen the cream". The answer is in several chapters of "Woll's Modern Dairy Practice" and in "Russell's Bacteriology", two invaluable volumes, and no less is that of Prof. Farrington on Milk Testing, etc., which tells us *exactly* when the cream is ripe for churning. We sometimes are out-classed by wise men, who know beyond the peradventure of a doubt when the cream has developed the necessary amount of acid to aid in a uniform butter flavor, and for an exhaustive churning—a class that is causing us a national loss of millions of dollars a year, through churning at improper temperature and improper ripening of the cream.

The 66° stated, by W. C. Rockwood, for temperature of churning Jersey cream, gravity system of creamery, or 16 to 20% fat, is correct for cold weather, and for the viscid condition of the milk serum, generally met with in cows of advanced lactation. Such butter is harder, and can be worked at a higher temperature. Still it would not be an invariable rule, because what will happen one day may not happen the next.

We cannot churn 20% cream at 53°, but if churned at 60°, with ripened cream of .6 or .7 of 1% acid, you will have fair results in buttermilk. To improve on this and have a better body to the butter, not so soft or greasy, cool it down when ripe to 56°, for at least half an hour, and churn this kind of cream at a temperature and in a room of 60° and have good results. Were we to churn at 53°, it would be churn, churn, churn all day. With thick cream of 30 to 40% butter fat, ripened to .45 and churned at 52°, will give us thin butter milk. This is the temperature of the butter milk at the close of churning.

The best and safest rule I have is what I learned from Dr. Babcock, of your Experiment Station, to an audience of Wisconsin dairymen, when the question "What is the best temperature for churning?" was answered by the doctor as follows: "The rule I give you is to churn at as low a temperature as possible and have the churning completed in not less than 30 minutes".

Many times I have been consoled by that rule, because it is impossible to have the same churning temperature under all conditions; so many of them.

It changes with advancing lactation, because the liquid acid—those volatile fatty acids you mention in last issue—diminishes as the period of lactation advances, and a higher churning temperature is more necessary in winter than in summer.

Thus we learn some of the conditions that influence the time required to churn. Condition of cream, thick, thin, ripe, speed of churn, feeds, temperature, which are learned by actual experience. In churning sweet cream, we have to get the cream as thick as possible. The latitude of churning then appears as follows: HOARD'S DAIRYMAN, 48° to 54°; Prof. Robertson, 54° to 58°; Prof. Stewart, 55° to 65°; the Danes, 50° to 54°.

In raising the temperature to churning point, with evenly and properly ripened cream, we do not raise the temperature by adding hot water, as that reduces it to thin cream, and renders its churnability more difficult, and also slightly increases the loss of fat in the buttermilk, and increases the quantity of buttermilk. The conditions favoring high efficiency in churning are low temperature, slow motion of churn, ripe and thick cream, and right viscosity of serum; the objection to churning only 15 minutes is soft butter, rich butter milk, and a poor butter maker; in a factory of, say, 700 pounds of butter fat per day, as much as 30 to 40 pounds of butter fat is lost, if run by incompetent operators!

When are we to have a standard of examination for butter makers?

Brine salting: "Tell us how warm to make the brine." My practice was 40 to 45 degrees in hot weather, and 50 to 62 degrees in winter. "How strong?" That's a stickler which I cannot answer. My practice, however, was 5 pounds of salt to 13 gallons of water to suit the English taste of a very mild salted butter. That will not answer where 1¼ ounces per pound are demanded. I abandoned brine salting long ago, as impracticable, as it required more skill than I possessed to put in brine enough to give the right savor, and to retain the right quantity of water after it was washed, which should be 13%.

When the granules were very fine there was more of the brine incorporated with it, and if the granulation was coarse I did not get so much salt, and consequently amount of brine or the number of times it was applied required nice judgment to get a uniform salting from day to day. The granulation ought to have been the same size, and butter the same temperature. It created more work and required a much larger use of salt, besides the fact that it can only be salted to a slight degree and impracticable for those requiring more than 1 ounce to the pound.

Working the butter "once or twice?" I work twice with judgment. My churning is done right so that at the first working all superfluous butter milk is off, leaving sufficient, however, to dissolve the salt, and at the termination of 30 minutes, re-work for the necessary smoothness and solidity, and to print easily and firmly. There should be great importance attached to the solubility of the salt; there is a vast difference; they are pure enough, but some men, as Prof. Robertson, who work twice, are shrewd enough to pay great attention to the quality of salt. Where a hard, crystalized grain is used, not easily soluble, some 3 or 4 hours may elapse before it is sufficiently dissolved to be safe for second working.

Mr. Gurler employs artists who work but once. Some of the Danes work once, but I notice it is at the expense of grain, as they are just as much afraid of mottles and wavy lines as we are.

Judgment is used and the following conditions which influence the amount of working, are observed: Temperature, consistency of the butter, and amount of butter milk in the butter.

Tell us at what temperature butter keeps best and longest? intact Forty degrees F. and below; room should be clean and sweet, and the butter in good condition and properly made. THOS. DIXON.

New York.

A Massachusetts Milkman on the Wrong Track.

Submits a Series of Questions.

ED. HOARD'S DAIRYMAN:—As I am a new subscriber to your valuable paper, would like to bother you with a ration formula, and other questions. I know I could get this information in future issues, but as I am on the wrong track cannot wait.

Milk a herd of eighteen cows, and at present feed the following rations: Four pounds wheat bran, 4 pounds mixed feed, which consists of 4 parts corn and cob and 1 part rye by weight, ground together. This amount is fed to each cow per day, in two feeds, the strippers getting the same in quantity as the new milkers. For roughage feed timothy, herds grass, and rowen hay. Very little of it has a light sprinkling of clover. This is fed three or four time a day, about all they will eat clean. The last thing at night, we feed corn stover. We have on hand, cotton seed meal and gluten feed, but am afraid to use much of it, as we have two or three cows that occasionally have garget, thinking that too much grain may be the cause. Get a fair flow of milk, but it only tests from 17 to 18% cream, tested in glass milk tubes.

We run a milk route, and in the spring and summer, when our herd is in pasture, everybody praises the quality of milk, but in the winter complain of lack of cream. Our herd consists of scrub cows of good size.

QUESTIONS.

1. Formulate an average ration from the

Always Use the BEST.

The temptation to try a cheaper article in manufacturing high grade goods is such that the experiment is often undertaken and results generally in producing an inferior article.

High grade butter needs the best of appliances and skill and particularly the best Color.

WELLS, RICHARDSON & CO.'S IMPROVED BUTTER COLOR

has maintained its reputation as the best. It is always reliable and gives the true June shade.

"THE KIND THAT HAS NO MUD."

BUTTER SALTED WITH

WORCESTER SALT CO., No. 168 Duane St., NEW YORK.

ILLUSTRATION.

SYRACUSE HIGH FRAME SPRING TOOTH WHEEL HARROW.

The new Syracuse Wheel Spring Tooth Harrow, which is shown in the above cut without the seat attachment, has the following meritorious features:

1st—A Frame of channel steel carried at such height from the ground on high wheels as absolutely to prevent loading.

2nd—Adjustable Spring Steel Teeth of improved shape, which while having good suction, do not accumulate trash.

3rd—Broad Faced Steel Wheels with dirt proof bearings, and so made that by the removal of two bolts, new hubs with removable boxes can be quickly substituted. The wheels are so placed that there are no wheel tracks.

4th The entire weight of the driver, together with nearly all that of the Harrow, is carried on the Wheels which greatly reduces draft. The Frame works independent of the wheel axle, which is hinged in the centre and so allows the Harrow to conform to the uneven ground.

5th Cast Steel Shoes adjustable to depth, placed in front, which move always along in the line of draft, steady the running of the harrow and also prevent it from working downward when used on sidehill or rolling land. The Harrow is quickly and easily turned at corners without buckling, making it unequalled for transportation or use in the field.

6th—More or less weight can be carried on the front Shoes by raising or lowering the draft clevis.

7th—Easy and adjustable Spring Seat with convenient foot rest, furnished when ordered.

8th—The Levers are within easy reach of the driver, and the harrow can be dumped with the freedom of a horse rake without dragging the load.

9th—Additional sections can be added at any time, making an extra wide harrow, or a single section with nine teeth can be used as a one-horse Harrow.

2 Section Harrows with 15 and 17 Teeth.
3 Section Harrows with 22 and 25 Teeth.
With Plain or Separate Points.

SYRACUSE CHILLED PLOW CO., SYRACUSE, N. Y.

following feeds: Roughage; timothy, herds grass and rowen hay and corn stover; grain; mixed feed composed (four parts corn cob, one part rye by weight, ground together) wheat bran, gluten feed, cotton seed meal.

2. Formulate a ration of as many of the above feeds as you wish, with oil meal.

3. How high priced oil meal per ton, would you consider most advantageous for feeding, or rather, the highest price one could afford?

4. We raise 300 or 400 bushels rye. Would you feed it or sell it for 45 cents per bushel, which is all we can get?

5. Just tested a can of milk brought back from route, and only shows 11% cream. Same tested before it went out 18%. Is this due to milk being chilled?

6. What is the best way for exterminating lice from cows?

7. Will hen lice flourish on cows?

Mass. RATION.

If this "new subscriber" had considered the relations between an editor and some thirty thousand or more readers, he would have realized the impracticability of propounding so many queries in one communication, with the expectation of having them answered with anything like satisfactory fulness.

Timothy and herds grass are only different names for the same thing, unless there may be some local distinction. Rowen is of such variable quality that it can not be set out in a tabulated ration with any certainty.

We incline to the opinion that an allowance of 4 pounds bran, 4 pounds corn and cob meal, 1 pound gluten feed, 1 pound cotton seed meal and 1 pound oil meal—11 pounds in all—would be none too much grain for the fresh milking cows, if of fair dairy capacity. With such cows, the more you can get them to eat, within reasonable limits, the more profit will they yield. In connection with the grain, give them all the hay and stover they will eat. The amount of grain fed to strippers should be decreased from time to time, as they fall away in yield. When a cow commences to turn her feed away from the udder, it is time to give her less.

There is hardly any limit to the amount one can afford to pay for oil meal, if the condition of the cow seems to demand it. Oil meal is a gentle laxative, and when the bowels are semi-costive, the droppings hard and dry, enough oil meal, or other laxative feed should be given to overcome these conditions.

Rye at 45 cents per bushel will cost $17 per ton when ground, and would be worth less than bran for feeding with timothy hay and corn stover for roughage.

Cream will not rise readily or thoroughly on milk that has been stirred or otherwise agitated. The milk is probably just as rich in winter as in summer, but the cream is not as yellow, and does not separate as readily. It is, therefore, less noticeable.

For lice on cattle see extract from a Kansas Bulletin, elsewhere in this issue.

Newspaper Farming.

A Successful Dairyman Gives His Views.

ED. HOARD'S DAIRYMAN:—I was much interested in the article "The Kind of Farming That Does Not Pay", found in HOARD'S DAIRYMAN of February 3d, page 1,035. A similar failure occurred under my personal observation; in fact, the most noticeable failures among farmers have been those who had help from their fathers, so thought it not necessary for them to work and plod the slow ways their fathers did. Because of these failures, some older farmers call it newspaper farming, and say it does not pay.

The early settlers, who cleared their farms and received the benefit from decayed leaves and wood that had fallen for centuries did not need to read to know how to grow crops. Heavy hay could then be cut by sowing a little grass seed upon the ground, whether plowed or not. Sometimes, even without sowing any seed, as grass was a natural product of this soil. Now we are obliged to cultivate and fertilize often and thorough, which compels us to study ways and methods.

Allowing that all farming, not done in the old way, is newspaper farming, even then it is not the fault of the writer as much as those who read.

Many are endeavoring to follow certain plans, without considering the difference in soil, distance from market and personal fitness for that particular work.

A man located near a railroad, selling milk at 3 cents per quart or butter at 25 cents per pound, or keeping blooded stock, calves selling at $25 to $100 each, can afford to buy plenty of bran and grain, while a farmer situated so as to haul bran 11 miles, with team, and sell butter at average of 17 cents per pound, and cows $25 to $30 apiece, must raise most of his feed upon the farm.

Eight years ago I bargained to pay money rent for a farm near my small one. I began with the theory that considering the distance from railroad, and only one mile from a good co-operative creamery, owned and managed by strictly honest and reliable men, also having poor soil to deal with and a personal liking for cows, that I would depend upon them for my yearly income. The first two years I bought considerable bran, hay and meal; the third spring it cost me $80 to get my cows through to grass, for hay alone. By thus doing, I soon found with large quantity of stable manure, using some commercial fertilizer, having less land in pasture and following more thorough tillage, could keep more stock, feed liberally all the year, and have hay left instead of buying.

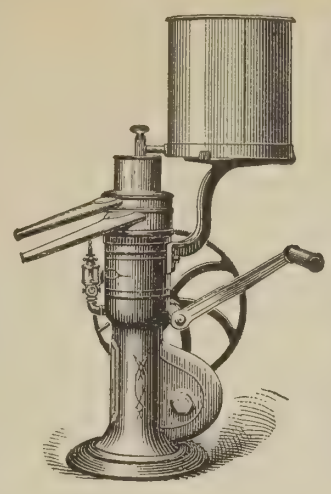
Am now keeping ten head more cattle, and two more horses than the first year, with ten tons more hay than will feed, besides raising 600 bushels potatoes more than the first year, but with twenty acres more ground.

My plan of soiling in connection with pasturing, is to feed cows hay during the spring, as long as they will eat it, then cut early grass followed by timothy and clover, oats and peas, millet, Hungarian grass and corn fodder, fed each night in stable. An early piece of rye to turn into is helpful during June; then plow the ground for fodder corn. Ensilage would be more convenient to feed during busy season for those who have silos.

I am often asked, "does it pay"? and some remark, "he is trying newspaper farming and it does not pay". Well, I cannot boast of large surplus, having made improvements and purchased new machinery to the amount of $500, and lost $200 worth of stock, with hired help costing about $300 per year for the eight years, meanwhile paying rent on land. Yet I fully believe in farming as a science. We must read and study, if we as farmers expect to succeed.

The Chautauqua course of reading in Agriculture, furnished by this state is a very helpful source of knowledge, with but little expense. As farmers, we should put into practice the thought that life does not consist entirely in the number of dollars saved, but by intelligent tillage of the soil, by kind treatment to the animals on the farm, by honest dealings and pleasant words for our neighbors, establish character that will last longer than money in a bank.

Orwell, Pa. INGERSOLL.



Skim Milk Worth 40 Cents per Hundred.

ED. HOARD'S DAIRYMAN:—An experiment at the Kansas station, completed February 24th, with three lots of pigs of six each, shows excellent returns from feeding skim milk, as compared with alfalfa and cotton seed meal.

They were fed all the ground kafir corn they would eat in addition to the other feeds. The skim milk lot ate 40 per cent more grain and gained 2.43 pounds per day each, against .88 pounds for the alfalfa lot, and .95 pounds for the cotton seed meal lot.

In twenty-two days, lot 1 ate 629 pounds ground kafir corn and 250 pounds alfalfa; lot 2, 588 pounds kafir corn and 93 pounds cotton seed meal; lot 3, 860½ pounds kafir corn and 1 685 pounds skim milk. Placing the cost of alfalfa at $6 per ton, this makes cotton seed meal worth $27.80 per ton and skim milk 40 cents per hundred.

At the ordinary price of alfalfa, $3 per ton, skim milk would be worth 20 cents per hundred. This experiment was in process during the extreme cold weather of February. ED. H. WEBSTER.

SEARS, ROEBUCK & CO., CHICAGO, ILL.

Keeping Milk in Summer.

During the summer of 1898 the milk from the college herd of thirty cows was sent to the Manhattan Creamery. Our object in sending the milk to the creamery instead of making butter was to test how cheaply milk could be handled and yet be delivered in good condition, and how few and cheap things could be used to keep milk sweet for a sufficient time so that Saturday night's and Sunday morning's milk could be delivered in good condition on Monday. Many creamery patrons are unable to keep milk sweet longer than eighteen hours, and either feed the milk of Saturday night and Sunday morning or else set it and make butter for family use. They are not properly equipped for making butter and most of them do not secure nearly all the butter fat from the milk; while at the same time, as it only comes once a week, the work is a nuisance.

If milk can be kept sweet at a reasonable cost from Saturday night until Monday morning, those who live at a distance from creameries can hold their milk and deliver every other day, saving half the expense of hauling. Creamery men told us that if we could make alternate-day delivery of milk practicable for farmers with little money, a large amount of milk could be secured for creameries and skimming stations in the newer dairy distrtcts where the amount now secured is not sufficient to make the business profitable.

The Manhattan Creamery is one and a half miles from the college dairy, and our milk was hauled to the creamery by a neighboring farmer who handled a milk route, the college milk receiving exactly the same treatment while on the road as that given the milk from the neighboring farms.

We had a creamery room which cost us $100 and was fitted with a cement floor and ice box; but farmers who had difficulty in keeping their milk said that they no had such a place and that the average farmer could not afford such an expense. At the beginning of hot weather we therefore abandoned this room and built what one of our farmer boys called an "every-farmer-can-afford-it" milk house. We set some posts and nailed to them old fence boards making a room 10×10×10 feet, with a dirt floor. As the old boards could not be set close enough to keep out either sun or rain, we covered them with building paper. This building, if made of new material, would not have cost over $10 and did not cost us over $5. The room was built around a well. We had a windmill, but did not use it as we wanted to keep milk under conditions where a farmer could not afford one. For tanks in which to set the cans of milk we used oil barrels, sawing them in two. We also took a half barrel and boxed it in, packing the spaces with wheat chaff. This box was covered with quilts made from bran bags.

In handling this milk the care was taken that previous experiences had taught us was necessary for keeping milk under any conditions. Every utensil, touched by the milk was thoroughly washed, and then sterilized with scalding water. If even a small quantity of dirt is left in the seams or corners of pail, strainer or can, it supplies an abundant source of the bacteria which cause milk to sour. No matter how clean the milker's hands seemed to be, they were washed in hot water just before milking to destroy all milk-souring germs, that might be in the dust or dirt on them. The sanitary milk pail was used. This pail has a cover into which a 6-inch opening is cut. In this opening fits a removable strainer. The milk is milked directly into the strainer, and the cover keeps out of the milk the fine dust which falls from the cows body during milking. This dust is full of the bacteria which sour milk. When the milker sat down to milk, he wiped the cow's udder with a damp cloth, to remove as much dirt as possible and dampen the rest so that it would adhere to the udder and not fall into the milk. The milk was strained into forty-quart cans, and as soon as a can was filled, it was taken to the milk room, where it was immediately cooled to 60° to 62° by passing over a milk cooler. The cans containing it were then placed in the half barrels and these barrels filled with freshly pumped water and barrels and cans covered with bran bags. The water was changed morning and night. With this treatment, and without ice, milk was kept and delivered regularly through our hottest weather in good condition to the creamery when forty hours old, the time required to hold Saturday night's milk for Monday's delivery at the creamery; and much of the time we were able to keep the milk in a good condition fifty-two hours, the time required when Saturday morning's milk is kept for Monday's delivery.—H. M. COTTRELL, in the *Industrialist*.

Short Course in Agriculture, University of Wisconsin, Madison.

Prizes and Medal Awards.

The following prizes and medals were awarded recently by the College of Agriculture to the students showing the greatest degree of proficiency in various lines of agricultural work in accordance with announcements in Short Course circular and elsewhere:

Ogilvie Gold Medal—Value $75. Awarded to the Second Year student attaining the highest average in all classes of live stock judging; given by R. B. Ogilvie, Trevor, Wis.; won by Sylvester Lynch, Augusta, Wis.

Hoven Gold Medal—Value $100. Awarded to the Second Year student showing the greatest proficiency in judging fat stock; given by M J. Hoven, Madison; won by J. M. Wagner, Hillsboro, Wis.

Hoven Silver Medal—Value $10. Awarded to the Second Year student showing the greatest degree of proficiency in judging fat stock; given by M. J Hoven, Madison, Wis.; won by James Bagnell, Pewaukee, Wis.

HOARD'S DAIRYMAN Silver Medal—Value $10. Awarded to the Second Year student showing the greatest proficiency in judging dairy cows; given by HOARD'S DAIRYMAN, Ft. Atkinson, Wis.; won by J. M. Wagner, Hillsboro, Wis.

Everett Silver Medal—Value $10. Awarded to the Second Year student showing the greatest proficiency in judging beef cattle; given by C. H. Everett, Beloit, Wis.; won by William C. Miller, Center, Wis.

Briggs Silver Medal—Value $10. Awarded to the Second Year student showing the greatest proficiency in judging horses; given by H. A Briggs, Elkhorn, Wis; won by Eugene Holston, Ashland, Wis.

McKerrow Silver Medal—Value $10 Awarded to the Second Year student showing the greatest proficiency in judging sheep; given by George McKerrow, Sussex, Wis; won by A. G Main, Appleton, Wis.

Jones Silver Medal—Value $10. Awarded to the Second Year student showing the greatest proficiency in judging swine; given by Hon W. A. Jones. Washington, D. C.; won by P. V. Becker, Glasgow, Wis.

Wisconsin Agriculturist Silver Medal—Value $10. Awarded to the First Year student showing the greatest proficiency in plant life; given by the Wisconsin Agriculturist, Racine, Wis.; won by Willard Abbott, Appleton, Wis.

Hill and Gillett Silver Medal—Value $10. Awarded to the Second Year student showing the greatest proficiency in judging Guernsey and Holstein cattle; given by Geo. C. Hill & Son, breeders of Guernsey cattle, and W. J. Gillett & Son, breeders of Holstein cattle, Rosendale, Wis.; won by A L. Andrews, South Wayne, Wis.

Scribner Silver Medal—Value $10. Awarded to the Second Year student showing the greatest proficiency in judging Jersey cattle; given by F. H. Scribner, breeder of Jersey cattle, Rosendale, Wis.; won by H. J. Lassell, Orfordville. Wis.

Complete Set of Works on Book-keeping and Commercial Law—Value $6. Awarded to First Year student showing the greatest proficiency in book-keeping; given by J. N. McCunn, President, and E. O. Folsom, Secretary, of the Green Bay Business College, Green Bay, Wis.; won by Roy Gordon, Mineral Point, Wis.

Ten Dollar Gold Piece—Awarded to Second Year student showing greatest proficiency in veterinary science; given by Henry Riedberg, Stone Bank, Wis.; won by Chas. Seaberg, Brodhead, Wis.

Five Dollar Gold Piece—Awarded to Second Year student showing the second greatest degree of proficiency in veterinary science; given by Henry Riedberg, Stone Bank, Wis.; won by A. L Andrews. South Wayne, Wis

Ten Dollar Gold Piece—Awarded to the Second Year student showing the greatest degree of proficiency in feeds and feeding; given by Prof. W. A. Henry, Madison, Wis.; won by H. F. Ross, Hinsdale, Ill.

Five Dollar Gold Piece—Awarded to the Second Year student showing the second greatest degree of proficiency in feeds and feeding; given by Prof. W. A. Henry; won by R. G. Griswold, West Salem, Wis.

Ten Dollar Gold Piece—Awarded to the First Year student showing the greatest proficiency in feeds and feeding· given by Prof. W. A. Henry; won by H. C. Bell, Leitersburg, Maryland.

Five Dollar Gold Piece—Awarded to the First Year student showing the second greatest degree of proficiency in feeds and feeding; given by Prof. W. A. Henry; won by Herman Hanchett, Sparta, Wis.

CONCERNING OUR ADVERTISERS.

That a large infusion of Jersey blood in the dairy herd will greatly increase its butter producing capacity, cannot be gainsaid. But it is generally difficult to secure, except by private contract, at prices beyond the average man's pocket-book, the kind of Jerseys, in performance and breeding, that will exert this influence on the herd. However, we wish to remind our readers that the public auction sale, advertised on another page, to be held at Indianapolis, Ind., April 12th, will present an opportunity to name your own price on a well bred bunch of fifty head, including seven cows with weekly butter tests up to twenty pounds. The breeding is strictly first-class and is shown up in a pedigree catalogue, which will be mailed to any reader applying to The Jersey Bulletin, Indianapolis. Ind. The contributors to the sale are reliable Hoosier Jersey Breeders, who credit their offerings with "dairy performance, dairy breeding and dairy form", three features consistent and essential in a profitable dairy animal.

Mr. A. G. Elliot, senior member of the firm of A. G. Elliot & Co., paper dealers of Philadelphia, died suddenly on the morning of February 25th at his home in Germantown, Pa. He was one of the most successful business men operating in his line in the east, and had established a trade extending to all parts of America. He was the originator of the plan of putting up butter in parchment paper packages, and his parchment paper has been used in nearly every creamery and in every butter-making district in North and South America, facilitating the preparing and shipping and general handling of this article. He recently made a tour through a large part of South America for the purpose of acquainting himself with the growing trade of that section, and as a result was an enthusiastic expansionist. He believed in extending the American trade to the remotest corners of the civilized globe.

The death of Mr. Elliot is a serious loss to the commercial interests of his city and is a great bereavement to his family and friends.

The paper business will continue under the management of Mr. Elliot's sons, who have ably assisted him for some years.

DON'T THROW AWAY AN OLD ACME HARROW.

"It is an implement that never wears out, viz: only the coulters wear, and they can be replaced at small cost,"

The Manufacturer will furnish Extra Parts for any "Acme" Harrow made since the beginning of the world, and at very reasonable prices. See advertisement in another column.

VETERINARY.

Two Wagons at One Price.

It is a matter of great convenience and a saving of labor for a farmer to have a low, handy wagon. They save more than half the labor of loading in hauling manure, hay, grain, corn fodder, wood, stones, etc. The man who already has a wagon may have one of these low handy wagons at the small additional cost for a set of wheels. These Electric Steel Wheels, with either direct or stagger spokes, with broad faced tire, are made to fit any axle. You can convert your old wagon to a low, handy wagon in a few moments time. You thus virtually have two wagons at one price. Write to the Electric Wheel Co., Box 130 Quincy, Ill. for their catalogue; which fully explains about these and their Electric Handy Wagons, Electric Feed Cookers. etc.

Parted In A Dream—(New) A beautiful song, very popular. Founded on strange incident of Cuban war. Regular price, 50c. Sent to our readers for 25 cts., post-paid, including also the complete words of DARLING LENORE and MOTHER'S DARLING YET.

Darling Lenore—(New) A very catchy, pretty song with beautiful flowing melody, all in waltz time. Becoming very popular. Regular price 50 cts. Sent post-paid to our readers for 25 cts. with words of PARTED IN A DREAM and MOTHER'S DARLING YET.

Mother's Darling Yet—(New) Very pretty and extremely popular with singers of lullaby songs. Regular price 50 cts. Sent post-paid for 25 cts. and with it the complete words of PARTED IN A DREAM and DARLING LENORE.

For 4 cts. I will send the complete words of the three songs with miniature page of music of each. Address the author,

HALBERT L. HOARD, Fort Atkinson, Wis.

How to Find Out.

Fill a bottle of common glass with your water and let it stand twenty-four hours; a sediment or settling indicates an unhealthy condition of the kidneys; if it stains your linen it is evidence of kidney trouble; too frequent desire to pass it, or pain in the back, is also convincing proof that the kidneys and bladder are out of order.

WHAT TO DO.

There is comfort in the knowledge so often expressed, that Dr. Kilmer's Swamp-Root, the great kidney remedy, fulfills every wish in curing rheumatism, pain in the back, kidneys, liver, bladder, and every part of the urinary passage. It corrects inability to hold water and scalding pain in passing it, or bad effects following use of liquor, wine or beer, and overcomes that unpleasant necessity of being compelled to go often during the day, and get up many times during the night. The mild and the extraordinary effect of Swamp-Root is soon realized. It stands the highest for its wonderful cures of the most distressing cases. If you need a medicine, you should have the best. Sold by druggists in fifty-cent and one-dollar sizes.

You may have a sample bottle of this wonderful discovery and a book that tells more about it, both sent absolutely free by mail, address Dr. Kilmer & Co., Binghamton, N. Y. When writing mention that you read this generous offer in HOARD'S DAIRYMAN.

YOUR LIFE and that of your family may depend upon the quality of your buggy and harness. When you buy a buggy, buy one that won't break. **This buggy is Guaranteed for 5 Years.** Every stick in the gear is hickory, tough as whale bone; every forging, best Norway iron. **Handsome as it is strong.** Trimming and painting, highest art known to buggy building. **An agent or dealer** would ask you $75. for one not as good. **OUR PRICE, $44.10.** **WE HAVE NO AGENTS** but sell direct to you at lowest prices. Shipped subject to your approval without any money with order. **Our line comprises:** Buggies, Road Wagons, Phaetons, Surries, Runabouts, Stanhopes, Spring Wagons, Road, Speeding and Breaking Carts, Farm Wagons, all kinds of Harness and Saddles. We issue the largest vehicle catalogue ever printed. Write us for it now. **IT'S FREE.**

No. 50 Buggy $36.50.

ing for past two weeks. The trouble now is in the joint, which is swollen and very painful. It hurts so badly that the calf can't bear to touch the foot to the ground.
Howel, Mich. J. M.

ANSWER.

Keep off the cotton and other wrapping, excepting a cotton bandage soaked in strong oak bark solution, and kept wet with it, if out of reach of frost. To each quart add half a pint only of acetic acid. Keep bowels constantly open with epsom salts, about two ounces, and a dram of good ginger; give warm when the inflammation is gone, not before. Paint over the joint with Gombault's Caustic Balsam, three or four times a day, for a while. When scab appears carefully wash it off, after being well soaked and softened. Then cover with clean hog's lard, until sore is gone. Then repeat, if needed, etc.

ABORTION.

We are troubled with abortion in cows in this neighborhood. I have lost fourteen calves and many of my neighbors have lost all. I think it is catching. Some say shock corn causes it; and others say salt, where they have free access to it. W. J. A.
Warren, Ill.

ANSWER.

You seem to have formed your opinion concerning cause and effect. Such conclusions are wrong. I have lately concluded to recommend some one of the advertised remedies. See the DAIRYMAN and use your own judgment in relation. This is the most rational and best course for you, as the components for abortion are dangerous and powerful medicines in the hands of the laymen, or any body else not thoroughly acquainted with drugs.

TUMOR.

I have a cow five years old. A few days ago, I noticed a bunch apparently as large as a hen's egg, in the vagina. It appeared to grow larger until yesterday I called in a veterinarian, who cut it out. He said it was a fibroid tumor. It was hard and should think would have weighed two pounds. The cow is due to calve soon. Will her milk be safe to use and will her calf be fit for veal? In other words, is or is not her system full of poison to cause the tumor? L. G. R.
Fortsville, N. Y.

ANSWER.

In all cases of constitution subject to tumefaction, there is a cause, which is not an indication of a pure, healthy organism, and though, perhaps, the milk may be much better than much sold on the market, it will not be equal in health to milk from an uncontaminated fountain. If hard as you say, you had not a case of fibroid tumor, but of an indolent tumor. Yes, the calf will be fit for veal so far as that is concerned.

OBSTRUCTION IN VAGINA.

We have a young Jersey cow, fresh with her second calf last November. She has been coming in heat irregularly ever since, sometimes going as long as five and six weeks between heats. She has taken the bull every time, but has failed to get in calf thus far, though we do not think it is any fault of the bull—a two and a half-year-old. At the last period, suspecting something wrong, one of us inserted his hand, and found the tube at end of passage seemingly obstructed by what appeared to be a fold-like growth. The cow otherwise seems in good health, has appetite and gives good flow of milk. H. G.
Sedalia, Colo.

ANSWER.

Get a practical person, who knows all about such organs; none other should, under any circumstances, attempt such dangerous practices. I expect the passage, as you term it, is all right. You have a chronic subject of nymphomania, sure. See ads for remedies.

FEED AND HEALTH.

I have a Jersey cow that dropped calf on February 23rd, and on the 8th day she refused to eat; gave her dose of physic. She appears to be stiff, held her head as high as she could carry it; gave her two more doses of physic. She appeared to get better, took her feed, but to-day she refuses to eat. We feed cotton seed hulls, a few cotton seed, a little cotton meal, ground oats with pea-vine hay. Run out in day time, in good weather.
Her milk has a bad smell, like as though she was feverish. J. S. M.
Easonville, Ala.

ANSWER.

From your description, you have one general cause for the conditions you name. I don't like your food. There is not a warm blooded mammal upon earth that can remain in health so fed—cotton seed hulls, cotton seed and cotton seed meal. I believe if you change the food, you will change the conditions permanently. Whilst so fed, I can't prescribe any likely remedy. Physicking, as you have proved, is good, so I can't see as you can do better than resort to it again.

WEAKNESS IN WETHERS.

I have a 3-year-old heifer that never had a calf but is due the first of April. When she lies down, her wethers come down.
Antwerp, N. Y. W. B.

ANSWER.

Get at once a person who understands such conditions. Inversion of the womb is difficult to manage. According to my experience, such cows are not fit to breed. I have had all sorts of conditions of inversion, partial and full, occasional and persistent, all of which were hardly worth the trouble and expense attending a doubtfull ending.

EPILEPSY

I recently purchased three shoats—a cross between a Berkshire and Chester White—and almost every feeding time one of them, just before putting feed in trough, rolls over on side and has, what seems to me, a fit. It lasts about one minute; then it gets up and rushes to the trough and eats greedily. I feed them corn meal and shorts made into a mash twice a day. I do not over feed. Has the shoat worms?
N. Bridgewater, N. Y. JAS. H. McD.

ANSWER.

You seem to have a clear case of epilepsy. There is but little to do in these cases. Rub in over the loins common turpentine, two teaspoonfuls each morning for a few days. Keep clean, plenty of sunlight and pure air. Give salt and charcoal, hard coal and screenings in plenty. Worms do, quite often, cause fits.

FAILURE TO BREED.

How shall I get a Jersey heifer to breed? She is 32 months old, has been six months in milk, is apparently healthy, good size and a good feeder. Comes in heat quite regularly, say about 19 days after service. Was served by an aged Jersey bull that was very fat on Dec. 13th and again January 27th, but failed and I blamed it on the bull. In February was again served by a young bull, and again by same March 15th. Am very anxious to get her with calf as she is a valuable heifer.
Dr. Horne would probably direct me to your advertising columns. I can easily send for a remedy for nymphomania or use some of the remedies he prescribes to deaden sexual desire but if I do how shall I get her to breed if she does not come in heat?
VISION.

ANSWER.

I have answered similar queries many times in the last two years, recommending various remedies. Lately I have made up my mind, the best thing is to get a proper special remedy, for which see ads in DAIRYMAN.

FAILURE TO BREED.

A thirteen months old Jersey heifer was served March 20, 1898 by a Jersey bull that rarely fails getting cows in calf with one service and has been served at the following intervals since: 39, 40, 22, 20, 62, 52, 29, 38, 19 and 20 days. The last time was March 14th.
A four year old cow, calved Sept. 16th, 1898,—second calf. Has never been in heat since. At intervals of three to four weeks, about one-half part of the while, glutinous matter comes from her vulva, is apparently in good health, feeds well and keeps up a good flow of milk. S.
Warrenville, Ill.

ANSWER.

Remedy same as above. I know of nothing as good under any circumstances. She is a chronic nymphomanic.
You need an emmenagogue. This is the antipode of the above. Wash out the vagina with one part Tilden's Bromo Chloralum into eight of warm water. About four ounces each morning for three times. Then wait and if needed repeat, etc. See ads for medicine to bring the heifer to heat. These are almost certain to succeed.

FOUNDER.

We have a horse that seems to be foundered all over, principally in chest and one leg. Seems to almost lose control of it at times, and his feet trouble him. Have always had to be particular about shoeing him. He has a poor appetite and looks poor although we tempt him with bran, oats, etc. He is 14 years, Antire breed, and always a restless nervous horse and always wanted to travel faster than you wanted him to go.
Rocky Run, Wis. E. C. F.

ANSWER.

Pamper him all you can. Rub in oil of cedar 4 oz., sulphuric ether one oz., 4 ffs. ammonia 4 oz., fish oil 14 oz. To be well shaken at each dressing, kept tightly corked and out of the sun and heat. Shake hard each time immediately before using.

OPENING TEAT.—FISTULA.

I have a cow that had a stoppage in one teat. A neighbor used a teat opener on it; as he withdrew the instrument she kicked, slitting the end of the teat so that it sprays, and throws a large stream and is inclined to leak. Can anything be done for it now, as it is entirely healed up?
I have a large mare 8 years old last fall. She had a bunch come on the top of shoulder, which we thought would be a fistula, but it never broke. Her neck became stiff so that she could not eat below a level of her breast, not turn her head either side. At present she can eat at a level with her knees; can turn head either side a little; the muscles of the neck are hard. The top of the neck breaks out with what appears to be boils, discharge a little, then dry down. She is in apparently good physical conition, eats and drinks well, carries good flesh.
Preble, N. Y. A. L. P.

ANSWER.

If the teat is healed up, it will have to be opened, and a stitch or two put in. Dress with compound tincture of myrrh and aloes, liberally. You will need a plug to keep the end of the teat open. See ads. in DAIRYMAN.
You can't have a fistula if the swelling has never broke open. She may be forming a fistula. You can't doctor such a case by correspondence. The case is too serious for such; you need a practical veterinary surgeon, and he will have his hands full. Gombault's caustic balsam will be a good application, long continued, outside, and 70 to 80 grains of iodide of potassa, from three to six weeks inside. Get the veterinarian; this is your best plan.

HOLE IN SIDE OF TEAT.

How can I heal the teat of a cow that has been cut so that the milk comes out at the side? She will be dry in about three weeks. O. W. L.
Los Angeles, Cal.

ANSWER.

Do exactly as advised above for similar injury.

Horse Owners! Use GOMBAULT'S Caustic Balsam

A Safe Speedy and Positive Cure

The Safest, Best BLISTER ever used. Takes the place of all liniments for mild or severe action. Removes Bunches or Blemishes from Horses and Cattle. SUPERSEDES ALL CAUTERY OR FIRING. *Impossible to produce scar or blemish.*

Hypodermatically administered, is a **POSITIVE CURE** for abortion in cows. SWORN testimonials furnished on application. **Dr. D. ROBERTS,** Veterinary Surgeon, Address, Waukesha, Wis.

RUPTURE CURED.

SUFFERED THIRTY-THREE YEARS AND NIGH TO DEATH.

Remarkable Experiences of a Citizen of Riceville, Iowa.

WM. T. BLANDIN.

One of the best known men in Mitchell County, is rejoicing in the fact that after suffering thirty-three years with a dangerous rupture, was finally cured by the system invented by Dr. W. S. Rice, Adams, N. Y. Mr. Blandin is never so happy as when relating the story of his cure. For the greater part of his life he was laid up in bed; his rupture being so large that he could not find a truss to hold it until he learned of the Dr. Rice method. Mr. Blandin tells of a near neighbor of his who was also ruptured, and for whom Mr. Blandin sent for the Rice treatment. The day it arrived his neighbor was suddenly stricken with a strangulated hernia; two doctors and a half dozen men held him down, the pain being so intense that he was out of his mind. Mr. Blandin arrived on the scene just in the nick of time and a few minutes after the patient had revived from a powerful dose of chloroform, the Rice system was put on, they had him up and dressed and he walked out to his barn. The circumstances of these two cures attracted wide attention throughout the state. Dr Rice has recently prepared a book, giving a full description of his method. It is a home cure at a very small cost and best of all it cures without pain, danger, detention from work or inconvenience of any kind. Readers should send for this book and mail it to anyone they know to be ruptured. Such an act of kindness will be worth a great deal to those who suffer from rupture. Write to Dr. W. S. RICE, 553 Main St., Adams, N. Y.

H. W. KELLOGG COMPANY, Ripon, Wis

From a Vermont Dairyman.

Some Cow Figures.—Testing Cows.—Utilizing Manure.

ED. HOARD'S DAIRYMAN:—Will you allow me to speak of the practice of dairymen in Vermont? The larger part of them keep cows that will make 125 pounds of butter per year. We will reckon for ten years at 20 cents per pound, which gives us $250. The calves are valued at $10 each, and this added to the proceeds from the butter gives $350. Another dairyman keeps cows that makes 275 pounds or more a year at 20 cents, giving $550.

This cow's calves are selling for $15 per head in my neighborhood, which makes $150 for ten years, and added to the amount the butter sold for gives $700. Take $350 from $700 and there remains $350, made on one good cow. On ten good cows, $3,500, on thirty, $11,200.

How many mortgages would be standing on farmers' homes, had they bred the best dairy stock for twenty years, and used common sense in other matters?

It is not necessary to have a Babcok tester to know what your cows are doing. Get a tin pail twenty inches high and seven inches in diameter, with dash and cover. Milk a cow three days, and churn the cream in the improvised tester, and you have the quantity and quality of butter produced. It seems to be more natural to make good butter or cheese from good cows, and it is impossible to make good butter and cheese from poor, pale milk.

Another immense waste is in the application of the manure. The cheaper they get rid of it the better. Some farmers put five times as much on an acre near the barn as is necessary, and let the more remote pieces go without enriching. It would be on the same principle as feeding all the grain to one horse, that should be divided among four or five. Four of them would flourish just like the grass and grain without nourishment.

I have used a manure spreader for sixteen years, and it has spread about four hundred loads a year. Often one man has (between chores) put out 25 loads a day, which has fed more plants than three men could have done with the ordinary wagon The farmers that take no pains to do business in a skillful manner are the ones that talk hard times. They raise but little and have but little to sell. Their bank account foots up against them every time. E. B. DOUGLAS.

Addison, Co., Vt.

$30 Per Cow.

Dairy Statistics From Maine.—Average Return Per Cow.

The returns from twenty creameries show that they have received the milk or cream from 22,680 cows, and that they have paid the farmers $682,000 for milk or cream, making an average of about $30 per cow. In some instances the returns have been as high as $50 per cow, and in others as low as $20 These same creameries last year paid to their patrons $10,000 less than they paid this year. This indicates that we have not lost ground, but advanced. A few of the smaller creameries have dropped out, but we have three or four new creameries this year that promise well. From all the data accumulated I conclude that we have, engaged in associated dairying in the state, about $900,000, as the amount paid for the product of the cows. The total number of cows in the state is 135,000, and thus we see that there are more than 100,000 cows, whose milk is being disposed of in some other way. We do not know just what that large number of cows are doing, but probably we may say that the income from the cows of Maine is but little less than $4,000,000. A large amount of private dairying is being done, much of which is of very good quality; also about our cities and villages many men are engaged in the wholesale and retail milk business, and of these 100,000 cows engaged in private work, a large number are furnishing milk for sale as whole milk, and you know that the returns from selling whole milk are much larger than those from the sale of milk or cream for butter making purposes.

Still another class of cows that we have never taken into account is the family cow. As we look over our state, we hardly find a family, except the very poor, that is not keeping a cow, and that cow largely feeds the family, provided it is a poor family without other means of support. What the product of these family cows has been it is impossible to tell or even conjecture.—*N. E. Farmer.*

Removing the Placenta.

ED. HOARD'S DAIRYMAN:—In issue of DAIRYMAN, March 3rd, D. J. DeL. asks for instruction for removing placenta. I will give a remedy which has never failed for me and I have used it on cows that have aborted in my neighborhood, with as good success as with cows that go the full time.

Pour boiling water on four quarts oats and feed while hot as cow will eat them. Two doses is generally sufficient, 12 hours apart.

My remedy for caked udder is five drops poke root extract every three hours in either feed or water. C. I. HUNT.

N. Y.

The War on Oleomargarine.

The Minneapolis *Tribune* says: "The campaign is being directed by the National Dairy Union, which led the fight in Congress which resulted in the passage of the filled cheese law. It is said that its officers have been working quietly for several months enlisting the co-operation of the various butter interests in this one supreme effort to land a knock-out blow upon "oleo." They are confident that the high tax will prevail, inasmuch as 283 of the 356 congressmen and 60 of the 90 senators represent states which have declared against oleomargarine colored so as to resemble butter. The 30 states which prohibit the sale of the yellow butterine contain between three-fourths and five-sixths of the nation's population.

The color laws adopted by the various states do not, it is claimed, furnish full protection to the farming and dairy interests, as the yellow bogus product is shipped from the unprotected states, and sold direct to consumers in the original packages under the protection of the interstate commerce decisions, and then it is claimed that the law requiring the oleo and butterine to be properly stamped is practically evaded by printing the label in small letters and making it so dim as to escape notice in the majority of cases.

If the national legislation asked for can be obtained, it will enable the makers of genuine butter to read their title clear to the American markets, as against any imitation article of the least merit. No imitation butter can stand a tax of ten cents a pound. If the dairy interests secure this legislation they should be compelled to give the public a good article for the genuine."

Lice on Animals.

These wingless insects are found parasitic on all animals. Cattle are unfortunate in being the most common victims of lousiness Sheep are rarely affected. We meet with this disease most frequently during the winter months, in neglected, half-starved, dirty animals. Young animals are especially liable to be infected. Sometimes, however, even well-kept cattle suffer severely.

So-called lice are either true lice (Hæmatopinus) or bird lice (Trichodectes). The former have a slender, often spindle-shaped body, a pointed head, grayish blue color, and suck blood. The Trichodectes are broader, have a squareish head, brown color, and have biting mouth parts, living on hair and epidermal scales. Trichodectes are usually found on neglected, unthrifty animals with long shaggy hair and a dirty scaly skin. They usually disappear as soon as the animal's condition improves. True lice, on the other hand, occur also on thrifty animals.

Every species of domestic animal has its own specific louse, or lice (horse louse, ox lice two kinds, pig louse, goat louse, dog louse, etc., and Trichodectes of the horse, ox, sheep and dog). The louse of one species of animal can not exist permanently on another species. * * *

The remedy which has given the most satisfactory result to the writer is kerosene emulsion, made as follows: Kerosene, two gallons; common or whale oil soap, one quarter pound; water, one gallon. Heat the solution of soap and add it boiling hot* to the kerosene; then churn the mixture for ten minutes. Dilute the emulsion with twenty gallons of water and apply with a spray pump. If no spray pump is at hand, drive the animals, if many are to be treated, into a narrow chute and apply the emulsion with a common watering can, being careful to treat all parts of the body.

Select a mild, sunshiny day for the operation. In the course of four days or a week repeat the application in order to destroy those lice that have, in the meantime, emerged from the nits. Where the animals have been kept in stables or pens, do not neglect to give these places the same treatment; they are just as lousy as the animals, and if not treated they will soon reinfect the animals. Finally, avoid conditions favorable to future infection, by giving animals proper care and keeping them in a vigorous, thrifty condition. For long-haired animals (calves), shearing might be recommended. Weak, run-down animals may require special nursing to recover completely from an attack of lousiness.—*Press Bulletin*, Kansas Experiment Station.

*NOTE—Be sure to have the water boiling hot when you add it to the kerosene, and churn it thoroughly, otherwise you will have trouble in making a good emulsion; which, when made right, should have a creamy appearance.

Young Lily 11323, Joseph Banard to S. Alfred Spofford, Hopkinton, N. H.

Peterboro, N. H. WM. H. CALDWELL, Sec.

Among all the mocking horrors of chronic indigestion and liver complaint, none is more unbearable than that dreadful sensation of giddiness in which the whole world, indoors or out, seems to swim around before the sight in the most sickening and nauseating manner until one's entire being becomes faint and wretched with indescribable misery.

"I was suffering with what the doctors called chronic indigestion, torpid liver, and vertigo," writes Mrs. Martha E. Barham, of Newville, Prince George Co., Va. "The doctor did me no good. My symptoms were giddiness in the head, pains in the chest and an uneasy feeling all over. I also suffered with female weakness.

"I was all run-down and could not do any work at all without suffering from nervous attacks. I wrote to Dr. R. V. Pierce, of Buffalo, N. Y., for advice. He advised to use Dr. Pierce's Golden Medical Discovery and 'Favorite Prescription.' I did so, and used five bottles of each, and I cannot express the benefit I have received from these medicines. I gained in health and strength. When I commenced to use the medicines I weighed only 112 pounds, now I weigh 140 pounds. I thank God and Dr. Pierce for my recovery. My husband and friends all thought I would die but to-day I am a well woman."

The wonderful effects of this great "Discovery" are genuine and permanent; they are not due to any false or alcoholic stimulus for it contains no alcohol. Real substantial healthy musuclar strength is built up; the stomach and liver are toned; the blood is purified and vitalized; the nerves are steadied; the entire constitution is rejuvenated and renewed.

In case of constipation, there is nothing quite so effective as Dr. Pierce's Pleasant Pellets. They act comfortably though surely; they do not gripe; you do not become a slave to their use. Their effect is lasting. There are countless substitutes; but nothing else is like them.

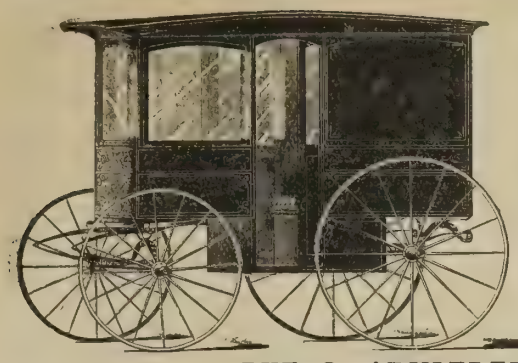
Six Tools in One.

Remove one bolt from the "PLANET JR." No. 4 Combined Drill, and in a minute you can have a perfect Wheel-hoe, a Cultivator, a Rake, or a Plow, as you please. The drill drops in hills at any distance apart, or sows perfectly in drills, as desired. SIX TOOLS IN ONE—and each the best tool of its kind made.

This quick adaptation to the work is the great feature of all the "PLANET JR." tools—hand-drills, wheel-hoes, horse-hoes, and two-horse tools. The swiftness and cheapness of their work are the secret of farming success.

The new "PLANET JR." Catalogue for 1899 not only describes all these wonderful tools, but includes also SIXTEEN FULL PAGES of fine photographic views—interesting field scenes in France, New Zealand, etc., showing the different crops and methods of cultivation with the "PLANET JR." tools at work. Write us for a copy; it's sent free.



$500 in Gold for the best gardens in 1899. Write for particulars.

A Perfect Milk Wagon

On a Perfect . . . Short Turning Gear

We make the only drop center wagon that has a self-balancing, short turning gear. All parts are wrought iron forgings. It is so plain and simple that it can't get out of order and if any part should break, any country blacksmith can easily repair it. All other wagons of this kind have complicated gears, and mostly made of cast iron.

Write us for our Catalogue which fully illustrates and describes this wagon and 10 other styles.

THE O. ARMLEDER CO., Cincinnati, Ohio.

No. 816—Two-Spring Carriage, with side curtains, storm apron, sunshade, lamps, fenders, pole or shafts. Price $58; same as usually sells for $85 to $90.

FULL VALUE For the Money.

You are entitled to that. It does not mean simply that you should get the best goods for the money, but also that you should be saved the added expense of agent's commissions, dealer's profits, salesmen's expenses, etc. We save you all this by selling you direct from our factory at wholesale prices.

We are the largest manufacturers in the world selling vehicles and harness to the consumer exclusively.

We make 170 styles of vehicles and 65 styles of harness. We ship anywhere for examination and guarantee everything. Send your name on a postal card for ***Free Illustrated Catalogue.***

No. 100—Double Buggy Harness. Price, full nickel trimmed, $17; as good as retails for $25.

ELKHART CARRIAGE & HARNESS MFG. CO. *W. B. Pratt, Sec.* ***ELKHART, INDIANA.***

DID YOU

Ever walk behind a plow all day and toward evening experience that soreness of arm and shoulder because you had a plow that persisted in winging over? If you want to know what will cure the plow, drop us a postal card. The heel plate will do it; it weighs but 8 ounces, but it's a wonder worker.

MORRISON MFG. CO., Ft. Madison, Iowa.

THE NEW BOOK Feeds and Feeding

By Prof. W. A. HENRY. Wisconsin Experiment Station.

This book should be in the hands of every stock feeder in the country. Every reader of HOARD'S DAIRYMAN ought to have it. It is a large, well bound book, nicely printed, over six hundred and fifty pages. Price $2.00.

Four Yearly Subscribers at $1.00 Each ($4) Will Secure It as a Premum.	or	Four Yearly Subscribers at $1.00 Each ($4) Will Secure It as a Premium.

Of This Book Hon. JAMES WILSON, Secretary of Agriculture, Washington, writes as follows:

"Prof. W. A. Henry, Dean of the Agricultural Department of the University of Wisconsin, has recently given to the American student and the American farmer a work on feeds and feeding. Singularly enough, up to this time we have had nothing along this line sufficiently comprehensive from both the scientific and Practical standpoints. We have had very able works from both, but Prof. Henry is the first to combine science with pratice, and give us a work that will be of value alike to the instructor in the Agricultural College, to the student who is seeking the principles underlying feeding, and to the practical farmer who feeds.

This publication will take its place immediately in the college library, and ultimately in the private library of every farmer in the land. When the instructor, student or practical farmer inquires where there is a work thoroughly exhaustive of this subject, he can now be refered to Prof. Henry's book.

Send as above, or will be forwarded, carriage paid, on receipt of price $2.0

EXCURSION RATES to Western Canada

and particulars how to secure 160 acres of the best wheat growing land on the Continent can be secured on application to the Superintendent of Immigration, Ottawa, Canada., or of the undersigned.

WILLARD H. KNAPP & CO., BOX R, **Cortland, N. Y.**

The Sharples Tubular.

The bowl alone revolves.
It spins on air.
It is a hollow bowl.
Its cream is superb.
Its skimmilk without fat.

It is made in three sizes—2,500 lbs. per hour, 4,000 lbs. per hour and 6,000 lbs. per hour.

Mr. Sears owned disc machines. First, he bought one *Tubular*. Second, he bought two *Tubulars*. Third, he bought three *Tubulars*. Fourth, he will buy a lot more.

BEDFORD, QUEBEC, August 12, 1898.

P. M. SHARPLES, West Chester, Pa.

Dear Sir:—The No. 25 Tubular Separator which I purchased from you is doing fine work. I have tested the skim milk repeatedly and never found it to contain over .05 of one per cent of fat, and often less. I find that it does not take anywhere near as much oil to run the Tubular as it does competing machines, and that the cream comes away smooth and fine. I am well pleased with the work the Tubular is doing.

Yours truly,
EUGENE SEARS.

More leading features in catalogue and circulars. Send for Catalogue No. 46.

IDEAL

Rotary Milk Pump

Which was thought to be already perfect by large numbers of our customers. We have simplified the construction without changing the general lines. It now has only one thumb screw to loosen to take off cylinder head. It has LARGE CAPACITY. Is VERY DURABLE. NO TROUBLE TO CLEAN. Made in THREE SIZES.

...A... SANITARY **Milk and Cream Ticket.**

A coupon milk and cream ticket is the only milk or cream ticket that complies with all sanitary requirements, and is also the only milk ticket by which a complete check can be kept on both customer and driver. We would like to send you a sample.

We have a large up-to-date and complete line of Milk Dealers' Supplies. Everything you need. Our Ideal Milk Jars and Caps are the best on the market. Write for sample.

Our latest Milk Dealers' Price Current contains new ideas and new apparatus. May we send you one?

Alpha De Laval Separators, Ideal Skim Milk Weighers, Elgin Style Ash Tubs, Spruce Australian Butter Boxes, Ideal Turbine Testers, Stearns' Style Spruce Tubs, Ideal Corrosive Sublimate Tablets, Refrigerating Machinery, Ideal Cleansing Powder, Etc., Etc.

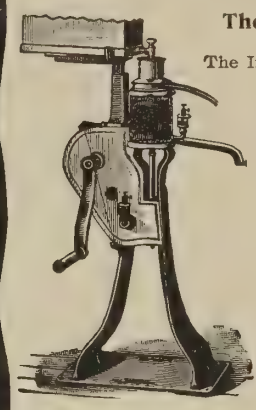
FACTS, NOT FICTION,



ABOUT

The Improved U. S. Triple Current Separators

They are the cleanest Skimmers on the market, as witness the reports from the State Experiment Stations and users the country over. They are also noted for their simplicity, ease of operation and durability.

A Few 1899 Experiment Station Reports.

Massachusetts,	average of 19 tests,	January 7th to 31st,	.033 of 1%
Ohio,	" 19 "	" 10th to 21st,	.034 of 1%
Vermont,	" 18 "	" 9th to Feb. 3d,	.038 of 1%
Wisconsin,	" 17 "	" 2d to 19th,	.03 of 1%
An average from 73 tests of skim milk of			.034 of 1%

The U. S. Excels in Every Particular

FORESTVILLE, CONN., Feb. 18th, 1899.

The Improved U. S. Separator is giving excellent satisfaction. In comparing it with other makes, have found it to far excel in every particular—in thoroughness of skimming, ease of operation, design and finish, simplicity of construction, therefore easy to clean, and durability. Any one contemplating buying a Separator should investigate the merits of the Improved U. S.

WILLIAM F. KENNEY,
Buttermaker for J. Hart Welch.

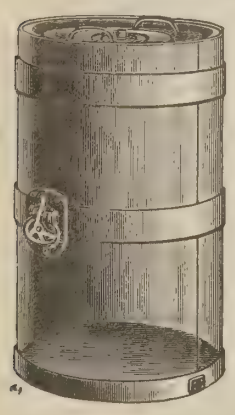
The U. S. the Best on the Market

DEER PARK, MO., Feb. 25th, 1899.

The butter I exhibited at the St. Louis Fair scored 98½ points and won the Sweepstakes over the creamery butter from several of the best Creameries in the United States. It was made from cream separated by the No. 5 Improved U. S. Separator I have been using for nearly three years, which has always been in running order and given entire satisfaction. If I had to buy another it would be an Improved U. S., for I think it the best on the market.

NATHAN KING.

No Loss of Cream in the Skim Milk



BROMPTON FALLS, P. Q., Jan. 31st, 1899.

The No. 1 and No. 0 Improved U. S. Separators purchased last spring are giving perfect satisfaction. They run smoothly and easily and take all the cream out of the milk. They are simple, durable, and not liable to get out of order.

A Great Mystery Solved.

The reason why so much poor milk is delivered to the creamery or cheese factory is that it is allowed to be drawn in railroad, or narrow necked cans, which are absolutely impossible to keep clean.

USE NONE BUT

OPEN TOP UNION and EMPIRE STATE Factory Cans,

Which can be kept ABSOLUTELY CLEAN and PERFECTLY VENTILATED. Made of heavy tinned steel, any style top or center hoop.

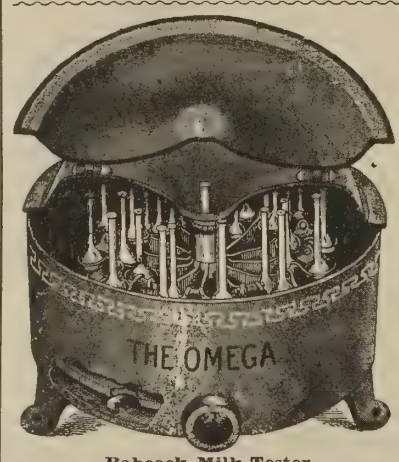
LIKE A SNOW FLAKE

Did you ever watch a snowflake dissolve in your hand? Then you know exactly the process by which "the salt that's all salt" permeates the butter so thoroughly, so easily. This soft, flaky nature of

DIAMOND CRYSTAL SALT

is one of its best recommendations—but not the most important. Its purity is its strongest point. You can rely on it absolutely, and all the time. It's the salt butter makers use who want to be sure of success. Book sent free.

DIAMOND CRYSTAL SALT CO., St. Clair, Michigan.



THE DAIRY "VICTOR" Churn.

This Combined Churn and Butter Worker is proving itself to be precisely what the farmers and dairymen have been seeking after. It's work is as complete as the work of the "Factory" Victor Churn, which is rapidly supplanting every other Combined Churn and Butter Worker.

IT IS THE ONLY SUCCESSFUL DAIRY COMBINED CHURN AND BUTTER WORKER ON THE MARKET.

It is easy to handle, easy to clean, perfect in its work, durable and reliable. It charm every farmer and dairyman who sees it work. Manufactured by . . .

Subscriptions in United States and Canada $1.00 per year; 6 months 50 cents; 3 months 25 cents.

Foreign Subscriptions may be sent through Sampson Low, Marston & Co., St Dunstan's House, Fetter Lane, London, Eng., or their agents, including the leading news dealers and book sellers in nearly all foreign countries.

All countries in the Postal Union $2 04 a year; not in the Postal Union $2.56.

Correspondents must not expect us to acknowledge the receipt of letters containing remittances for subscriptions. The receipt of the Dairyman is sufficient notification that the money has been received. The label on the paper will show date to which subscription is paid. In case of renewals if date on label is not changed within two weeks after remittance is sent, inform us at once.

Remit by draft on Chicago or New York, or Post Office or Express Order; never by personal check.

ADVERTISING RATES.

Twenty-five cents per line, (agate measure) 14 lines per inch, each insertion.

Reading notices, 50 cents per line (nonpariel measure) each insertion.

JUST WHAT HE WANTED.

A great many of our subscribers appreciate the splendid line of advertisements carried by this paper. Here is one which is a sample of many letters we received:

Ed. Hoard's Dairyman:—I received a sample copy of your paper. I think it the finest dairy paper I ever came across. I found an advertisement in it that I wanted, and when I was writing to them I stated that I found their ad. in Hoard's Dairyman. Enclosed find $1.00 for Hoard's Dairyman

Renfrew, Ont. Jas. Breen.

We consider the advertising pages of the Dairyman of great advantage to all enterprising dairymen.

An Irish gentleman had a fine cow which was, however, so bad a kicker as to be utterly worthless. He told his hired man to take her to the fair and sell her but not until he had told the buyer all about her.

The man returned, but with so large a price as to surprise the owner, and the following colloquy ensued:

"Are you sure, Pat, you told the buyer everything concerning the cow?'

"Bedad, I am, sir," said the herdsman. "He axed me if she was a good milker. 'Begorra, sir,' says I, 'it's you that will be tired milking her.'".

Separator Experience Wanted.

Ed. Hoard's Dairyman:—I intend putting in separator and want to know of my brother dairymen what kind they like best from actual experience.

I want a machine that can run with tread power and by hand also. Let me hear from the readers of Hoard's Dairyman.

Does skim milk from separator make as good butter milk as that made by churning whole milk? We sell all our butter milk and want good quality. W. A. Johnson.

Mississippi Co,, Ark.

We cannot undertake to open our columns to a general report by users as to their opinions in regard to rival separators. Write to the advertisers and they will furnish opinions and testimonials by the score.

There is a difference of opinion in the successful manufacture of butter milk from skim milk. One correspondent reports complete success, while others state that the flavor is not so good—the difference, probably, being in the methods, time and temperature used in ripening the skim milk.

Plank Frame Barns.

We copy from the *Ohio Farmer*, plans and specifications as follows:

By J. H. Fisher, Jefferson Co., Ohio.

Herewith I send you drawings of a barn which may be called a "sky scraper," and one I know will stand, and there is nothing whatever to interfere in any way, from the barn floor to within a few feet of the comb; that is, if you use a 20-foot studding you will have about 38 feet of space in which to store your crops. In these drawings, or in

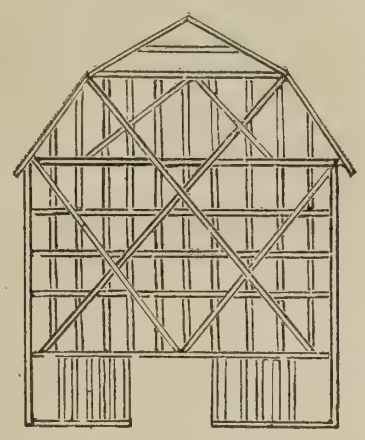

Fig. 1.

building a barn of this kind, I would advise using heavier lumber for the under story, say 2x8s. The rafters need not be any heavier than 2x6, for as both sets, upper and lower, are of the same length, and the lower set being placed at an angle of 45°, and well spiked to both plates, the weight on their middle is not nearly so great as when placed at a lesser angle. And the upper set placed at an 8 or 9 inch pitch, with a truss, as shown at A Fig. 2, and these tied together by a 1x6 or 1x8 is sufficiently strong to resist the pressure from above. The long brace running from the end of the short collar beam to the heel of the rafter, and there being notched over the plate, and spiked to both the rafter and purline plate, will prevent the barn from spreading, from the outward thrust of the roof, for the weight is

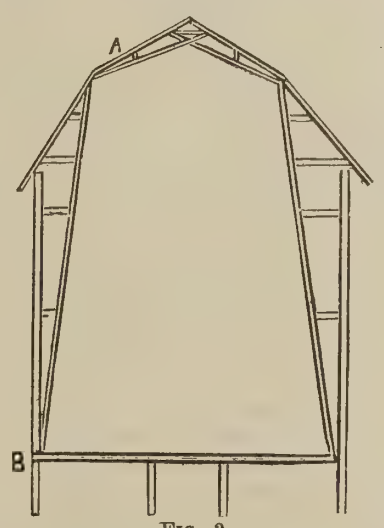

Fig. 2.

pulling from the opposite side of the roof, if there is any pulling at all. I firmly believe by this means of bracing, it is almost an impossibility for the barn roof to give down or the barn to pull apart. The rafters just over the purlines of the lower set, are tied so as to prevent it from a giving way; thus the roof itself is a support to the sides of the building. As the purline posts are set in such a position, the weight of the entire upper portion of the roof rests upon the ground sills. They are so constructed to rest upon a block of 2x8, set between two of the lower set of studding, and passing up between the cross sills, and having a shoulder resting upon the same above at B, Fig. 2.

Any carpenter can build a barn from these drawings, and after it is completed the owner cannot help but be pleased, for he has an abundance of room to store all his crop in one place. The truss of the upper tier of rafters need not be under each of them. If the space between the spans be equally divided into three spaces, it would be sufficient; and then on each set of rafters, not having a truss, I would place a collar beam, so the lower edge would come on a level with the cross of the truss braces, and then nail a 1x8 perpendicularly from the comb to the collar beam. This gives a good chance to fasten the hangers for a track or any kind of hay sling.

Now, I think any one building a barn of this kind will not make a mistake if it is room he wants above. And so far as the objections to girders and weak points, all these have been removed, and the barn will stand almost a West India hurricane. Of course the height can be reduced by using a shorter studding and still have more room under the same roof than in an ordinary barn.

A barn of this kind will cost more money, but when you have it completed you have plenty of rooom. The difference in the roof is about seven squares. But to anyone who can see his way clear I would advise to pay the difference.

To anyone who may wish to find out the strength of the material in this frame, I will give a rule to make the test. Multiply the square of the perpendicular of any stick in inches by the horizontal in inches, and this by 600, and divide the product by the length in feet, and from this subtract the weight of the timber and you will have the number of pounds any stick of timber will safely bear up when supported at each end and the weight applied directly in the center. Example: How much will a 2x8 joist, 16 feet long hold up when supported at each end and the weight applied to the center? 8x8x2 equals 128x600, equals 76,800; divide by 16, equals 4,800 pounds—88 pounds for its own weight, equals 4,712 pounds. So we find that one joist will hold up over 2¼ tons This rule applies to good oak timber, free from knots and imperfections.

By John L. Shawver, Ohio.

Assuming it is for general purposes, we give a plan (Fig. 3) that will be very convenient, affording a large grain bay, 16x38x 20 feet; a threshing floor 14x38, with decks above for feed bins or storage of light materials of any kind; stable room for four horses and seven cows, with a good wide feeding alley between, and the entrance doors protected by a wide canopy.

It is difficult to give itemized cost of such a barn, because prices of materials and labor vary so much in different localities, but we will give an itemized bill of materials.

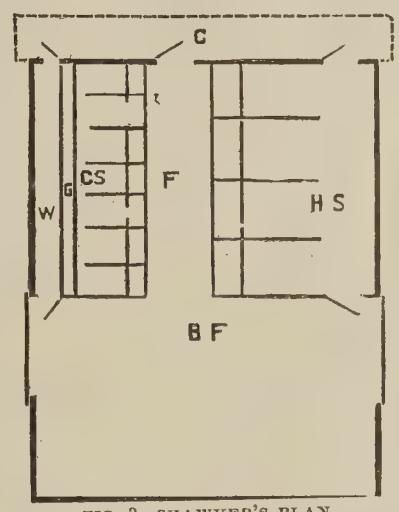

Fig. 3—Shawver's Plan.

C, canopy 6x38; W, walk; G, gutter; C S, cow stalls: F, feed alley, 8x24; H S, horse stalls; B F, barn floor; G, grain bay. Barn is 38x54 ft., 20 foot posts; gable roof ⅓ pitch.

Counting on good foundation walls all around, and pillars in interior for plank floors, we have need of three mud sills 8x10x30, and two mud sills 8x10x24. If cement floors are used the above are not necessary. For the two end bents,—4 sills, 2x8x38 (18 and 20 lengths); 4 beams, 2x8x38 (18 and 20 lengths); 20 posts 2x10x20, 4 purlins, 2x10 x30 (18x12 lengths); 16 nailers, 2x6x19; 4 braces, 2x4x22; 8 braces, 2x6x12; 10 fillers, 2x6x20; 6 stiffeners, 3x6x20; 2 ties, 2x8x20; 4 saddles, 2x10x3; 3 joist bearers 2x10x38 (19x19 lengths).

For the three interior bents,—6 sills, 2x8 x38 (19 and 20 lengths); 3 sills, 2x8x14; 6 joist bearers, 2x10x38 (19 and 19, or 14 and 12); 8 joist bearers, 2x8x10; 12 posts, 2x10x20; 4 posts, 2x10x30 (16 and 14); 8 posts, 2x10x22; 4 fillers, 2x10x12; 16 fillers, 2x10x8; 6 roof supports, 2x10x25; 6 sub supports, 2x6x18; 6 collar beams, 2x12x5; 6 ties, 2x10x9; 6 ties 2x6x7; 6 ties, 2x6x6; 2 ties, 2x6x5; 6 braces, 2x6x9; 12 stays, 2x4x4.

For side timbers,—2 sills, 2x8x16; 2 sills, 2x8x14; 4 sills, 2x8x12; 8 nailers, 2x6x16; 4 nailers, 2x8x14; 2 nailers, 2x6x14; 16 nailers, 2x6x12; 2 nailers, 2x8x12; 2 nailers, 2x8x18; 4 plates, 2x8x16; 4 plates, 2x8x14; 8 plates, 2x8x12; 8 cap plates, 2x10x14; 4 purlin plates, 2x10x16; 4 purlin plates 2x 10x16; 8 purlin plates, 2x10x12; 64 couplings, 2x10x6; 4 couplings, 2x10x4; 4 braces, 2x6x12; 12 braces, 2x4x6; 6 intermediates, 3x8x20; 12 braces, 2x6x22; 4 braces 2x6x12; 2 stays, 2x8x8

For the floor—32 joist, 2½x8x19; 12 joists, 2½x8x14; 1,140 sq. ft. of floor laid double; 336 sq. ft. of floor laid single.

Mows—6 joist, 2½x8x16; 40 joists, 2½x8 x12; 912 ft. of mow boards.

Decks—12 joists, 2x8x14 ft; 288 sq. ft. of floor.

Siding—4 300 ft. net, 20 ft. length.

Roof—56 rafters, 2x6x16 ft; 56 rafters, 2 x6x11; 3,000 sq. ft. sheathing; 30 squares roof felt; 30 squares slate, net; 220 lineal ft. cornice.

Stables.—40 studs, 2x4x8; eighteen studs, 1½x4x8; 700 sq. ft. in. boards; 300 ft. 1½ in. boards.

Canopy.—2 plates, 2x8x20; 2 plates, 2x 6x20; 20 rafters, 2x5x8; 320 ft. of sheathing. 3½ squares roof felt; 3½ squares slate.

Hardware.—2 truss rods, 1x39 with turn buckles; 36 bolts, ½x6½, with washers; 100 lbs. No. 60 spikes; 100 lbs. No. 40 spikes; 300 lbs. No. 20 spikes; 300 lbs. No. 9 nails; 300 lbs. No. 8 nails.

This frame can be made ready for raising by four carpenters in two and a half days, and should not cost over $600 or $700. One of my neighbors, Mr. B. F. Howard, built 40x60, last May. He sawed the timber upon the farm and used pine siding tongued and grooved, and painted up in nice shape at a cash outlay of less than $500.

By D. D Maxwell, Ross Co., O.

I send you a sketch of a middle bent (Fig 4), showing a self-supporting roof, and post braces, instead of purlines.

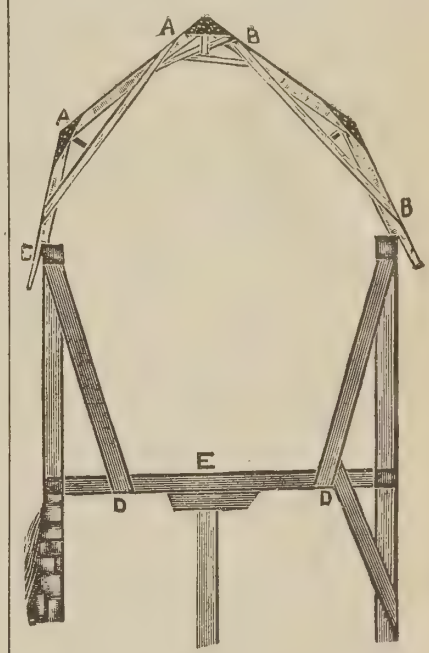

Fig. 4—Self-supporting roof.

At A, A, A, in barn rafters, you will see the joists are reinforced by inch boards nailed on each side; also at B, B, B, B, are boards nailed on each side, and at A a piece of 2x4 is cut in between the boards and under the rafters, as the rafters will be two inches thick and in width according to the size of barn; up to 20 feet, 2x4 is heavy enough. But if the barn is 40 or 50 feet wide, 2x6 should be used. I always put rafters 2 feet to centres. I prefer solid timber for posts, plates and sills. At C to D, I spike (or on large barns, bolt,) plank the same width as posts. At E, I put a post in bank barns, and stone in common barns. I do not send plan of girts, as for drop siding, they should run one way, and for barn boards, the other. For braces, nail fence boards on inside of studding or girts, from lower corner to opposite upper corner. It makes no difference whether you use studding and drop-siding or girts and barn boards, the board brace works the same, and there is no use of using both studding and girts.

It is somewhat amusing, to note to what extent partizanship will carry a man in the claims he makes for his favorite breed of cattle.

There lies before us a little pamphlet on the "Red Polled Cattle", by that noted advocate of *general-purpose* breeding, J. Mc Lain Smith, of Dayton, O. On page 26 he speaks of the peculiar richness in solids, not fat, of the milk of Red Polled cows and says: "It is in other words, preminently like the cow herself, a general-purpose product."

The milk of any breed of cattle is a general purpose product. It is composed of various food elements. It is designed by nature for one purpose alone, that of the support of offspring. The milk of the Red Polls is no more so than any other breed, and is just as much so.

Where is the argument?

M. W. EGGABROAD, of Aurora, Ill., reports the sale of $661 worth of butter, alone, from 12 cows, for the year ending Februrary. This is a butter yield of $55 per cow, aside from the skim milk values. When we consider the low price of butter the past year, it is evident that Mr. Eggabroad has mixed brains and good care with his feed to his cows.

THAT was an eye opener that E. B. Douglass, of Vermont, worked out on page 142, last issue, concerning the difference in money earned in ten years by the cow that makes 275 pounds of butter a year, or 125 pounds, which he declares is the average for a great many Vermont farmers. It amounts to $350, counting butter at 20 cents a pound.

Is it any wonder so many farmers groan with a fearful pain in the pocket, while they persist in working with such a miserable tool as a hundred and twenty-five pound cow?

AN OLEOMARGARINE THREAT.

"Pshaw! Why, we have $40,000,000 behind us in Chicago, and dead loads of political influence besides. We'll make these butter men and pure food cranks, who are trying to fight us, look sick."

That was the boast made by a prominent dealer in oleomargarine in Baltimore, in the presence of a reporter of the *Washington Star*, recently.

The above boast can be taken as a clear indication of the usual boasts by these oleomargarine conspirators against the farmers and consumers of the land. Money and "dead loads of political influence."

That "influence" reaches Tom Platt, in New York, and paralysis is at once prevalent among all of his followers. It reaches into the Attorney General's office in Washington. It has long been an inmate of the United States Revenue Department.

It is seen in Ohio, in Illinois and in every state, where they do not have a live, fearless, independent Dairymen's Association to stand up and defy this influence.

But the farmers of the land are watching this underhanded game, that is being played by the high officials they have trusted.

We suggest that a plank, charging up this iniquity, would make very interesting reading in a national political platform about 1900. Lots of evidence of this knavery can be had, and we hope will be had.

TYPE AND BREED.

We present this week some more pertinent and valuable matter from Prof. C. L. Beach, in connection with the year's test of the Storrs College herd of cows. We most earnestly urge our readers to a thorough study of the principles and facts brought out here. They are the same conclusions that HOARD'S DAIRYMAN has been vigorously contending for, for years. Prof. Beach has confirmed, under scientific methods, and with a careful keeping of accounts, what all special-purpose dairymen have believed in for many years.

But it is worth a great deal to have this Connecticut lesson emblazoned on the gate posts of our memory, so that as we go out and in with our daily work, we may see it constantly.

We must become saturated with our conviction, if it ever amounts to anything as a guide in our conduct.

Take this statement that Mr. Beach makes, for instance:

"*The type however is still the determining factor in the economical production of milk as well as in the production of butter.*"

What type does he allude to? Not an Ayrshire breed type, or a Jersey type or a Holstein or Guernsey type, but a distinctive *dairy* type. There is where the essence of all these breeds lie. That is the distinctive object of their breeding. That is to be taken as the outer measurement of their inner power, their economy as agents and forces on the dairy farm. It is what the *Breeder's Gazette* contemptuously calls "The Wisconsin idea" of a cow.

Well, she seems to demonstrate herself as the best money maker, whether in Minnesota or Connecticut or elsewhere.

Now the lesson is as important to the breeders of dairy cattle of all breeds, as it is with the ordinary dairyman when he takes it with him to measure the cow he wishes to buy. This great idea of the *dairy type*, is where the great mass of breeders and dairymen are so sadly lacking. They have notions but not *judgment*. They have breed fancies, and ideas of breed characteristics, but not clear, clean cut understanding of the physiological relation between Temperament and its resulting Form, and the relation that both Temperament and Form have to Function. When the breeders of all our dairy breeds of cattle have a clearer idea of these basic principles, then will we see them producing a larger number of dairy cows that fulfill the dairy purpose. It is this perfection of type or dairy form that all should breed for, on the theory that we will thus reinforce the specific purpose or function that we wish to see embodied in our cattle. And whether it be in the brain of the breeder or the man who is buying cows for dairy purposes, there should be but little place for any of these dual-purpose ideas, if either wish to secure a cow that shall bring the largest profit.

THE EFFECT OF THE FIRST IMPREGNATION ON FUTURE PROGENY.

Not long since, we heard a very successful breeder of Holsteins declare that he deemed the first impregnation of his heifers the most important of any, and that he would subject himself to greater expense, to secure for them a valuable and potent sire than at any other time in their subsequent history. His claim was that he had noticed that if the first calf was from a very superior sire, the cow would show the influence of that sire in all subsequent progeny.

This theory has been stoutly contended for, and as stoutly opposed, for years. Yet, nearly all the leading naturalists of the world have believed it to be true. In HOARD'S DAIRYMAN, of May 2, 1890, Mr. Thos. M. Harvey, the noted Guernsey breeder, of Pennsylvania, gave a very interesting and extended article on the above named subject.

In this article, he cited various eminent authorities, in proof of the soundness of the theory. Of these he quoted Dr. Manley Miles as saying:

"The influence of the male in the process of procreation is not limited to his immediate offspring, but extends also through the female that he has impregnated, to her offspring by another male. Paradoxical as this statement may appear, there are many well authenticated cases on record, that cannot be satisfactorily explained on any other hypothesis".

The close observing Darwin remarks:

"Many well authenticated facts have been published, and others have been communicated to me, plainly showing the influence of the first male on the progeny subsequently born by the mother to other males".

Prof. Agassiz and several eminent physicians contribute their experience in confirmation of the theory.

Mr. Harvey gives a very interesting instance relating to the first importation of Guernseys, into the United States, by Nicholas Biddle. He says:

"When I first visited Judge Biddle's herd, at Andalusia, some sixteen years ago, I saw there a fine Guernsey cow, without horns, a muley. This excited my curiosity, as I had not heard of any muleys among Channel Island cattle before. Upon inquiring, I learned the history of her about thus: The Biddle's first importation consisted of three cows only, no bull; in this extremity, they were compelled to let one of them (Jennie Dean) be served by a neighbor's scrub bull. Not anything strange that the calf came to be a muley.

But to illustrate our subject; the same cow in after years, when served by a thoroughbred Guernsey bull, having horns, produced some calves without horns, clearly showing how she had been affected by the muley scrub. See our Guernsey Herd Book, No 8. Muley was the dam of No. 10 cow June, the muley I saw. In a letter from Judge Biddle, received last week, he says my statements that I had referred to him were about correct, and they are detailed above. He also informs us that Prof. Gibson on examining this case, said he saw no muleys on the Island of Guernsey, and our neighbor, S. C. Kent, reports the same."

The obvious lesson from the above facts is, that every farmer, and particularly the dairy farmer, should pay particular attention to the *quality* of the bulls they place at the heads of their herds. A most foolish notion prevails with many that a cheap animal is as good as any other. Do they stop to think that the quality of all our dairy breeds can only be raised by breeding always from the best? We have seen lots of farmers scale down the quality of their herds in a few years by their indifference to the kind of bull they used. Then again, we have seen a wise one, here and there, scale the herd up by the opposite course.

There are any quantity of male calves that should never be permitted to breed. A certain Jersey breeder recently told us that he turned all his refuse males over to the farmers, who would not pay more than $25 to $50 for a bull. We asked him what would be the result of that policy on their fortunes. His reply was significant: "Well, I am not seeking their fortune. They had rather buy a failure for $25 than a success at $100, and I am willing to let them have their own way." When we consider the long time influence of the male on the heifer, is he a wise man who buys a poor cheap bull in preference to a good one, even though the price for the latter is greater?

COW TREATMENT.

Mr. Geo. A. Martin of New York, in the *Orange Judd Farmer* gives the following description of the way certain men under his observation used their cows.

It seems passing strange that there exists such a host of men like the first two described, and so few like the last. And all this too, when every man with a thimble full of brains, if he will use them, knows that the best profit from the cow follows the better treatmemt.

But here is what Mr. Martin says:

I have in mind two cows kept near me. The owner of one of them has repeatedly been seen to stop with his team, at evening, near the pasture gate, lead out the cow, tie her by a rope around her horns to the rear end of the wagon and start off at so brisk a pace, as to keep the heavy uddered cow on a trot all the way home. The other cow has good usage in summer, but generally comes through the winter "spring poor" and plastered from hip joints to heels with stable filth. Fully one half of the usefulness of any cow is destroyed by such treatment. On the other hand is a farm laborer whose yearly compensation includes the "keep" of a cow. He has a grade Jersey, whose place in summer is in green pastures. In cold weather she has a snug, well-bedded stall, with plenty of food and water and the daily application of curry comb and brush. She not only supplies the family with milk and butter, but in addition there is, for half the year, a surplus of butter which brings an extra price.

An Iowa Patron's Record.

ED. HOARD'S DAIRYMAN:—After reading article on page 84 from Maquoketa, record of amount of money received by a Mr. Roher, I thought I would give you the figures of one of our patrons. His five cows and one heifer all came in in September, and we paid him for October, 6,136 pounds at 75 cents, $46 02; November, 1,996 pounds at 75 cents, $14.97, and 3,771 pounds at 80 cents, $30.16; December, 5,676 pounds at 85 cents, $48 25; January, 5,263 pounds at 90 cents, $47.36; an average of $31.12 each, for four months, for milk alone. In February, they were doing as well, but owing to his health, he made an auction, sold his cows and rented farm. The cows, by the way, brought him over $40 per head. So you see all Iowa cows are not classed in the $30 list for 12 months work. We have many patrons whose cows pay them over $45 per year for milk alone. H. D. WHITE.

Charles City, Ia.

Sow Alfalfa.

[Kansas Experiment Station Press Bulletin.]

Every Kansas farmer who has fed alfalfa recognizes it as a good feed, but a great many have not as yet begun to realize its full value, and do not know what they are losing by not having it as one of their main feeds. The results from giving alfalfa to dairy cows and fattening steers, as a part of the feed, compare very favorably with those from such expensive feeds as oil meal, cotton seed meal, and bran, and in fact takes the place of those feeds in the ration. The Kansas Experiment Station is demonstrating also that alfalfa is an invaluable hog feed. A pound and a half of alfalfa a day per hog used with kafir corn produces gains very nearly equal to a feed of one-fifth soy bean meal and four-fifths kafir corn. And now is the time to begin preparing to sow alfalfa. A deep, loose seed bed is not what you want; but it needs to be moist, and for this we may have the required rainfall and we may not. However, the ground is wet now, and if you can keep that moisture there until the plant gets the good of it, there is enough, even without another rain before the first of June, to give alfalfa the best kind of a start. The ground to be put in alfalfa does not need to be plowed deep, but the surface three or four inches must be kept in the best of tilth. Disc or cultivate as soon as possible, and then harrow every week or so; or at least after every rain, to keep up a good earth mulch until it is time to seed. If at that time the surface three or four inches of soil is loose and moist, and there is a solid bed of moist soil underneath this loose surface, then it doesn't matter much, say many extensive alfalfa growers, how you proceed to get the seed under the ground. We have had the best results on the Agricultural College farm by using a press drill, and mixing the seed with an equal weight of wheat bran. But the principal thing is to sow alfalfa, and sow it until you get a field.

J. H. HANEY.

Kansas Agricultural College.

WHY SHOULD DAIRYMEN SUBSCRIBE FOR THIS PAPER?

1. Because a live dairyman needs such a paper.
2.—No other paper in the world bestows as much labor and expense to set the best dairy ideas, methods and facts before its readers.
3.—A dairy farmer with a herd of cows who has not enough interest in his own welfare to spend a dollar a year for his instruction is standing in his own light.
4.—Because the DAIRYMAN has been the foremost defender of its age against the fraud oleomargarine. Every dairyman should have interest enough in this feature alone to keep the paper on his table constantly.
5.—Because fifty-two numbers of this paper contain over 4 000 separate subjects on dairying. At the close of the volume an index telling the page of every subject is printed and furnished every subscriber. This makes it the finest and largest book on dairy matters for the money, ever published.
6.—Because there is not a single number but what contains something of great value to every reader.
7.—Every man who has to do with cows should have such a friend and adviser at his elbow constantly.

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name, Post-office and state of writer. Condense the questions into plain specific inquiry. Be careful to note if your questions have not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

GLOSSARY.

The terms used in this department of HOARD'S DAIRYMAN have the following significance:

RATION.—The total allowance of feed for twenty-four hours.

DIGESTIBLE NUTRIENTS.—That portion of the organic matter which can be digested by the animal and does not pass off through the bowels as excrement.

PROTEIN.—That part of the digestible nutrients which goes to the formation of lean meat, ligaments, hair, horns and the casein (or curd) of milk. It is generally believed, also, that protein may be, and many times is, converted into the fat found in milk. The basis of protein is nitrogen, hence the protein elements are frequently termed the *nitrogenous* parts of the food. They are also called *albuminoids*.

CARBOHYDRATES.—That part of the digestible nutrients which is the primary source of sustaining animal heat and furnishing the power for keeping the animal mechanism in operation. They are composed of the woody fibre of the plant and grain, and the starch, sugar, gums, etc, and in the published tables of chemical analyses are usually subdivided into the terms *crude fibre*, which is the least digestible portion of feeding stuffs and *nitrogen free-extract*, so-called because it does not contain any nitrogen.

ETHER EXTRACT.—That portion of the digestible nutrients which may be dissolved out of the food stuffs by ether. It is frequently called *crude fat*. Whether fat is actually digested and thus passed on into the circulatory system in a changed form, or whether it is simply separated from the other elements and always maintains its identity is an unsettled problem. It can be used by the animal for maintaining the body temperature, and for this purpose is from 2.2 to 2.5 times more efficacious than the carbohydrates. It is maintained, by some, that the fat in the milk comes, largely, from the crude fat in the food, but it has been demonstrated that it is not absolutely necessary for this purpose.

FEEDING STANDARDS FOR MILCH COWS.

	DIGESTIBLE NUTRIENTS		
Dry matter.	*Protein*	*Carbohydrates.*	*Ether extract.*
lbs.	lbs.	lbs.	lbs.
23 to 28	2.0 to 2.5	12. to 15.0	0.5 to 0.8

DISTANCE OF BOILER AND ENGINE FROM THE BARN.

How far or close to a barn and stable would it be advisable to set a boiler and engine for the purpose of running a milk separator and churn. Our buildings are now twenty-three feet apart. Fire is all we are afraid of. E. J. R.

Bothell, Wash.

It will depend considerably upon whether your boiler is provided with spark arresters, etc., and also whether the exhaust from your engine discharges into your boiler stack or not. Unless provisions are made for arresting sparks, a boiler would be dangerous anywhere within working distance of a barn or stable.

We should consider that a gasoline engine would be much safer for work in or near a barn. The waste heat from the engine can be made to heat water for the dairy.

CHURNING RICH CREAM.

Can cream of richness of 35 to 40% be churned and is it good practice, without addition of water? We will presume that the temperature is low enough and that the churn is not filled more than one-third with cream.

San Francisco, Cal. H. C.

If you can secure the proper churning temperature, it is an advantage to churn rich cream. With 35% of fat the temperature of the buttermilk should be 50° to 52° when the churning is ended. Under above conditions you will not only have a better quality of butter, but there will be less buttermilk and a smaller per cent of fat left in it. If, however, you intend to handle such rich cream, be sure that your churning temperatures are correct or you will lose more fat in your buttermilk than you can afford.

SILO QUESTIONS.

I am going to build a silo this spring and would like to know which would be the best place to build it, and the cheapest. I can build it in the barn or I can put it on the outside. Which is the best, and how large a one do I want to hold enough silage to winter twenty-five head of cows, all well bred up in the Jersey line. Would you feed it twice a day or only once? A. B. W.

Coryland, Pa.

The best place for a silo will depend much on the local conditions. As a general thing, the silo is put just outside of the barn so that it can be filled from the outside and have the feeding doors open directly into the barn. The cost will depend on the style of silo and kind of wood used and will be from $1.00 to $1.25 for every ton of silage it contains. A hundred ton silo will cost from $100 to $125, depending on plan and method of construction. For twenty-five cows, you will require ninety tons of ensilage, which will require a silo 16x25 feet deep, if the silo is round. Feed your Jerseys twenty to twenty-five pounds of ensilage per day, in two feeds, night and morning.

ACID FOR BABCOCK TEST.

In testing milk with a 4 bottle Ideal Babcock tester, is it best to use chemically pure acid or the commercial acid, and of what strength? An answer to the above questions in your paper, will greatly oblige a reader.

Salem, Ind. O. B.

Use commercial sulphuric acid of the correct strength (specific gravity 1.82 to 1.83). The important point is to get the acid of the correct strength, and see that it is kept in closed bottles, so that it will not deteriorate.

WILL A COW LAST AS LONG?

An Albany county (N. Y.) reader asks whether a cow fed a balanced ration to her full capacity will last as long as she would if fed less.

This is apparently a fair question, but none the less it raises a false issue. We do not keep cows for length of years, but for the profit we can get out of them. If by feeding a cow a balanced ration and to her full capacity, she will yield us more profit in 10 years than she otherwise would in 12 or 15 years, then it is better to do so. The fact is, however, that there does not appear to be any shortening of the period of a cow's usefulness by feeding a balanced ration, and crowding her to a reasonable maximum of production.

Some cows have been permanently injured and their lives shortened by unduly forcing them to the extremest limit of milk giving, but it still remains that the great majority of cows are under fed.

FOR AN OHIO MILKMAN.

It is now about six months since we commenced taking HOARD'S DAIRYMAN. It has been worth several times the subscription price and the only regret is that we did not commence taking it several years ago, when we first started in the dairy business. It would have helped us out greatly on the feeding question, for we consider that one of the main parts to profitable dairying.

We now feed and have fed for several months, 30 pounds silage, 3 pounds bran, 1 of linseed meal and all the hay they will eat. Instead of bran, we sometimes feed brewers malt. Do you consider the malt a good feed? Does it produce good and wholesome milk and what change would you recommend in our feeding system?

We sell milk in the city; have a good trade and endeavor to sell the very best, and in the very best condition possible, and seldom have any complaints, excepting during this time of the year, we have had trouble for three successive years, of milk not being as good a quality as at other times. We are unable to find the cause. We feed exactly the same and give them the same care. Now we will be very gratetul if you can help us out of this trouble.

Fremont, Ohio. J. G. S. & SON.

The 3 pounds bran and 1 pound oil meal must be the amount given at each feed; and the daily allowance at least double these amounts. Brewers malt, if fresh and sweet, is an excellent feed for dairy cows, as a part of their ration, and produces good and wholesome milk—Boards of Health or other officials in cities to the contrary notwithstanding. There is a difference between brewers grains and malt sprouts, although neither are objectionable, if given in limited quantities.

The alleged objections to the milk are probably not well founded, if they go only to the question of richness, or amount of cream that will rise. The milk is as rich in fat at this time of the year as any other, but it has less color, and color is the test usually applied to determine quality. But color is a very misleading test for this purpose; in fact no test at all.

On the other hand, if the objections are based upon the keeping quality of the milk or the presence of unpleasant odors or flavor, the trouble may come from lack of proper ventilation in the stable or care of the milk, but not from the feed. More generous feeding would probably increase the quantity of milk, and we would advise adding 3 to 4 pounds of the malt per day to the allowance mentioned above, or, if the so called malt is in fact the wet grains, add 15 to 20 pounds. It pays best to feed good cows liberally.

TERMS EXPLAINED. A VERMONT RATION.

What do you mean by corn stover, corn chop, stover, etc? This may be plain to some people, but the farmers here are of different opinions about it?

I wish, also, to find the best ration formed from my crops on hand. Ensilage in one silo, corn and stalks all cut together. No. 2 silo, stalks from husked corn, corn and cob meal, rye meal, ground oats and bran at $18 per ton. Can you formulate a ration from this. Of course we have plenty of hay. If you will answer this through your paper, you will greatly oblige ESEK BUSSEY.

Vt.

Corn stover, sometimes called "stover" for short, consists of the dried stalks of corn from which the ears have been removed; corn fodder consists of the entire plant, either green or cured. Corn chop is more or less of a local term used to signify ground corn, or unbolted corn meal, and usually not very finely ground.

We often regret the necessity for using technical terms, but it seems indispensible to do so. Most of them, if not all, will be found fully defined and explained in any of the modern dictionaries, and no house can be considered well furnished, that is not supplied with an up-to-date dictionary, placed convenient for reference, and the habit of consulting it should be diligently cultivated.

It is simply impossible to give a satisfactory ration formula from the feeds named, or one that it will be profitable to feed. We should certainly exchange the corn and rye, and possibly the oats for gluten feed, or cotton seed meal, or both, and if the cows are fresh, or nearly so, would feed for an average about as follows:

FORMULA FOR RATION.	*Dry Matter.*	*Digestible Nutrients*		
		Protein.	Carbohydrates	Ether Extract
20 lbs. silage	5.28	26	2.80	.14
10 lbs corn stover	5.95	.17	3.24	.07
6 lbs. hay	5.15	.29	2.38	.10
4 lbs. bran	3.52	.50	1.54	.12
2 lbs. gluten feed	1.84	.41	.97	.06
2 lbs cotton seed meal	1.84	.74	.34	.18
Totals	23.58	2.37	11.27	.67

Our correspondent, as we judge from his penmanship, is a man well advanced in years, and, probably, not without very considerable experience in former years, in feeding cows. He has broken away from the old traditions so far as to build a silo, and we trust will not hesitate to take the further step, at least, in an experimental way, of supplying some feed for his cows better adapted for enabling them to make milk, than corn and rye.

If the gluten feed specified in our formula cannot be conveniently obtained, try some kiln dried brewers' grains or buckwheat middlings.

AYRSHIRES.

Will you please state:

1. The special characteristics of the Ayrshire breed of cattle, as compared with other dairy breeds?
2. Where most numerous in the United States?
3. Why not more generally introduced in the west? W. W. S.

Waverley, Iowa.

The best answer to the first inquiry above is to refer the inquirer to the article by Prof. Beach on page 152. We have not the data at hand for saying where they are most numerous, but would suggest that information in this line could probably be obtained from Mr. C. M. Winslow, Brandon, Vermont, Secretary, Ayrshire Breeders' Association.

Ayrshires were not uncommon in the west a few years ago, but breeders insisted on developing towards show points, rather than keeping to the true dairy type, with the result that the western representatives of this breed became unprofitable at the pail. A decided reaction has taken place in recent years, and we look to see Ayrshires become once more popular as dairy cattle in Wisconsin and adjoining states.

KAFIR CORN, PEAS, ALFALFA FOR NEW YORK.

1. Will kafir corn thrive and mature in this section, to be used for ensilage?
2. If not, would you advise to use it as a soiling crop?
3. Answer same question in regard to cow peas?
4. Also on alfalfa for ensilage, hay, or soiling crop. E. W.

Oswego Co., N. Y.

We do not know of any experiment on siloing kafir corn, but know no reason why it could not be used for silage, with as much success as sorghum. The great question would be as to its adaptibility to your climate and soil. It is a semi-tropical plant, and as such, requires an abundance of heat to mature.

Canada peas and oats should do well with you for a soiling crop. You are probably too far north for the cow pea, which requires a rather, warm, dry climate.

Alfalfa is reported to do well in New York, but requires special preparation of the land, and good seeding to get a good stand.

A NEW YORK RATION.

Will you kindly give me a balanced ration for cows from 900 to 1,200 pounds. Clover and timothy hay, good, at $15 per ton; barley sprouts, at $14 per ton; gluten, $17 to $18 per ton. I think cotton seed is about $26 per ton, but have not used any in a year

or so. I want this ration for quantity of milk. I have the hay but have to buy the rest. Would say that I have a plenty of ensilage. I am feeding now to twenty-two cows, about 80 pounds of barley sprouts and about 80 pounds of gluten per day. I wet the sprouts, or soak them about twelve hours before feeding. I feed ensilage twice a day, night and morning, and hay at noon, all they will eat. I put the sprouts and gluten on the ensilage, when I feed, and shake it up.

Carsville, N. Y. G. H. B.

With plenty of good clover and timothy hay on hand, we should be disposed to increase the amount and feed less silage, provided the latter is in condition to be kept until next July and August, to tide over the customary drouth and short pasturage. If it cannot be kept for this purpose, it will be advisable, of course, to apportion the daily allowance so that it will simply hold out until grass comes. We are of the opinion, also, that it would pay to add, at least, one pound of cotton seed meal per day for each cow. We estimate that the present ration furnishes less than two pounds of digestible protein per day, and this is believed to be less than cows in good flow of milk can profitably use.

PHOSPHATE OF LIME FOR ABORTION.

Seeing the suggestion of F. C. Baker, in regard to bone meal for abortion in your paper of Feb. 24, 1899, I concluded to act on the suggestion, as nearly all my cows are troubled with the disease. Would like to know in what quantity it is to be given.

Weber Co., Utah. P. A.

Use a heaping teaspoonful three to five times a week. Mix it with salt and sprinkle on the feed.

FEEDING SILAGE THE WHOLE YEAR ROUND.

Would like to feed ensilage the whole year round. Some people tell me that it will soon wear my cows out. I want to keep them in the stable all the year; let them out in the morning, and give them about two hours exercise in the lot.

They have water before them all the time. A light and well ventilated stable. I want to feed about 30 pounds of ensilage, 10 pounds of clover hay, 3 pounds of wheat bran, 3 pounds of gluten, 2 pounds of cotton seed, to a 1,000 pound cow.

Do you think that a cow that is fed ensilage the whole year through, will yield as long and as much butter as one that is fed enough corn stover and clover hay and grain to make a balanced ration in winter time and left out on pasture in summer time?

We breed our heifers from our best cows, and then we keep all those heifers that yield a profitable amount of butter, and those that do not, we fatten and sell. So we want our good cows to last as long as profitable.

Montgomery Co., Pa. F. M. L.

So long as you keep your cows in a comfortable, well lighted stable, and feed your ensilage as part of a balanced ration, there is no danger of your cows wearing out in consequence of the silage. It is much more wearing to a cow to pick up a living from a dry pasture where she is tormented by flies and heat; or getting nourishment from poorly cured corn fodder in a cold barn, than can possibly come from good shelter and a good quality of silage; and the yield of milk and butter will be less. Yet the men who are down on the silo, do not hesitate to use the other two methods of feeding.

RENTING LAND ON SHARES.

Will you or some of your readers give us a plan in which both lessor and lessee are fairly dealt with, where land and part of the cows belong to lessor, and all the labor is to be done by lessee. Milk or cream hauled to creamery. J. I. A.

Corvallis, Ore.

Much will depend upon what method is pursued in dividing the crops—that is, whether the stock is to be fed from the undivided hay and grain, or whether the tenant is to furnish all the feed.

When the whole energy of the farm is devoted to dairying, and only the surplus hay and grain (if there should be any) is divided or sold, it is usual, we believe, to divide the proceeds equally, share and share alike between the owner and the tenant, each being also at one-half of all necessary expense for extra feed.

CREAM CURDLING WHEN WARMED.

What will make cream curdle in hot drinks long before it has any signs of being sour? The cream seems to do this more when the weather is a little warm than at other times. Sometimes the curded cream will settle to the bottom of the cup. O. W. L.

Los Angeles, Cal.

Old cream will frequently curdle on heating before it shows any signs of separation of the casein. In this condition it is just on the edge and will curdle, if left standing, in a few hours.

Aeration of the milk and keeping the cream as cold as possible will remedy the trouble.

MODIFICATION OF A NORTH DAKOTA RATION.

Prairie hay $3 per ton, bran $8, corn 37 cents per bushel, oil meal $30 per ton. I am feeding at present 4 pounds corn meal, 10 pounds bran, 2 pounds oil meal, and what prairie hay they will eat. If you do not consider this profitable, please form one for me. Bran and shorts, equally mixed, may also be added to the list at $10 per ton.

Havana, N. Dak. H. E. A.

Profit is determined by the return each cow makes for the feed she eats. We estimate that cows fed as above will eat about 12 pounds of hay, and such a ration would tabulate as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
12 lbs. prairie hay	10 50	.42	5.02	.17
10 lbs. bran	8.81	1 26	3.86	.30
4 lbs. corn	3.56	.32	2.67	.17
2 lbs. oil meal	1.82	.59	.65	.14
Totals	24.69	2 59	12.20	.78

The price of oil meal is much in excess of its feeding value, and unless needed for its hygienic effect should be materially decreased, if not dispensed with altogether. If one pound of oil meal were taken away there would remain sufficient protein and fat, for average feeding. The corn is also relatively expensive, costing over $13 per ton, and might be exchanged with profit for middlings. The present ration costs about 11½ cents; 20 lbs. of hay, 5 lbs. each of bran and middlings, and 1 lb. oil meal, only 7 cents, and we incline to the opinion would be found more profitable. Some changes in this direction, at least by way of experiment, would seem to be advisable.

AN ARKANSAS RATION.

Please form me a balanced ration of the following foods for common stock milk cows, have only three, and these for family use: Cotton seed meal $18 per ton, wheat bran $17 per ton, corn meal $19 per ton, ship stuff $17 per ton, clover hay $14 per ton, timothy hay $14 per ton, Bermuda and swamp grass hay $10 per ton, cotton seed hulls $2 per ton.

Helena, Ark. H. G.

Allow 6 lbs. bran and 2 lbs. cotton seed meal to each cow per day, with 10 lbs. clover hay, and as much other roughage as she will eat, only do not let too much of it be the cotton seed hulls.

MILKING A HEIFER BEFORE CALVING.

I have on my Dakota farm four nice grade two-year-old, this spring, Guernsey heifers. They are all due to calve the last of this month. My foreman wrote me last week that their udders were very large, and he was milking them once a day. I wrote him that I thought he had made a mistake, but that he would have to milk them until calving, but not to do so again, unless HOARD'S DAIRYMAN recommended it. I got a letter from him yesterday saying he was now milking them twice a day. Now, I have never milked a cow before calving, and it has always been my belief that it was harmful to the cow, especially a heifer with her first calf. What do you say, am I right, or does my foreman know more about than I do?

Many years ago Gov. Hoard said so much in favor of the Guernsey stock, that I bought a full blood bull. I have not been disappointed in their milking qualities. But if the heifers have to be milked before they have calves, and it is not possible to dry them up afterwards, what is a fellow to do? My foreman writes that he can't dry up the old cows.

Painville, Ohio. A. E. F.

Having once commenced to milk there is no other safe way except to continue milking. It sometimes happens, that heifers will make up very considerable udders for a time and if left to themselves the swelling will go down, as there is, in fact, no milk secreted. Just a little manipulation, however, will start the secretion, and after that, as said above, there must be regular milking. The same conditions are observed in cases of abortion. Very frequently, if the udder is not touched, no milk will be formed and the udder soon resumes its normal condition, but, in any case, when milk is elaborated it should be drawn. And we may add, contrary to a very wide spread belief, this milk is perfect in every respect, and good for any purpose.

AN ONTARIO RATION.

Please form me a balanced ration of as many of the following feeds as you think will give the best returns for money expended, for cows of 1,000 pounds. Mixed clover and timothy $6 per ton, oat straw $3 per ton, good corn silage, bran $14 per ton, oats 30 cents per bushel, corn chop $18 per ton, cotton seed meal $23 per ton, gluten feed $18 per ton, germ meal $14 per ton, oat dust $8 per ton. M. R. & SON.

Caledonia, Ont.

At the prices given, we should select as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
25 lbs. silage	6.60	.33	3.50	.18
10 lbs. clover hay	8 47	.68	3.58	.17
6 lbs. oat dust	5.61	.53	2.30	.30
2 lbs. cotton seed meal	1.84	.74	.34	.18
Totals	22.52	2.28	9.72	.83

Add to the above whatever of good oat straw any cow will eat.

Germ meal contains only 9% of digestible protein, which is less than half as much as gluten feed carries, but is somewhat richer in fat. If the cotton seed meal is not fresh, clean and sweet, do not use it, but substitute 3 pounds of the gluten feed.

Hominy chop is a by product of the mills where hominy is made, and contains 7.5% digestible protein.

A NORTH CAROLINA FEEDING PROBLEM.

Will you please formulate me a ration, for my Jersey cows, of peavine hay, shredded corn fodder, (shuck and stalk,) wheat bran, at $17.50 per ton; corn meal, $22.00 per ton and cotton seed meal, $18 50 per ton. The grain ration I have to buy; the hay and stover I have on the farm.

I make butter that nets me 21 cents clear of express charges. J. F. C.

Davidson, N. C.

If to 10 pounds of the peavine hay and 10 pounds shredded corn stover, there be added 4 pounds of wheat bran and 2 pounds of cotton seed meal, there will be sufficient digestible protein for a day's feed. The carbohydrates and fat would be rather low for our northern climate, or the higher altitudes in North Carolina. This deficiency would be best supplied by adding some ground corn, the amount to be determined by circumstances.

FEEDING FOR A BIG RECORD.

I have a cow that has given seventy-two pounds of milk in one day. This season I want to push her for a bigger record. What would you advise me to feed? She will be fresh April 1st. I have bran, oil meal, corn

"Want of Watchfulness Makes the Thief."

Many cases of poor health come from want of watchfulness. But if you keep your blood pure no thief can steal your health.

The one effective, natural blood purifier is Hood's Sarsaparilla. *It never disappoints.*

Impure Blood—"Five years I suffered with pimples on face and body. Hood's Sarsaparilla cured me permanently. It also cured my father's carbuncles." ALBERT E. CHAST, Tustin City, Cal.

Catarrh—"Disagreeable catarrhal droppings in my throat made me nervous and dizzy. My liver was torpid. Hood's Sarsaparilla corrected both troubles. My health is very good." MRS. ELVIRA J. SMILEY, 171 Main St., Auburn, Maine.

Hood's Sarsaparilla
Never Disappoints

Hood's Pills cure liver ills; the non-irritating and only cathartic to take with Hood's Sarsaparilla.

GLUTEN FEED.

CHAPIN & CO., Milwaukee, Buffalo, Boston, St. Louis. Manufacturers' Agents for GLUTEN FEED. This is the best and cheapest milk-producing feed for the money. Contains 26% digestible protein. It keeps sound and sweet. Sold in car lots. Inquire of your grain dealer. Price based on its milk-producing value. For Wisconsin orders address CHAPIN & CO., Milwaukee.

DON'T BUY COTTON SEED MEAL

Unless guaranteed analysis is attached to each bag.

The American Cotton Oil Co.'s

Cotton Seed Meal carries a red tag showing guaranteed analysis to be not less than

Ammonia	8.50%
Nitrogen	7.00%
Protein	43.00%
Crude Fat and Oil	9.00%

See that the name of the American Cotton Oil Co. appears on the red tag.

ECLIPSE Cream Separators

SUPERIORITY over any other make GUARANTEED; they are CLOSEST SKIMMERS and Built DOUBLE AS STRONG as any other make; also easiest to wash and operate. See and try one before buying. Ten sizes. Prices $30 to $600. Reliable Ag'ts wanted. Catalogue FREE.

C. L. Chapman Separator W'ks, ERIE, PA.

When writing mention HOARD'S DAIRYMAN.

FENNER'S Revolving Six-sided CHURN.

Churns, washes, works without removing. Nine dairy sizes always in stock. Special attenton given to factory sizes. Send for catalogues.

R. W. FENNER, South Stockton, N. Y

Year After Year Creamery and Cheese Factory owners are duplicating their orders for CHAMPION Milk Coolers, supplying every new patron they take on—won't take milk that is not aerated and cooled they say—can't afford to.

Are you using them at your factory? Why not? Ask for our free book "Milk."

CHAMPION MILK COOLER CO., 67 Main Street, CORTLAND, N. Y.

and oats ground, clover hay and corn fodder. I don't care what it costs, but want to get as big a flow of milk as possible.

Bedford, Iowa. H. L. E.

We are not much in favor of this extreme "pushing" for the largest possible record. Many a first-class cow has been ruined by such treatment. We give below what we consider a formula for a good ration, that will enable a dairy cow to do excellent work, continously for months, and leave her, in condition to do equally well next year:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
15 lbs. clover hay....	12.70	1 02	5.36	.26
5 lbs. bran.....	4.40	.63	1.93	.15
2 lbs. corn.....	1.78	.16	1.33	.09
2 lbs oats.....	1.78	.18	.94	.08
1 lb. oil meal.....	.91	.29	.23	.07
10 lbs. stover.....	5.95	.17	3.24	.07
Totals.....	27.52	2 45	13.13	.72

With such a ration as this for a basis, (and this much should not be fed at the beginning) one may increase gradually as the cow will eat, and take care of what she eats, until the grain allowance is doubled, meantime decreasing the roughage, especially the corn stover, to make room for the grain. We would commence the increase with the oil meal and oats, then follow by increasing the corn. This will bring the grain up to 15 pounds. What to feed next, by way of increase, will depend upon the condition of the cow. If the bowels are not too loose, add to the oil meal, and follow again with oats and corn.

Give salt in moderation every day, and whenever the cow leaves any of her feed uneaten, remove it at once, and give her fresh feed for the next meal. Whenever she exhibits the least reluctance to eat, you may be sure, the limit has been passed, at least, for the time being, and the amount placed before her should be reduced.

HEMLOCK FOR SILOS.

J. M., of Addison, Vt., writes:

1. What shape or form is the best in use up to date?

2. Would hemlock be durable in a tub silo, or would you recommend pine at $4 00 per thousand more?

3. Is planing necessary?

4. How much would a silo 15 feet in diameter and 25 high hold?

5. How would you joint the staves, provided they were 12 and 13 feet long, and would it be necessary that they be full two inches thick?

We submit replies as follows:

1. Circular.

2. Hemlock is preferable to pine.

3. Planing is desirable, but not indispensible.

4. Eighty tons.

5. This is best and cheapest done by running them through machines made for that purpose. Otherwise, let a carpenter do it with a plane. Do not bevel the edges. Two inches is better than less, and 4 to 6 inches wide.

MUCK LAND FOR CORN.

Have purchased a farm, on which there is about 20 acres of muck land, that has not been worked for 10 to 15 years. This was cedar and black ash swamp. Would you advise me to plant the whole to corn, or half of it, and take ten acres of hard land? I intend to raise twenty acres of corn, so I have no meadow this year. Would you advise me to try some millet on a part of this muck? Is it good feed for milch cows? This land raised good crops when it was worked. I can run the surface water off, but it will stop in the ditch, about 8 inches to a foot from the surface for a while.

Addison, Vt. J. M.

There is an old proverb about not putting all one's eggs in a single basket, but this was before the days of the modern egg cases and carriers, and is somewhat out of date as to eggs. The advice was good in its day, and the principal of it may be applied to the case submitted; hence we would not deem it prudent to trust one's entire crop of corn on this low ground. Millet makes good hay for cows, if cut before the seed forms, but when left too long it is practically worthless, and sometimes dangerous.

BEAN PODS.

I am feeding my cows a balanced ration or nearly so. There is one item however, of which I am in doubt, and that is 5 lbs. bean pods. I could not find an analysis of them so put them in the same as corn stover. However, as beans are rich in nitrogen and as the pods seem to be a very rich, heavy feed, and very laxative, and all kinds of stock seem eager for them, it has occurred to me that this item in the ration might "spoil the combination," as it were. Kindly help me out.

Ontario Co., N. Y. F. B. A.

The principal effect of the bean pods would be to increase the amount of digestible protein in the ration. The only analysis we have found shows them to contain digestible nutrients as follows:

Protein..... 7.83 per cent.
Carbohydrates.....79.38 per cent
Crude fat.....1.02 per cent.

If this is correct these pods have a feeding value practically equivalent to shelled corn, instead of corn stover. The pods can be fed, however, much more freely than ground corn, because they are so much lighter.

ACREAGE OF CORN FOR FILLING SILO.

How many acres of corn will it take to fill a silo 20 feet in diameter and 34 feet high; also what is the best variety of corn to plant? B. F. McM. & Bro.

Marathan Co., Wis.

To fill a silo of the above size will require 225 tons of green corn. The average yield of corn per acre at the Maine Experiment Station, was 34,761 lbs. for dent corn and 22,269 lbs. for flint corn. Taking the above figures it will require about thirteen acres of dent corn and twenty-two acres of the flint. To raise dent corn so far north would require an early variety, such as the eight-row. Unless you intend feeding a large herd of cattle, it would be better to build two smaller silos, —say 18 by 24 each—than the one large one.

Allow for six square feet feeding surface per cow per day.

A HALF SCORE OF NORTH CAROLINA QUERIES.

1. Does a cow that has tuberculosis shed off?

2. Does she fatten easily when dry?

3. How does the disease affect the eyes?

4. Does tuberculosis show in its worst form in winter or summer?

5. Does a cough always accompany this disease?

6. Will a cow that has been gorged badly on concentrated feed get over it?

7. Do you consider cotton seed hulls injurious to cows? I notice you never put them in a ration if you can get something else.

8. Are Jerseys more liable to tuberculosis than Holsteins?

9. Does a straight face not dished at all detract from a dairy cow?

10. Would you advise mixing Holsteins and Jerseys? J. L. A.

Rockingham, N. C.

1. Yes, unless the disease is very far advanced.

2. Same as above.

3. Not at all.

4. Seasons make no particular difference.

5. No.

6. No, unless properly attended to at the time.

7. Not injurious, but of no great value. They are difficult of digestion, and yield comparatively little nutriment. In the absence of other roughage they serve a good purpose in properly distending the stomach.

8. No.

9. The dished face is, of itself, unimportant, except as indicative of large prominent eyes, and these in turn betoken nerve force.

10. No.

Warm vs. Cold Water for Cows.

At an experiment in England they found that a herd of 30 cows gave a profit of $15 per week more when the temperature of the barn was kept at 63° than when it was kept at 52°. If this is so, we wonder what the profit would be, or if there would be any, in a barn where the temperature fell below 32°, so that the manure froze behind the cattle. We believe it would be a loss, and if the time when it is so cold lasts but a few days, it is not easy to bring the cows back to giving as much milk as they did before the shrinkage began.

A writer in the *Dairyman* reports an experiment made with cows which had free access to water from a spring in the side hill, piped into a tank which never freezes. Four of them were given, after supper, as much warm water as they could drink, and they took from one to three gallons each, after having had what they wanted at the tank. The daily gain in milk was from 29 to 32, 25 to 26, 26 to 28, and 20 to 21½ pounds, respectively, or 8½ pounds for the four cows. The gain was kept up as long as the warm water was continued. What would have been the gain if all their water had been warmed? We think it would have been more than twice as much, as some years ago we reported results in a dairy where all the water at the troughs was heated, and the results, as we remember them, were that the record of milk sold was some two or three quarts per day, as an average for each cow, more than the same herd had given the winter previous. As the milk was all sold the record was easily shown by the monthly receipts, and with a herd of 20 cows it was an important item. It more than paid for the fuel, and the day's wages of the man who kept up the fires, though it took but a little of his time twice a day.

These three experiments are all given together, because we do not believe the use of warm water would give such results, if the barns had been so cold that water would freeze in them, though it might prove of some benefit. Make the barns warm first, and then try warming the water. The increased profits will soon be enough to pay for a new barn if there is a good market for milk or milk product.—*Ex.*

Experience Wanted.

Ed. Hoard's Dairyman:—What is the cheapest and best rough feed a dairyman can raise on upland soil, when he has no clover hay to make. I find it expensive to buy clover hay, even as cheap as it has been this winter.

I will have to buy my next winter's rough feed, and would like to have the experience of others as to some crop I could raise this spring, that would take the place of clover hay. I have no silo. Would like to hear from someone that has raised oats and peas for hay and their mode of raising same.

Marion, Ind. A. D.

The Oleomargarine Law.

The partisans of oleomargarine do not plead their case fairly. The law does not forbid any one who pleases selling oleomargarine as oleomargarine. What it does object to is the sale of oleomargarine as butter, to those who want butter and pay for butter. —*Louisville Courier-Journal.*

Put Your Finger on Your Pulse

You feel the blood rushing along.

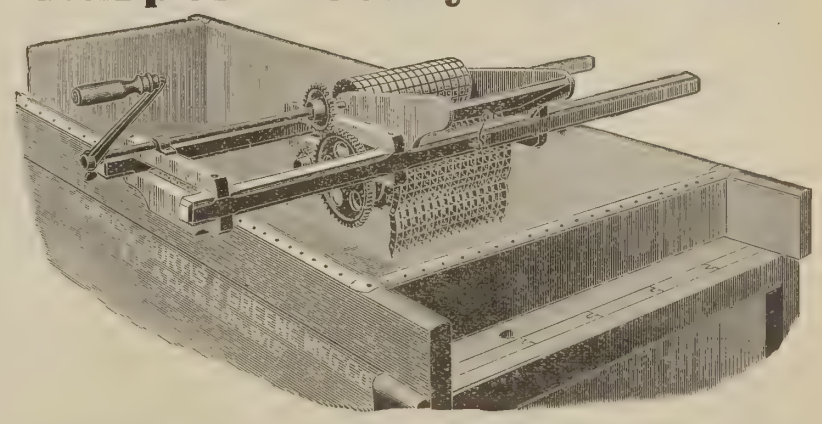
But what kind of blood? That is the question.

Is it pure blood or impure blood?

If the blood is impure then you are weak and languid; your appetite is poor and your digestion is weak. You cannot sleep well and the morning finds you unprepared for the work of the day. Your cheeks are pale and your complexion is sallow. You are troubled with pimples, boils, or some eruption of the skin. Why not purify your blood?

Ayer's Sarsaparilla

will do it. Take it a few days and then put your finger on your pulse again. You can feel the difference. It is stronger and your circulation better. Send for our book on Impure Blood.



If you are bilious, take Ayer's Pills. They greatly aid the Sarsaparilla, They cure constipation also.

Write to our Doctors.

Write them freely all the particulars in your case. You will receive a prompt reply, without cost.
Address, DR. J. C. AYER, Lowell, Mass.

Kasper Rotary Curd Mill.

The demand for a large capacity curd mill for cutting curd into cubes has induced the inventor to bring out the Kasper Mill. In construction the mill consists of a rotary cylinder made of knives in the form of cubes Against these knives a wooden roll revolves with indentations to fit the knives of the cylinder; the curd being fed into the hopper is forced through the openings in the cylinder by the wooden roll The cylinder is made in three sections hung on hinges, and, as it revolves, each section as it comes to the lower part of the cylinder, opens and allows the curd to drop into the vat, the section closing again as the cylinder revolves.

It is estimated that the curd from 7,000 lbs. of milk can be cut in from 7 to 10 minutes. The mill operates easily, being light running and adjustable to either hand or belt power. Simplicity of construction, durability and ease of cleaning are some of its principal features. All parts being galvanized or tinned prevents rusting. Weight of the machine complete is about 38 pounds. List price, $25.00.

CORNISH, CURTIS & GREENE MFG. CO., Fort Atkinson, Wis.
Inventors, Manufacturers and Dealers in Everything Pertaining to Butter and Cheese Making.
Agents for DE LAVAL ALPHA SEPARATORS.

THE contract prices for milk at the New Berlin, N. Y., milk condensory for the next 6 months are as follows: April $1 per 100 lbs.; May 80 cents; June 70 cents; July 80 cents; August 90 cents; September $1.10.

These prices are just about what the milk nets the patrons in first-class creameries, *provided* the patron is an intelligent feeder of the skim milk, and provided further the creamery returns the milk in the highest feeding condition. There is still an advantage to the creamery not yet spoken of, that of keeping up the fertility of the farm. It is simply astonishing how quickly those farms in the eastern states have lost their producing power, where the whole milk has been constantly taken from them, either for city use, cheese making, or in condensory work. We know of hundreds of farms in New York that will not to-day produce one-half the grass or grain, without the use of expensive fertilizers, that they would forty years ago. These farms have been used as dairy farms, either in cheese making or milk shipping, almost continuously for all those years. In the butter making districts of Delaware and other counties the soil shows much better. Yet there are a vast number of farmers in that and other eastern states who seem to possess but little, if any, idea of the feeding and fertilizing value of the skim milk.

Type More Important Than Breed in the Production of Milk as Well as Butter.

ED. HOARD'S DAIRYMAN:—Since the report of the record of Storrs College herd appeared in the DAIRYMAN of March 24th, I have been asked several times if the type was more important than breed in determining the profit for milk, as well as in the production of butter. It is good practice I believe, not to attempt to demonstrate too many things in one experiment, and so I confined my attention to a sing'e proposition.

However, the data are at hand for a comparison of the types and breeds, as to the cost of milk per one hundred pounds, as well as net profit from sale of same, as milk. Anyone with pencil and paper could easily make the comparisons themselves. I have done so in the accompanying table for the benefit of those who have not already made this comparison:

	(1) No of Cows.	(2) Cost of food one year.	(3) Milk Produced one year, lbs.	(4) Cost of 100 lbs. milk. Cents.	(5) Net profit with milk at $1 per 100 lbs.	(6) Net profit with butter at 18 cents per lb.
For entire herd	25	$40.80	5,655	72	$15.75	$15 50
AVERAGE OF BREEDS.						
For Ayrshire	4	$40.65	6.166	66	$21.01	$ 7.22
For Jersey	4	43.35	5,982	72	16.47	23.47
For Grade	14	39.37	5.523	71	15.86	16.46
For Guernsey	3	41.39	5,140	80	10.01	11 46
AVERAGE OF TYPES.						
For typical dairy type	2	$46.67	8,511	54	$38.44	$4: 62
For dairy type	14	40.94	5,859	69	18.00	18.62
For lacking digestive capac'ty	5	39.83	5,322	74	13.39	8 28
For beef type	4	38.59	3.918	98	loss .59	loss .55

In the above table, column one gives the number of cows in each breed or type; column two, the average cost of food for one year; column three, average pounds of milk yielded; column four, the cost of 100 lbs. of milk in cents; column five gives the net profit from sale of milk at $1 per one hundred pounds; and column six, the net profit from sale of butter at 18 cents per pound.

It will be noticed that there is a transposition in the relative position of the breeds. The Ayrshires stand at the head in the amount of milk produced, cost per 100 lbs. of milk, and in net profit from sale of milk.

The type, however, is still the determining factor in the economical production of milk, as well as in the production of butter.

In comparing breeds with types:

1. In the food cost of each 100 pounds of milk, the Ayrshires charge 66 cents per cwt., while the Guernseys charge 80 cents per hundred, or a difference of 14 cents. The variation due to type is 44 cents.

2. In a similar way the range in net profit between the breeds from the sale of milk is $11, while the range between the types is $37.89.

3. In the amount of milk produced the Ayrshires lead with 6,166 pounds; the Guernseys produce 5,140, or a difference of 1,026 pounds. The range between the types in amount of milk produced is 4,593 pounds.

C. L. BEACH.

Storrs Ag'l College, Storrs, Conn.

Some Michigan Comments and Queries.

Mammary Veins on the Bull.—Stable Floors.—Soiling Crops.—Buckwheat Middlings for Swine.—Ration for Light Weight Jerseys.—Roots.

ED. HOARD'S DAIRYMAN:—I firmly believe in a special-purpose cow, and a special-purpose paper. In the DAIRYMAN we have the paper, and we are breeding for the cow.

I seldom write for publication, but have some questions which may seem foolish, but the wise need no teacher.

I have been interested in the discussion on the bull, (had a lively experience with one a few days ago).

1. You very wisely require large and tortuous milk veins in the dairy cow. Now, do breeders of dairy stock pay any attention to those veins in the bull? Are they ever, or should they be large and tortuous, so the same should be transmitted, etc?

2. Is the milk of a young heifer with first calf as rich in butter fat, as when fully matured?

3. I intend to build a cow stable. Which would be preferable, to make the whole floor of cement, or make a cement gutter, and a plank floor with the ends of plank just reaching over the edge of the gutter?

4. Am short of pasture, want to sow for this summer; which would be preferable to sow, corn, oats, millet, or a mixture, and if mixture, what?

5. If "a streak of lean" is desirable, and if protein is a lean flesh producer, why would not buckwheat middlings mixed with corn meal, make a good feed for the porkers?

6. Please formulate a ration for light weight Jersey cows of the following: Corn stover for roughage, corn meal at $16 per ton; buckwheat, middlings $12 per ton; wheat bran at $15 per ton; beets, golden tankard, and sugar beets at about $5 per ton. How would you balance these feeds, omitting the wheat bran?

I have no silo but raise several hundred bushels of carrots and beets, and feed beets to cows, horses, hogs, sheep, and hens, and our rats like them too. I have no use for turnips or "bagas", for butter production, unless I want the butter as white and tasteless as March snow, but I believe that carrots and sugar beets, or golden tankards are usually underestimated as stock feed. Potatoes make more milk per bushel than any other roots, unless it may be artichokes. Cabbage is also quite a milk producer, but I cannot speak as to the quality of milk from cabbage or potatoes.

J. E. K.

Michigan.

Mammary veins and well developed rudimentary teats are accounted "good signs" when selecting a bull, although there is something more than a suspicion that the veins, even in cows, have been given undue credit, and this more especially with aged animals, when they have become varicose and thereby unduly enlarged.

It is with stable floors as with everything—many men are sure to be of many minds. Personally we do not favor cement floors unless they can at all times be covered with plenty of bedding. This may be prejudice, insensibly engendered by reading about the "cold stone floors" in dungeons and otherwheres. What we do know is, that one of the surest ways to get cold feet is to stand on a stone floor, and we argue from this that the

Gluten Feed

is used by nearly all successful dairymen, and has become a necessary article for any dairyman farmer who wishes to keep pace with the successful men in his line of business.

Gluten Feed increases the flow of milk, improves the quality, keeps the cattle in the best possible condition,—in fact, helps you make more money out of your dairy. This is not cheap talk. We mean business. Gluten Feed is all and more than we claim for it, and, best of all, a trial proves it.

Sample of Gluten Feed, Milk Talk Pamphlet, and circular illustrating "Value of Butter Fat in Milk," all FREE if you address

PROVE IT. PROVE IT.

It is very easy for a butter maker to prove whether his butter is colored with an analine color or with

Thatcher's Orange Butter Color.

If you believe your butter to be colored with a poisonous analine dye, as fully one-third of the butter on the market is colored, then write us for the Davis Test, and we will send it to you free of charge. Any butter maker or butter user can apply it, and it will not cost him one cent to do so

The Thatcher Color is the best, the purest, the healthiest vegetable color on the market.

THATCHER MANUFACTURING CO., - Potsdam, N. Y

The St. Louis Journal of Agriculture says, editorially, as follows: "Much of the utter failure or want of complete success which attends the efforts of many farmers is traceable to the absence of business methods in the conduct of his operations on the farm and in his home. In these days of low prices and small profits it is only the exercise of economy and thorough knowledge of the details of his expenditures that will enable the farmer or business man to come out on the right side of his balance sheets. 'The Farmer's Record,' an account book intended exclusively for the use of the farmer, is certainly the best devised means we have seen to enable him to do this, and see his financial standing at a glance. The work is divided into several headings for all the items of income and expenditure on every branch of farm work, and also for the household. The farmer can keep a detailed cost of every crop he raises, and on the same page the income derived from its sale. There is also a record for mortgages for those who are encumbered with that incubus, with its date, amount and date of interest payable and the date of renewal of final payment. Altogether, the book is without a rival, and will prove invaluable to those who may possess it. There will be no excuse for the farmer who uses it to plead ignorance of his momentary affairs, for a few minutes devoted to posting up his 'Record' will always afford him a key as to how he stands financially."

The above books can be had by mail, post-paid, on receipt of $1.00.

J. T. NELSON, Brookings, S. D.

Land Plaster

NATURE'S FERTILIZER. The great stimulating element to the growth of cereals, plants, and all vegetation. In use for over one hundred years. The good results obtained from the use of **LAND PLASTER** have only to be understood to make it fully appreciated.

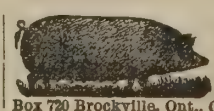
Michigan Land Plaster

IS NOT EXCELLED IN THE WORLD.

Farmers of WISCONSIN and MINNESOTA can obtain Fine Fresh Ground **Michigan Land Plaster** by the car load of **15 tons** and upwards, loaded on the cars at the Mills, Grand Rapids, Mich.

In bulk	**$ 1.00** per ton.
In American A grain bags	2.45 " "
In Stark A grain bags	2.70 " "

Shipping via car ferry at Muskegon a freight rate of **5 cents per 100 lbs.** can be obtained to Milwaukee, so that the plaster can be shipped in bulk and the expense of bags saved if desired. The railroads make special plaster rates from Milwaukee, which consignees should arrange for in making up a through rate to their station.



We have a large stock and can ship promptly at all times.

☞ **CASH MUST ACCOMPANY ORDER.**

MICHIGAN & OHIO PLASTER CO.,

401 Pythian Temple. GRAND RAPIDS, MICH.

cow that stands or lies down upon a cement floor has a cold as well as a hard platform.

The soiling problem was answered last week in reply to another correspondent.

Buckwheat middlings are good feed for swine.

Beets at $5 per ton are fully twice as expensive as corn silage. Every trial that has been made shows that more nutriment can be raised per acre and at less cost with corn than with beets, and we venture to say, without making any estimate that the silage can also be stored cheaper.

About the only combination that we can suggest for a ration from the feeds named would be the following.

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
20 lbs. corn stover	11.90	.34	6.48	.14
30 lbs. beets	4.05	.33	3.06	.03
4 lbs. corn	3.56	.32	2.67	17
6 lbs. buckwheat middlings	5 24	1 32	2.00	.32
Totals	24.75	2.31	14.21	.66

It would not be advisable to feed the grain as above without mixing it with the beets or some cut stover.

Our Special Elgin Letter.

ED. HOARD'S DAIRYMAN:—The offering of butter on Monday's Elgin Board of Trade aggregated 8,100 pounds. All bids were at 20½ cents, and the entire offering was quickly sold at that figure. The Quotation Committee declared the market steady at 20½ cents. The sales reported were as follows:

Factory.	Pounds.	Price
McConnell	1,080	20½ cts.
Red Clover	960	20½ cts.
Shattock's Grove	2,220	20½ cts
Malta	600	20½ cts.
Shabbona	1,140	20½ cts.
Belvidere	2,100	20½ cts.
Total	8,100	

The market for the corresponding week of the three preceding years were as follows:

April 4, '98, 1,320 pounds of butter sold at 22 cts
April 5, '97, 34,380 pounds of butter sold at 20 cts.
April 6, '96, 34,500 pounds of butter sold at 18 cts.

The New York market Monday was reported steady at 21 cents. H. C. B.

Elgin, Ill., April 3, '99.

Feeding Skim Milk to Cows.

Have any of your readers had experience in feeding skim milk from the separators back to the cows? Would I derive as much benefit from it as I would to feed it to pigs or calves? A. G. W.

Onondaga Co., N. Y.

The following extract from an article on dairying, by Mr. Menzo Wilcox, was published in the DAIRYMAN in 1897:

The feeding of all the skim milk and butter milk back to the cows that gave it, has been, in many respects a success with me. The skim milk contains nearly all the elements of whole milk, minus the fat, and with a proper grain added to supply this deficiency, can be converted into whole milk with less cow energy than any other food known. It is a perfectly healthy food and enables the cow to put in long years of usefulness with a much less amount of grain. It causes an increased and more continuous flow of milk through the entire year, so that many good cows cannot be dried off until it is taken from them. It does not have to be purchased, neither do you have to sow, reap or provide barn room for it. The cow furnishes it herself, it is always at hand, and will if rightly fed add to your dairy receipts more than if fed to anything else, except it be some highly pedigreed calves or pigs that can be sold at very fancy prices.

Too Much Oleo.

Recently the writer made a shipment of butter to Tampa, Florida, to a reliable commission merchant. While the butter netted a fair price, the merchant wrote as follows; "There is so much oleo here and it is so low, that it's a hard matter to sell good butter."

What is true of Tampa, is true of almost every large town in the South. There are no effective laws to keep the stuff out of our markets, or to compel the sellers to dispose of it under its true name. Thus it is that the southern dairyman is operating all the time under disadvantages, competing in price with a counterfeit article. Something surely must be done to protect the legitimate dairy interests of this country from the injury done by the sale of oleomargarine under the name and in the semblance of genuine butter.—*Southern Dairyman.*

A Water Refrigerator.

ED. HOARD'S DAIRYMAN:—I have a good flowing well at my creamery and would like some information about a water refrigerator. Could you or some of the subscribers give such from their own experience or that of others? Could spare an inch full all the time. S. H.

Wabash Co., Ind.

Alfalfa for Milk.

[Kansas Press Bulletin.]

Mr. C. Carlson, a patron of the Manhattan Creamery, milks three cows. Up to the 20th of February he had been feeding these cows one ton of alfalfa every 30 days, and had been sending to the creamery an average of 54 lbs. of milk per day, besides what was needed at home for the use of a large family. At this time, which was during the severe cold weather of February, his milk was testing 4 6% and butter fat was worth 17c a pound; we will estimate the skimmilk at the low price of 15c per 100 lbs; for 30 days this would amount to $14.84 or $4 94 per cow per month.

DAIRY MARKETS.

ELGIN, Ill., April 3.—Butter—Steady, 20½c. All offerings, 135 tubs, sold.

CHICAGO, Ill., April 3.—Butter—Creamery, western extras 21½c; firsts 20½@21c; state extras 21@21½c; firsts 20@20½c.

Cheese—State, full cream, large colored or white fancy 12@12¼c; choice 11¾@11¾c; choice 11¼@ 13¼c; small fancy 12¾@13c.

Eggs—Western 13@13¼c.

Cattle—Desirable grades of native and Texas cattle sold 5@10c higher, and good cows and heifers sold about that much higher. Trade was active and the commoner grades were steadier. Receipts hardly reached expectations, and "good" cattle were scarcer than any previous Monday this year. The top was $5.60, with two loads at $5.50. Strictly prime 1,400@1,500 beeves would bring $5.70@6.00; common to choice 920@1,565-lb steers sold at $4@5.45; bulk $4.70@5.30; fed western steers 1,060@1,521 lbs. $4.30@5 45: bulk $5@5.25; straight Texas steers 935@1,505 lbs. $4.30@5.10; native cows $2.30@4.50; heifers $3.25@4.90; bulls $3@4.25; stags $3.70@4 75; calves $4.56@6 75; and feeding cattle $3 60@4.70. A load of 1,822-lb. distillery-fed oxen sold at $4.60.

Bran—In moderate request sold at $11.50 per ton.

MILWAUKEE, Wis., April 3.—Butter—Creamery—Fancy prints, per pound, 20½c; extras 20@20½c; firsts 18@19c; seconds 16@17c; imitations, 15@16c. Dairy—Selections, per lb 16@18c. Roll—Fair to choice, fresh 13@14c. Prices unchanged, trade being fair and there is no accumulation.

Cheese—American full cream—Oct. Twins 11⅝@12½c. Brick—Oct. choice 12@12½c; winter made 11½@12c. Limburger—Fall, choice 9½@10c; winter made, 9c. Swiss—Drum, choice 12½@13c; block, choice, 10½@11c. Limburger weak, but other kinds are scarce and salable.

Eggs—Fresh, per doz. 11@11½c. Market ¼@1c lower, under heavy offerings, receipts amounting to 815 cases, largely Southern. Trade is quiet.

SHEBOYGAN FALLS, Wis., March 29—Cheese—At the second weekly meeting of the new Call Board here today, all the offerings, comprising 240 boxes of cheese, were sold as follows: 196 cases Young Americas at 10½c; 14 Daisies at 10¾c; 30 boxes Twins at 11¼c. Next meeting, Wednesday, April 5.

ST. LOUIS, Mo., April 3.—Butter—Steady; creamery, 18@22c; dairy, 13@18c.

Eggs—Firm; 10½c.

KANSAS CITY, Mo., April 3.—Butter—Steady; dairy, 16c; creameries, 14@19c.

Eggs—Steady; fresh, 10c.

CINCINNATI, O., April 3.—Butter—Firm.

Eggs—Quiet; 10c.

Cheese—Firm; good to prime Ohio flat, 11½c.

PHILADELPHIA, Pa., April 3.—Butter—Solid-packed separator, creamery extra, 22c; creamery firsts, 21c; creamery seconds, 19@20c; imitation creamery extra, 18c; firsts, 16c; seconds 14c; ladle packed, extra, 16c; firsts 15c; seconds 14c; print butter, creamery extra, 23c; firsts 22c: seconds, 20c.

Eggs—Pennsylvania and near-by, free cases, 12½c; do returnable cases, 12c: Western, 12½c; Southwestern, 12½c; Southern, 12c.

BALTIMORE, Md., April 3—Butter—Market firm; creamery separator, extra, 23@24c; creamery separator, extra first 21@22c; creamery firsts 20c; ladle extra 15@16c; Western store-packed 11 13c.

Eggs—Market firm, strictly fresh 11½@12c; duck eggs 15@17c per doz.

BALTIMORE MARKETS.

BALTIMORE, Md, March 30.—Butter—The receipts of separator creamery have been remarkably light since our last issue, with, however, a few of the best marks showing a slight increase; the shortage being clearly attributable to the diversion of floating lots that often come here, but occasionally are drawn off by reason of finding purchasers on the track at the primary points of shipping. The palpable inadequacy of the current make to meet the demand for this variety of butter drives some of the active dealers from the eastern cities to trespass upon the country at large, so for a time our supply of high grade creameries will be limited to the regular lots, unless our merchants exert themselves to overcome the efforts of their active competitors. Receipts of gathered cream products have been growing smaller and alarmingly less in volume week after week for some time, and the demand for them has been increasing steadily as the saved goods have disappeared from time to time; there are no lots of moment left in the freezers. Imitation creamery is in very light receipt, and with a brisk demand that is capable of absorbing more than comes on the market, sales are in the receiver's favor, and at the best quotations. There are very few ladles arriving, and those few are taken up promptly at fairly good prices, considering their defects in quality. No recent sales to exporters, for the reason that home traders need it all. Blocks and prints in moderate receipt, and find ready sale on arrival. Rolls are exceedingly scarce—receipts light; demand good. Creamery separator, extras, 22@23c; firsts, 20@21c; seconds, 18@19c. Creamery, gathered cream, extras, 19c; firsts, 18c; seconds 17c. Creamery Ohio, extras, 20@21c; firsts, 19@20c; seconds, 17@18c. Roll, extras, 14c; firsts, 13c; seconds 12c; W. Va. Roll, extras, 13@14c; firsts, 12c; seconds, 11c. Creamery Blocks (2 lbs.) extras, 23@24c; firsts, 21@22c; seconds 19@20c. Creamery prints (½ lb), extras, 23@24c; firsts, 20@21c; seconds, 18@20c. Md. Va. & Penna. prints, extras, 20c; firsts 18c; seconds, 15@16c.

Eggs.—The receipts continue quite liberal, but there is a good, steady demand, and all arrivals have been kept well cleaned up; at times the demand has exceeded the supply; our market today is steady at 12 cents. Duck eggs are in more liberal receipt, and the market is easy at quotations. Goose eggs are in fair supply: all full sized clean stock is promptly placed on arrival.

Cheese—Receipts light; demand good; market firm as quoted. N. Y. State—Cheddars, fine, 12@12½c; choice, 11@11½c; fair, 9@10c. N. Y. State Flats, fine, 12@12¼c; choice, 11¼@11¾c; fair, 9@9½c. N. Y. State, Small, fine, 12¼@12¾c; choice, 12@12½c; fair, 9¼@10c. Ohio Flats, fine, 11@11½c; choice, 10½@11c; fair, 8¼@9c. Ohio—Picnic, fine, 11½@12c; choice, 10@11c; fair, 9¼@10c. Swiss cheese, fine 11@12c; choice 10c; fair, 8½@9c. G. M. LAMB & BROS.

301 Exchange Place.

FOREIGN MARKET.

BOSTON, April 1.—Cable advices of this date from the principal markets of Great Britian to George A. Cochrane give butter markets as dull and entirely in buyers' favor, who are taking only for immediate wants. Although arrivals are moderate stocks appear to be ample for the demand. American creameries continue a dragging sale, little or none here good enough for the shilling cut, and to meet the demand for the ten penny cut means a loss for importers, who are not prepared as yet to meet this as better markets are looked for shortly, by some holders. Imitation creamery has had a good sale at 16@17c, and there is more doing in ladles at 15c downwards. Australian butter is pressed for sale, the finest of which is to be had at 20@21c, with very good value offering at 19@20c.

Cheese markets are all firm, but the keen edge is off for the moment, buyers resorting to purchases for immediate wants only. Finest Septembers are held at 11¼@11½c. Under prime cheese is very scarce and in good demand from 11c downwards.

A Good Cream Separator

THE BEST OF FARM INVESTMENTS.

McEwensville, Pa., Dec. 26, 1898.

"The 'Alpha-Baby' separator which I purchased about two months ago is giving perfect satisfaction. When the agent told me that we were losing a pound of butter to the cow each week by our crock system, I did not believe it. I am now inclined to say, like the Queen of Sheba when she viewed the riches of Solomon, that the half has never been told, for he never told me of one-half the actual benefit which the use of the separator would bring. This I discovered after one week's trial. People would hardly believe me if I were to give the entire truth of what the separator has done for me. I had been selling from 12 to 14 lbs. of butter per week before using the machine. There has not been one week since that I have not sold as much as 25 lbs. My records are very carefully kept and I have the figures to show for it. This certainly goes to show very decidedly that a cream separator is the best paying machine on the farm. It is like money drawing interest; it works rain or shine, Sundays and every other day. It pays a higher rate of interest on money invested than anything else in which a farmer can invest. It gives a clean profit every day in the year, while any other piece of machinery is only used for a couple of days throughout the whole year. It saves time, labor and money. There is no carrying or repeated handling, storing away or replacing of crocks and pans, no long and tedious washing of utensils, no fires to keep up for warming skim-milk for calves, and no sick calves on account of having fed them sour skim-milk. One more point is this, it will soon tell you which cow is a boarder and which is paying for her keep."

Very respectfully, T. F. MENGES.

READING NOTICES.

All Reading Notices under this head are at the rate of 25 cents per line.

For Sale—Son of Exile, dropped May 6th, 1895, good size, solid color and gentle. Tested dam and grandam. Bull calf six months, good per cent Exile blood, solid color, tested dam. A. D. McBAIN, Brockport, N. Y.

Wanted—Position by an all round dairyman. Can make cheese and butter. J. HEILKEMA, Holyoke, Ohio. 8-2

For Sale Cheap—Four richly bred Holstein bulls from one to twelve months old. R. L. WALLACE, Box 851, Knoxville, Tenn. 8-2

Hermanville Tamworths, Cross-heds, etc. J. A. MACDONALD, Hermanville Farm, P.E.I., Can. 32-52

An Entire Carload—Of high graded Jersey cows and heifers are in my hands for sale immediatley. F. H. MERRELL, Portage, Wis. 52-tf

For Sale—A very desirable and good paying dairy, consisting of 20 head, or more of Holstein graded cows; average milk sales of two hundred dollars per month. C. H. ELLIS, Waxahachie, Texas. 52-tf

For Sale—Holstein-Friesian bull calves of choice breeding. Will sell cheap if taken soon. For particulars address, JOHN SHUGART & SON, National Military Home, Ind. 7-6

The White Man's Burden is paying rent for a poor farm. Now is the time to secure a good farm on the line of the Chicago, Milwaukee & St. Paul Railway in Marinette County, Wisconsin, where the crops are of the best, work plenty, fine markets, excellent climate, pure soft water, land sold cheap and on long time. Why rent a farm when you can buy one for less than you pay for rent? Address C. E. Rollins, Land Agent, 161 La Salle St., Chicago, Ill. 7-2

To Exchange—320 acres good Texas land, located 15 miles west of Beaumont, on So. Pac. Ry, and 3 miles from station. Will exchange land for Holstein cattle. Address A. R. CROUCH, Granada, Minn. 6-4

Wanted—Position by a first-class butter maker, either in a factory or in farm creamery. Four years experience. First-class references. Wages reasonable. Address CHAS. E. DULLEA, Winthrop, N. Y. 7-2

For Sale or Trade—A creamery, as good as new, located in a fine dairy country in South Dakota. Will sell cheap, or trade for land, cattle or sheep. Address J. C. NIELSEN, Viborg, South Dakota. 7-2

For Sale or Rent—The Portage creamery, Portage, Wis. Immediate possession. Liberal terms to good party. WILLIAM FULTON, Prop. 5-tf

Wanted—Position is wanted as manager of a stock or dairy farm, by an experienced man. Would board help. Address LOCK BOX, 724, Malone, N. Y. 5-4

Wanted—At once, position on stock or dairy farm. Single. Experienced. Seven years at last place. References. Address F. R. R., care of Hoard's Dairyman. 8-2

For Sale—100 acres of land one mile from town of Crewe, Virginia. Crewe has 3,000 inhabitants. Norfolk & Western R. R., has its shops there. Also will sell milk route with farm. No competetion in milk business. $1,500 for both. Further information apply to T. O. SANDY, Burkeville, Va. 8-2

Wanted—20 bu. Cow Field Peas. Also 1 and hand tread power—1 h. p. W. S. CLARK, Ancona, Ill.

Position Wanted—By competent butter maker. 7 years experience in separator creamery. Can handle 9,000 lbs. of milk daily alone. Can keep books if wished. 6 years with one employer. Address L, care Hoard's Dairyman. 8-tf

Mistakes in Dairying.

[Paper read before the Kane Co., Ill. Institute, by H. B GURLER.]

Many of us are so constituted (unfortunately) that it is a source of satisfaction to talk to others of their mistakes. At the same time we dislike to talk about our own.

In what I shall say to you, this afternoon, nearly all the mistakes I shall talk about I have made myself, during some part of my experience in farming. I believe we can profitably talk about our mistakes. Opportunities are more interesting to talk about than mistakes, though they may not be as profitable.

Our mistakes are cold facts. Our opportunities may, and usually do, have some theories and considerable anticipation woven into them.

It is a mistake to keep a dairy that will not make an average of 300 pounds of butter per cow annually. Two hundred and fifty pounds should be the individual danger line. The cow that does not reach that point should be made to serve us in a line that she is evidently better fitted for, i. e., beef.

I believe $35 to be a fair estimate of the cost of feeding a cow a year. Now she must produce 220 pounds of butter to pay for this. When intelligently fed to calves and pigs, the skim milk will pay for the labor, or if labor is not taken into consideration, we may deduct its value from the cost of food. The skim milk from a cow that produces 300 pounds of butter, is worth $10. The average cow that reaches the 300-pound mark will produce 6,600 pounds of milk containing 4% fat. There will be 6,000 pounds of skim milk which, at 16⅔ cents per 100 pounds, will amount to $10. Deducting $10 from the cost of keeping, we have $25 left. The average price of butter for 1898 at Elgin was a small fraction of a cent under 19 cents. We will deduct 3 cents per pound for making, and we have 16 cents per pound net. It will require 156 pounds of butter at 16 cents per pound to equal the $25 balance against the cow for feed. Or, in other words, it requires 156 pounds of butter, and the skim milk to pay for the food. It will take 75 pounds more butter to pay for labor. This added to the 156 pounds makes 231 pounds. I believe this is a fair business basis.

Now I know it is entirely practicable to have our dairies produce 300 pounds of butter. Many dairymen have done as well and many have done better.

The Illinois Experiment Station selected a dairy in that vicinity that produced 300 pounds per cow for the year's work, and that is not a dairy section.

The 300-pound cow leaves us 70 pounds for profit which, at 16 cents per pound, is $11.20. A 350-pound cow leaves 120 pounds for profit, or $19.20, and the 400-pound cow leaves 170 pounds for profit, or $27.20; a 475-pound cow would make a profit of $41. There are cows that are making that amount. I have had grade cows pass the 500-pound mark.

I believe if we will set the boys to work testing the cows, giving them half that they can increase the butter production of the dairy as their pay, that we will make something ourselves, the boys will make something, and they will learn to respect the business and want to stay on the farm.

When we apply the trained thought and business sense to the farm that the manufacturer does today, it will pay, and we are going to give more and more thought to our various lines of work on our farms.

It is a serious mistake not to provide a palatable food for our cows. To secure this we must harvest our crops at the proper time, when they contain the most digestible nutriment. The palatability of food attracts my attention more frequently than any other in the management of my dairy. When the cows do not like their food, they will not consume as much as they should, and our profit is immediately reduced. Corn is the king of crops and clover is queen. These crops succeed each other most admirably in growing. A clover sod will produce 10 or more bushels of corn per acre than timothy sod. This extra 10 bushels of corn is clear gain, and it may represent all the profit there is in growing the crop.

Our queen of crops—clover—adjusts herself to the king—corn—more perfectly, if possible, in feeding than she does in growing. Corn is a highly carbonaceous or fat forming food, and clover is a nitrogenous food, and the best results are obtained when we feed a properly balanced food. Clover balances food to perfection. Our soil produces both of these crops successfully and profitably. Many of us make the mistake of letting our clover become too mature before we cut it. It should be cut when in full blossom.

It is a mistake to feed any kind of unsound food. Moldy hay, or corn fodder, or ground feed, decayed ensilage, all will cause trouble with the milk. I am confident that the greatest stumbling block with the silo has been from having too much surface exposed for the number of cattle being fed from it. Eight feet of surface, per cow fed, is the limit or danger line. Ensilage is a moist food, and will commence to decay when exposed a sufficient time, and we must feed fast enough to keep ahead of decay. Six surface feet per cow is sufficient to have exposed in the silo.

With this amount of exposure, and reasonable care, there will be no trouble from decayed ensilage. To illustrate this point, we will suppose a dairyman has 40 cows, 6 surface feet per cow would make 240 feet, or a space of 15x16 feet; in other words, 15x16 feet area is as much as should be exposed when feeding 40 cows. If a round silo is used (and a round one is preferable) 18 feet in diameter should be the limit for 40 cows. My latest silos are built circular and are plastered with Portlant cement inside. They cost me to build $1.50 per ton of contents. They are 20 ft. in diameter and 38 ft. deep.

Don't allow the cows to drink stagnant or impure water. It will affect the milk. I am confident it pays to warm the water in cold weather.

I formerly confined my cows in stanchions. I do not any more. I use the Bidwell and Drown stalls, in which the cows are not tied but held in a stall by a chain or rope across the rear. In these stalls the cows are lined up on the gutter and keep clean. They are much more comfortable than when in stanchions. The front of the stall is adjustable to the length of the cow, so she can be easily kept lined up on the gutter or drop. I use a continuous cement manger—the adjustable stall front hanging above the manger.

It is a mistake to be irregular about the hours of feeding or of milking, as it causes the cows to become restless and uneasy for which neglect we pay, commencing at the next milking. When the cows are allowed to shrink in their milk it is next to impossible to get them back to their former flow. It can only be accomplished by better care or better feeding than they received previous to the time they were neglected and allowed to shrink in their milk flow, and in case they are brought back by better care or better feeding, it is simply proof that we were not doing as well as we might have done previously, not doing as well as we knew how.

Never feed ensilage so that it is in the mangers at milking time. It is best to feed it after milking, and then there is no danger of the milk absorbing the odors from the ensilage.

The danger there is of milk absorbing odors is very poorly understood. I have known milk to bring the ordor of the hog pen to market with it and I was able to detect it and have the trouble corrected. If any one wishes a demonstration along this line, I advise them to set an open vessel of milk in some filthy place, allowing it to remain in that atmosphere about two hours. Then warm it to a temperature of 120° F., and try what your nose will find in it. I knew of a case in Vermont where a skunk had been disturbed in the vicinity of the milk room. Butter was made from this milk and sent to Boston to a commission house where the skunk was detected in the butter.

I am positive it is a serious mistake not to raise the heifer calves from our best cows. Here is where one of the benefits come from knowing each cow individually. The record of a cow's, and of her ancestors', work, as milk and butter producers, is just as valuable—yes, more valuable—than a record as a beef producer. We do not buy any other farm stock for breeders without looking up their ancestry, and the time is at hand when the record of dairy animals and their ancestors is looked very carefully after. We probably shall not be so anxious to trace every animal to its imported ancestors as we have been in the past—as we are awaking to the fact that we have improved on the original stock to that point that we now have in many cases better stock than that from which it descended—if not better than the stock of the countries from which we have imported in the past.

By this process of breeding from the best—from such as are profitable for a few generations—we can increase the profit to a surprising degree.

The manufacturers of this Congressional district (and we have many of them that we are proud of) are looking closely after all the details of their business—much more closely than we farmers and dairymen do. I think we have more opportunities to improve on our present methods than any other business I know anything about.

Dairy calves should be raised on skim milk—in fact I think all calves should be. I am positive we will secure the best cows from calves raised on skim milk. It will require more care and better judgment than when they are allowed to run with their dams. The calves must have this skim milk sweet—it must be as warm as the mother's milk (or 100° F.) and they must not be fed too much There are more calves injured by being fed too much skim milk than when one is not fed enough. Most of us understand the necessity for the young calf having the first milk from its mother. The calves can be worked gradually onto the skim milk—making it their entire food by the time they are from two to three weeks of age. Four quarts of skim milk twice per day is sufficient for the first month. Use flax meal to take the place of the cream.

We cannot afford to keep poor milkers. I have found a difference between my best and poorest milkers sufficient to pay a milker's salary when he milked 15 cows. Some men cannot milk well if they try, but there are more that do not try. When the cows have fallen off in their milk, it is less labor to milk them. I have given prizes to my milkers and secured very good results.

We cannot afford to have the cows unkindly treated. I get suspicious of a man when I discover that the cows are afraid of him. Remember that a cow is hurt or frightened when she kicks. Not one cow in a thousand kicks from ugliness, and this one I will guarantee has had the ugliness cultivated and developed in her by some ugly attendant. The cow is not to blame. I think a man that is ugly to cows should be compelled to fight it out with the male of the bovine family. Let him vent his ugliness on something of his own sex, that is, or soon will be, as ugly as himself. I have seen cases when I would really enjoy an entertainment of this kind.

Many dairy writers advocate feeding a grain ration when cows are on full feed of grass. I believe this would pay at the time, but I do not believe it would pay to feed a profitable cow in this way, one that we wish to keep in the herd for the double reason of her profitable work and for her offspring.

A cow should have no grain food during the time she is not giving milk or previous to parturition, as it gets her system in condition to cause milk fever. Feed her all she wants of some succulent or nutritious coarse food. A plenty of grass or ensilage is the best food at this time.

Cow stables should be well ventilated and well lighted. An English authority claims that cows will produce 50 cents each, per week, more in stables kept at a temperature of 63° than when kept at 52°. Many of us Americans will not believe this, but must remember that a cow that is giving milk is much more susceptible to cold than a fat steer. My belief is that we can use artificial

Eureka Harness Oil is the best preservative of new leather and the best renovator of old leather. It oils, softens, blackens and protects. Use

Eureka Harness Oil

on your best harness, your old harness, and your carriage top, and they will not only look better but wear longer. Sold everywhere in cans—all sizes from half pints to five gallons.

FARMERS, WHAT DO YOU SAY?

WILL THE WORLD GO HUNGRY?

This was the question asked by the Chicago Tribune of a recent date, when referring to a speech made by Sir William Crokes dwelling upon the problem of the world's wheat supply, Great Britain being able to produce only a small percentage of what she consumed.

REPLY:

WESTERN CANADA WILL PREVENT IT.

With millions of acres of excellent wheat lands in Western Canada awaiting the husbandman's efforts there is no fear of an exhausted supply. These lands owned by the Government are given free to settlers; near railways, schools, churches, &c. Particulars can be had on application to Supt. Immigration, Ottawa, Canada, or to

heat to advantage when we use it for the double purpose of securing warmth and aiding ventilation. I think here is a field for our experiment stations to work in. Who knows what is the temperature that gives best results in our cow stables?

As we have been talking of our mistakes we have been looking backward. Now let us change front and look forward, trying to see what opportunities there are as farmers and dairymen to do a more intelligent and profitable work. This will be largely a review on a different view of the same field. I am sure we have great opportunities along the following lines:

Applying the individual test to our cows and weeding out the unprofitable ones.

More intelligent work in crop growing.

Grow 100 bushels of corn per acre. Some have done this and more can do it. I tried and failed but consider my failure a success, as I produced 96 bushels per acre.

Grow more clover. Grow it for hay, for pasture, grow it to fertilize our land and fit it to produce 100 bushels of corn per acre. Remember that Queen Clover is the running mate of King Corn, and that while she is small in growth in comparison with King Corn, she produces nearly as much per acre of the most valuable nutritive element (nitrogen) as King Corn, and when we take into consideration the nitrogen secured in the crop and what she has stored in the soil for her lord and master King Corn—I am sometimes nearly persuaded that the Queen is of more service to us than the King. She is much underestimated, without doubt.

Study the feeding problem—how to prepare a properly balanced ration.

Send to University of Minnesota for their bulletin on feeding dairy cows, by T. L. Haecker. Address, St. Anthony's Park, Minn.

Study the question of palatability of stock food. This will pay you well.

Supply pure water. Fence the stock away from the stagnant and impure water.

Provide plenty of light and fresh air for the stables. If you have no system of ventilation—put in one. It need not be expensive.

Demand and secure a high grade of work from your milkers. Discharge a man that persists in being unkind to the cows.

Secure a pure atmosphere about milk, cream and butter.

Establish a business-like system about all the work.

Feed ensilage after milking.

Don't have the hog pen too near the cows as its aroma at times is alarming.

Raise the heifer calves from the cows that produce 300 to 500 lbs. of butter annually.

Don't forget that a better dairy calf can be grown on skim milk than on whole milk, and at much less cost.

Remember that the greatest cause of scours in young calves is over feeding, and that boiled milk will check it if taken in time.

When we are weeding out the unprofitable cows let us do the same to the milkers.

Remember it pays to treat a cow like a lady.

Get rid of the cows that cannot be cured of kicking, as they contaminate the whole stable.

An Interesting Letter From Nova Scotia.

Criticism, Report, Inquiries.

ED. HOARD'S DAIRYMAN:—I have been a reader of the DAIRYMAN for a little less than a year and have gotten a great many ideas as my eyes have glanced over the dairy types and points for a good milker, the balanced ration, the veterinary column and also the general remarks in reference to dairying and the care of the stock; but I have not seen many items from Nova Scotia, so I thought you would put up with one more inquiry, coming, as it does, from a place not often heard from in these columns, but doing good work all the same in the production of fruit, agricultural and dairy products.

We have a combined butter and cheese factory in the town about half a mile from where I live, that is run the year round and turns out a superior article, due in a large part, to our competent and obliging manager, Mr. F. M. Logan, who, by the way, is one of our own men and as competent as any one we could import, even from our cousins across the line.

You Americans, Mr. Editor, judging from the general tone of your newspapers, are inclined to think that you are rather smarter and a good bit ahead of all others, which perhaps is all right in your own country, but when that sentiment crosses the boundary we, if we swallow it at all, do it under some protest.

But pardon me, we are off the subject. The factory is owned by the patrons, and manufactured into butter and cheese, during 1898, between 700 and 800 tons of milk which sold for $14,821.00. The patrons received for last quarter, 16¾ cents per pound for butter fat.

I have no doubt the general run of our cows might be vastly improved but some of us are trying to learn.

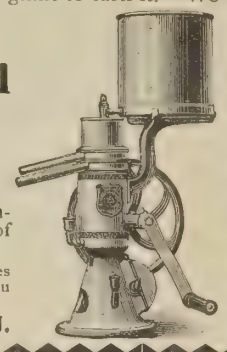
We are at a disadvantage as to feeding stuffs, some of which have to be imported or shipped a good distance which adds too much to the cost. And just here comes in the inquiry for the cheapest and best balanced ration from the following feeds:

Plenty of good clover, timothy, and daisy hay, mixed or separate, at $7 per ton, oats (ground) at $24, buckwheat or barley at $22, bran $20, corn meal $23, cotton seed meal $25, middlings, about $21, also plenty of turnips and mangels.

Please throw out whichever of these you think are too expensive for profit. The cheapest balanced ration is what we want.

Now, Mr. Editor, this letter is already too long but perhaps you will hear from me again. C. S. FITCH.

King's Co., N. S.



We take no exception whatever to our friend's good natured rebuke of our national pride of opinion. If it is a vice at all, it is one leading very preceptibly to virtue's side, and is not without its benefits and blessings. There is one characteristic which we think obtains more universally in the United States than in any other country on the globe, and that is a willingness to learn from others, and adopt foreign methods of proven excellence. We have learned a good many good things from Canada, and expect to learn many more, as the years go by. And Can-

A Hand Separator

to be profitable must not only extract every particle of butter-fat from the milk, but must run so easily that it does not require the strength of a giant to turn it. We guarantee the

Empire Cream Separators

to run 50 per cent. easier than others of equal capacity. Their record for clean skimming is unequalled. We have the most complete line of hand separators in America; also power machines.

We have not space here to tell you why the **Empire** machines excel all others, but it's all in our catalogue. Send your address if you have one cow or one thousand.

ada has the good grace to admit that many good things and ideas come from this side of the boundary line,—for example, the Babcock test and the special-purpose dairy cow.

We should certainly omit from the list of feeds given, the oats, barley, buckwheat, middlings, and possibly corn. Clover hay and cotton seed meal are the cheapest of the feeds, and we should place main reliance upon them, using the bran mainly as a diluent for the cotton seed meal. If the roots can be pulped, and the grain fed in connection with them, we should say equal parts by weight, of the bran and cotton seed meal, but if not, then 2 pounds bran for each pound cotton seed meal. The roots may be used up to 25 to 30 pounds per day; the grain from 4 to 8 pounds, according to the ability of each cow to respond, and all the hay any cow will eat.

Mr. Wheaton's Canadian Dairy Notes.

Success in Dairying.—Low Prices.—Canadian Cheese Trade.—Shrinkage in Production.—Fodder and Fresh Grass Cheese.—Feed and Care of the Calf.—Foreign Markets.

ED. HOARD'S DAIRYMAN:—The farmer who once launches out into dairying, and sticks to it, year in and year out, is sure to make a success of the business. When low prices come, many dairymen often become discouraged and contemplate engaging in some other calling, but if they would only have patience for a year or two, a reaction is sure to take place, followed by good prices and a brisk demand for the product. No other branch of agriculture drops in price and recovers again so quickly as dairying, and especially the cheese making branch of it. A year ago at this time, the prospects for the coming season were gloomy, and the outlook for fair prices not at all bright.

This year almost the very opposite conditions prevail, and the dairyman, who last summer was discouraged and felt like giving up the business, has a prospect before him that should guarantee good prices for cheese the coming summer. And so the man with patience and a determination to stay in the race is sure to have his reward in due time.

This has been characteristic of the Canadian cheese trade, ever since it started, so our oldest dairymen tell us. This fluctuation, or a season of low prices, followed by one of high prices, has taken place a number of times, to the benefit of the man who makes a business of dairying and is not a dairyman for the moment. One may ask why this is? Dairy products, more than anything else perhaps, are governed by the law of supply and demand. When the supply is large, and there is an overproduction, the price will fall the same as with any other product. But there are not many products that will recover so quickly. Dairy products are perishable products and must be consumed within a reasonable time, or else they will deteriorate very quickly in value.

The goods must be sold whether or no, and when they are put upon the market at a low figure or at slaughter prices, the consumption quickly increases, and the supply as quickly decreases, bringing about a normal condition of affairs with its accompanying good prices. So we say to the dairyman, do not become discouraged when the clouds appear and prices get near the profit line. The clouds are sure to disappear and the sunshine of good prices to return very soon.

This can not be better illustrated than by a reference to the Canadian cheese trade. As most of the readers of the DAIRYMAN know, all our surplus cheese finds a market in Great Britain. That country imports annually about $25,000,000 worth of cheese, of which Canada supplies about 64% or $16,000,000 worth. And this is about all we can supply without forcing the market too much and causing a falling off in price.

When we produce very largely, as was the case in 1897, we have more than the market can take, and consequently have to pass through a season of low prices, as was the case in 1898. But as every dairyman well knows, on account of the low prices of 1898, the make in the factories fell off considerably, with the result that at the present time we are about 250,000 boxes short in our shipments, as compared with 1897, and with a better outlook for prices at the opening of the season, than for some years back.

The shrinkage is not all in Canada however. The shipments from New York show a decrease of over 300,000 boxes, making a total decrease from Canada and the United States as compared with a year ago, of fully 550,000 boxes. This shortage in the make of one season, connot help but decide the situation in favor of the producer.

Last week, March 25th, at Montreal, 11 cents was offered for cheese and refused, and dealers who are so fortunate as to have a good supply on hand, though the number cannot be very large, will emerge from the season's trade with good bank accounts to start next season's business with.

But there is a feature of the situation that it would be well to draw attention to just here. This bright outlook will, undoubtedly, induce many of the factories to open up earlier, than they otherwise would, and to produce a large supply of fodder cheese. Even if the price is good, this may not be the best thing for our dairymen to do.

This early cheese, which from the conditions prevailing in the way of fodder feeding and factories not properly fitted to make or cure the product, must, of necessity, be inferior in quality to that made when the cows are on fresh grass, and when sold in Great Britain as Canadian cheese, will injure the sale of the better quality later on.

If our dairymen would come to some definite understanding in this mattter, and keep the market clear of this early fodder stuff, they would have as much money at the end of the season, and there would be no danger of the market being interfered with before the better quality was ready to be marketed.

Even if there were no danger of this early stuff injuring the sale of the later made stuff, we think it would pay our dairymen to continue on making butter till about the middle of May, at least. Even if the price of cheese is as high as it is likely to be this spring, it will pay the dairyman better to make butter, and have his skim milk at home to feed his calves, than to send the whole milk to the cheese factory, and attempt to raise his calves on other foods. The feed and care the calf receives during the first few months of its existence is usually the making of the future cow.

It matters very little about the breeding if the feed and care of the calf in its early days are neglected. The advice given to dairymen to-day, to build up a dairy breed is to select his best cows, and breed these to a good bull of the best known dairy strains,
